that every person in the company will be capable of doing them immediately for their amusement. First, to tell any lady or gentleman the card that they fix on, without asking questions. Second, to make a remarkable piece of money to fly out of any gentleman's hand into a lady's pocket-handkerchief, at two yards' distance. Third, to change four or five cards in any lady's or gentleman's hand several times into different cards. Fourth, to make a fresh egg fly out of any person's pocket into a box on the table, and immediately to fly back again into the pocket.' In his latter days, Breslaw offered to teach sleight-of-hand for a reasonable fee; and finally, on retiring from the profession, he, in 1784, published a small book explanatory of his conjuring tricks and apparatus.

At this time and a little later, conjurers did not in popular appreciation rank much above the grade of mountebanks. They still wore fantastic dresses, and made use of cockalorum, hocus-pocus, presto, begone, and other ridiculous jargon. The first who, in giving a tinge of science to the art of legdemain, rose to the character of a philosophic conjurer, was Katerfelto, who has been immortalised by the poet Cowper:

Katerfelto with his hair on end
At his own wonders, wondering for his bread.

Katerfelto was the son of a Prussian colonel of hussars. He had received a good education, but being of an erratic turn, he took to conjuring. After travelling for some years on the continent, giving entertainments at different courts, he appeared in London about 1781. With his tricks were intermingled harangues on mathematics, optics, magnetism, chemistry, hydrostatics, and other sciences. To aid his mystifications he exhibited a black cat, which was reputed to possess some wonderful qualities, which he took care to puff in the newspapers. The puff was of course anonymous. Sometimes it consisted of dreadful insinuations against the character of the black cat, which was represented as a demon in disguise. Having wrought up the public mind on the subject, Katerfelto would come out with an advertisement per contra, denouncing the disregard of truth in speaking of himself and his clever but very innocent cat. For instance, he issued an advertisement as follows: 'Katerfelto is sorry to find that writers [that is to say, his own puffs] in the newspapers have several times, and particularly within the last fortnight, asserted that he and his black cat are devils. On the contrary, Katerfelto professes himself to be nothing more than a moral and divine philosopher, a teacher in mathematics and natural philosophy; and that neither he nor his black cat bears any resemblance to devils, as they are represented in the print-shops; and assures the nobility and public that the idea of him and his black cat being devils arises merely from the astonishing performances of Katerfelto and his said cat, which both in the days' and nights' exhibition are such as to induce all the spectators to believe them both to be devils indeed!—the black cat appearing in one instant with a tail, and the next without any, and which has occasioned many thousand pounds to be lost in wagers on this incomprehensible subject.'

Philip Astley, noted for his equestrian amphitheatre, is said to have begun life as a soldier, in which capacity, when on foreign service with his

regiment, he demonstrated his ability as a conjurer, by inventing the now famous gun-trick. This consists in pretending to fire a pistol loaded with ball, and catching the ball on the point of a knife. The explanation of the trick is, that in the first place the pistol is secretly loaded only with blank cartridge. In this harmless condition the conjurer slips into it a tin tube, which nicely fits it, and then ostentatiously loads it with ball. Before firing, the tin tube is dexterously removed, and when the weapon is fired, no harm ensues; by an instantaneous manœuvre the bullet is triumphantly exhibited as being caught in the required situation. It is related that Astley invented the trick to save the effusion of blood at the duel of two comrades in the army, for one of whom he acted as second. Succeeding in getting the other man's second to assent to the ingenious device, the duellists fired at each other without effect, and the affair was amicably adjusted. Very clever this. One night, however, say with Sir Walter Scott in his *Lay of the Last Minstrel*:

But scarce I praise their venturous part
Who tamper with such dangerous art.

Mr Frost mentions two instances in which the gun-trick proved fatal. One was that of a conjurer in Dublin who was shot dead, by the accidental substitution of a real loaded pistol for one in which the charge was withdrawn. The other took place in Germany, at the performance of a conjurer named De Linsky. He set up his wife to be fired at by six soldiers, each of whom was to bite the ball off his cartridge in charging his gun. Needless, one of the soldiers did not bite off the ball, and Madame de Linsky was shot through the body. She died on the second day after the accident. The catastrophe clouded the latter years of the unfortunate conjurer.

Balsamo, a native of Sicily, who assumed the name of Cagliostro, flourished as a conjurer, or, more properly, as an impostor, about the year 1780, but was better known on the continent than in England. He did not confine himself to sleight-of-hand, but pretended to cure diseases, and to make old people young again. His fate was unfortunate. While in Paris, he was confined for some time to the Bastille, on suspicion of being concerned in the robbery of the famed diamond necklace of Marie Antoinette. Getting out of this scrape, he went to Rome, where, on account of his conjuring operations, he was condemned to death as a magician, but died in prison in 1795.

Some of the tricks of Cagliostro had in them a trace of science. He dealt in optical illusions; and although he was a regular charlatan, one cannot but regret the cruel way he was treated. By two successors, Comus and Robert—a couple of Frenchmen—tricks by means of concave mirrors were brought to considerable perfection. Performing in Paris, M. Robert declared he could raise from the dead any person whom the company pleased to name. It was proposed that he should bring up the spirit of Marat; and truly enough a phantom resembling that hideous revolutionary monster made its appearance, and immediately vanished. Effects of this kind, aided by a subdued light and some ghastly paraphernalia, are produced by the agency of lenses, concave mirrors, and miniature likenesses of the persons represented. In fact, much of the so-called

manifestations of modern spiritualism may be explained by optical illusions, such as were practised by M. Robert and his brother-conjurers.

We cannot, even in the briefest way, refer to the crowd of conjurers who, in later times, have entertained and astonished the public with their tricks. Only a few can be noticed. One of these was the well-remembered Anderson, a native of Aberdeenshire, who designated himself Wizard of the North. It is a rare thing to find a Scotchman filling the rôle of a showman, an actor, or a conjurer. Rising from a humble position, and poorly educated, Anderson began his career as a call-boy in a theatre, and with an aptitude for sleight-of-hand, along with a proper amount of audacity, he took up the profession of a conjurer, beginning with entertainments in small towns, and working his way up to high-class assemblages in London and elsewhere. He established his popularity by the neat and quiet way in which he performed a variety of new and bewildering tricks. In his later days he issued a kind of memoir of his life, from which, as we suppose, Mr Frost has drawn the following incident.

In the course of a professional excursion in the north, he visited Forres, and by the advice of his printer, took lodgings for a week at the house of an elderly widow, who expressed a wish that he should pay half the rent beforehand. Anderson made no objection, and handed her four half-crowns. Observing the words 'Great Wizard of the North' on the handle of his umbrella, the woman in trepidation asked who he was. On being told that he was a wizard, she ordered him to quit the house. At this moment the stage-coach was about to pass the door for Elgin, where the wizard had an engagement. As he was hurrying away, the woman threw his money on the floor, and fell down in a swoon, hurting herself in the fall. Some persons rushed in on hearing the fracas, and seized Anderson, to prevent his escape. Just then the coach drew up, and the driver was told that a murder had been committed. 'Leaping down, and looking through the window, he recognised Anderson, whom he had seen several times in Elgin. The coach started again; and Anderson, finding that he was in an awkward position, as the old lady gave no signs of life, demanded to be taken before a magistrate at once. This he was told was impossible, as there was no magistrate within seven miles; and all that could be done was to lodge him in the town jail until the next day. To the jail the conjurer was taken, therefore, between a couple of constables, who were commendably prompt in making their appearance. The coach went on to Elgin, where the guard lost no time in spreading the news of the Wizard's arrest, and going to the Assembly Rooms, told the audience, who were growing impatient at the conjurer's non-appearance, that "they might conjure for themselves that night, for there would be no Wizard, as he was where he would not get out with all his magic; he was in Forres jail, for murdering an old woman." A thrill of horror ran through the crowded auditory; then a murmur arose, and loud demands were made for the return of the money paid at the doors. This was done; and nothing was talked of at Elgin that night but the horrible murder at Forres. On the following morning, Anderson was conducted to the residence of the magistrate, where the widow, who had

recovered in the course of the night, told as much of the tragic-comical story as she knew. The gentleman who administered justice in that remote district smiled at the old lady's narrative, reproved the witnesses for their hastiness, and at once discharged Anderson, with an expression of regret for the inconvenience and loss to which his detention had subjected him. The news of the *dénouement* of the affair reached Elgin as soon as Anderson, for whom it proved an excellent advertisement, bringing crowds to the Assembly Rooms, and inducing him to prolong his stay in that town several nights beyond the term he had intended.

Anderson deservedly made a fortune by his performances at home and abroad. While in the United States he discovered the impostures of the Spiritualists that were driving people mad, and relentlessly exposed them in his entertainments. 'I caused my table,' says he, 'to rap as loudly and intelligently as theirs, while I hesitated not to reveal the nature and *modus operandi* of the "spirits" which produced the rappings.' For this good service he deserved the thanks of society. Anderson died two or three years ago.

Every one knows that jugglery is carried to a high pitch of perfection by natives of India. We have some notice of their marvellous tricks in Mr Frost's entertaining volume. The Chinese are also clever at conjuring, especially as regards sleight-of-hand. A few years ago we saw a Chinese perform a dexterous manœuvre, which it was painful to witness. He appeared on the stage with his belt stuck full of table-knives with sharp points, and was accompanied by his son, a boy of nine or ten years of age. Placing the boy against a broad wooden plank, he began, at the distance of six feet, to throw knives at him; causing these sharp instruments by a particular jerk to stick in the wood all round the boy. The feat was rapidly executed, but with apparent ease and indifference. Not one of the knives touched the boy, though some of them stuck in the board very near him. As they were projected with considerable force, any hit would have been fatal. The reflection raised at sight of this extraordinary exhibition, was that the man must have spent half a lifetime in training his hand and eye for the performance. Hazlitt, it may be remembered, has an interesting essay on the dexterity of Indian jugglers in throwing up a number of balls and catching them successively, and the enormous amount of study that must have been expended in attaining such proficiency. Everybody will say that the loss of time in studies of this nature is most wasteful. But looked at broadly in relation to natural aptitudes, it would seem to be pretty much a matter of taste whether a man shall spend seven years in learning to poise perpendicularly on the point of his nose a tall stick with a dinner-plate pironetting on the top of it, or in qualifying himself for one of the learned professions. Conjuring, possibly, 'pays' as well as anything else.

We occasionally see clever conjurers of the mountebank order in the by-streets of London—the police taking care to keep them out of the main thoroughfares—but they are far and away excelled by the conjurers who establish themselves for popular entertainment behind little tables in the Champs-Élysées. We are inclined to think that, somehow, conjuring comes natural to a Frenchman. He possesses the requisite amount

of light-heartedness and loquacity. In Paris, conjurers are a kind of *artistes*. They are asked to attend festive parties for the general amusement. When the Duke of Wellington, at the head of the allied army, was supreme in Paris, immediately after the battle of Waterloo, he invited a large evening-party to the mansion he occupied in the Place Louis XV. On consideration, he found that the house could not contain all who were expected to attend. 'Cover over the garden,' said a friend whom he consulted, 'and invite a conjurer to entertain the company.' The hint was taken; and through the performances of the conjurer in the garden, the party went off with immense *éclat*. This incident was related to us by the late Mr James Simpson, an Edinburgh advocate, who visited and wrote about the field of Waterloo, and had the good fortune to be present at the famous garden-party of 'Le Grand Wellington,' as the Parisians were pleased to call him.

Among the later conjurers of note, there have been several foreigners, Döhler, Frikell, Bosco, and Houdin—ordinarily called Robert-Houdin. We happen to have seen them all, and in particular can speak with approbation of the elegantly adroit performances of Houdin. This clever Frenchman, who spoke English fluently, travelled about with his wife, who was an accessory in his entertainments. For example he would declare that Madame, while seated blindfold in the middle of the stage, would describe any small article that was handed to him. Responding to his request, one of the spectators would hand him a brooch, another a ring, a third a pencil-case, and so on. Every article was faithfully described to all appearance by the blindfolded lady, which caused no small degree of wonder; but in reality she never spoke at all. She only moved her lips; while her husband, holding and looking at the article in his hand, by means of ventriloquism caused the words to come apparently from her mouth. The trick was exceedingly well performed.

In the course of his travels, Houdin visited Algiers, and there astonished the native Arabs with his performance of the gun-trick, which he did in a way somewhat peculiar. At one of his entertainments an old Arab admitted that Monsieur was doubtless a great magician, but he should prefer to use one of his own pistols. Houdin said this might be done next day, after he had invoked the powers to assist him. It was a severe trial of skill, for there was some danger in dealing with a wary and suspicious barbarian. Next day, the exploit came off. Houdin only stipulated that he should be allowed to load the pistol, the Arab handing him a leaden bullet from a saucerful from which to make his choice. This was agreed to. Houdin, as every one thought, dropped the leaden bullet into the pistol; but instead of doing so, he dropped a previously prepared sham bullet, which dissolved into dust on being fired. 'Now,' said the conjurer to the Arab, 'take the pistol, and fire at me, and I will catch the bullet in my mouth.' The pistol was fired; and to the profound amazement of the crowd of Arabs, Houdin took a leaden bullet out of his mouth, which all admitted to be the bullet that had been selected from the saucerful. To still further astonish the company, Houdin declared that by loading with another leaden ball he would bring blood out of a stone wall. All were eager to see this wonderful feat. It was

performed in a way differing little from what had already taken place. Instead of dropping a real ball into the pistol, Houdin used a sham bullet filled with a red liquid, which dissolved on striking the wall. Wonder tremendous! We believe that Anderson in his gun-tricks was similarly in the habit of substituting light composition balls for real bullets, and was equally successful. It was all a matter of sleight-of-hand.

The latest and most surprising piece of Natural Magic has been what is usually called Pepper's Ghost, though it was exhibited years previously, in Paris, by the French conjurer Robin. The thing, however, is so simple and so obvious that we cannot doubt it had been employed—perhaps imperfectly ages ago in the conjuring repertory. Every one must have noticed a very ordinary phenomenon. A fire burning in a room is at a certain angle reflected in the glass of the window. Passing through the glass, the rays are refracted or bent aside, and the image of the fire is seen blazing on a bush or other object outside. Such is the principle on which the so-called Pepper's Ghost is made a subject of wonder to an assemblage of people. Shrouding the lights, to give the required dimness, a glass screen is lowered in front of the stage, on which the ghost is to appear; the ghost being nothing more than the reflection of a person performing out of sight of the spectators—probably at a point in front of the glass, or even under the stage. The recent manufacture of large sheets of plate-glass has immensely facilitated the trick. As none of the spectators, on account of the crepuscular light, can see the glass, the simulation is complete. A ghost seems to be walking about the stage, which the actors affect to see or to grasp, of course without effect, and the marvel is to all appearance incomprehensible. On the like principle, is sometimes shewn a 'magic heal,' which answers questions, also a variety of other tricks or optical illusions. W. C.

FALLEN FORTUNES.

CHAPTER XXV.—SECOND CLASS.

THE divines talk to us of 'precious time;' and from their point of view, no doubt our time should be more precious, and we should be less willing to waste it, than gold itself. Business men also protest with more or less of truth (generally the latter) that their time is precious, and would have us believe that every quarter of an hour by which their morning train is delayed costs them, or their clients, thousands; and even outside those two callings, there are many instances in which the passing hour may be designated by the same endearing epithet. But after all, there is no time so precious to the human heart as that which intervenes between the signature of the death-warrant of some beloved fellow-creature and the carrying it into effect. When the kindly doctor is compelled to whisper, 'No hope,' and husband, or wife, or child lie on that bed which they will for certain only exchange for their place in the churchyard, then time becomes precious indeed. How we grudge every moment that we are forced to pass away from that beloved object whom we shall never, never see again! How we feel that a week hence, or a day, we shall bitterly regret the hours—cumulatively years—that we have lived apart from them, out of their sight, beyond their voice and touch, when we

might have been in their company. How every stroke of the clock sounds like a parting knell! And thus as the time drew on for John Dalton to set sail for Brazil, each day became inexpressibly clear and all too brief for his unhappy wife. It was a long journey, full of doubt and hazard, even for him; but for her it was the longest that mortal man can take; for she knew well, though no tongue had told her, but only the wordless whisper of her own prescient heart, that she would never behold him more in this world. Her health had been failing her for long, though no one knew it beside herself; she had been always one to make light of her troubles, in order the better to persuade others to let her help them to bear their own; 'her worst she kept, her best she gave' of everything; but she had for some time looked forward to her coming trial with a grave suspicion that her strength was insufficient to meet it. And now this crushing blow had fallen, and she felt that it had paralysed all her rallying powers; her courage remained with her—it was necessary for others, and therefore only death could rob her of it; but her vital energies were gone.

Hers was not a solitary case. Doubtless, while I write these words, there are hundreds, perhaps thousands of women, wives and mothers, who know that their fate is sealed, but keep the secret to themselves, for others' sake, and look upon the passing world with smiling serenity. Another autumn, perhaps even another winter, they may see on earth, but not another spring. They hear plans made for the future which include themselves, and they appear to fall in with them. They will not cast a shadow over the present happiness, the present hope of those around them; but they are well aware, by the time of which these loved ones speak with such unclouded assurance, that in this world they themselves will have become a memory. Such miseries are strewn broadcast in our homes. But Mrs Dalton's case was worse than most. She was not only sentenced to leave all she loved, and step into the unfathomed gulf of death alone, but to leave them in sore straits. Moreover, the little span of time during which her husband was still to remain with her was treasured upon by the necessity of his going to town, and making arrangements for the disposition of his property—or rather of what *had* been his before their ruin. He was bent upon being absent from Riverside as little as possible, but a 'monstrous cattle' of at least three days was thus cut out of the bare fortnight that still intervened before the sailing of the ship. Of course Edith might have accompanied him to London, but she shrank from expending the few pounds that this would cost upon her own pleasure or comfort. Every moment that could be passed in his company was now priceless to her, yet ten thousand of them were now foregone, for the sake of a few shillings. Such is poverty, which fools make light of, and liars praise for its wise teachings, and which rogues and scoundrels dare to flout at and despise.

Edith could, however, accompany her husband to the station without expense, since he was conveyed thither in one of the Riverside equipages; and this we may be sure she did.

'I shall take a second-class ticket, my darling,' said he as they drew near their destination. His tone, if not that of a martyr, had something of serious self-sacrifice in it.

'Oh, must you?' returned she pleadingly. She

did not like the notion of 'Dear John' going by the second class; though for herself, if she could have gone with him, she would cheerfully have travelled in a cattle-truck.

'Yes; I think so. One can't begin to economise too early, as that woman said last night. The idea of her giving you such advice, at such a time!'

'It was very wise advice, John.'

'Very likely; but I wish it had choked her. However, I am going to follow it, you see. It is lucky I did not bring down Toffet with me' (Toffet was his valet), 'as we originally intended, or it would have been rather unpleasant: I mean, for him and me to travel together.'

'It would have been impossible, my dear.'

'Oh, I don't know; one soon gets used to these things. I daresay I shall have worse company than Toffet on board the *Flamborough Head*; for I am quite resolved to go in the steerage. It is a matter of twenty pounds—the difference is—and that twenty pounds will be of use to you at the Nook, you may depend upon it.'

'Don't talk of it, darling; not just now,' murmured Edith, with her head upon his breast: 'it has not come to parting yet. You will be back amongst us on Tuesday.'

'Yes, my pet, on Tuesday, at latest, if I can only get those lawyers to move out of their snail's pace. There is the auctioneer, too, to see about the lease. I have great hopes that the house will have improved in value since we took it. I think I shall take Skipton's bid for the horses, so that that matter can be arranged at once; and he entered some memoranda in his note-book. How she envied him the many practical matters he had to deal with, the transaction of which must necessarily engross his thoughts. In the day of trouble, women's work is of little value to them as a distraction from care; the occupation of the hand, or even of the mind, affords but small relief; a certain sort of action is invaluable at such seasons. 'That pompous and pretentious arrangement for the transaction of affairs, called Business,' becomes then of real importance, and only men are able to avail themselves of it. This is fortunate, since they are certainly less able to endure 'worry' than the softer and sereener sex. Annoyances of any kind had always irritated John Dalton to an extent quite disproportionate to their importance; but, under the present circumstances, the least vexations galled him.

Though he asked for a second-class ticket at the station, the clerk—who knew him well—gave him a first from habit; and this had to be exchanged, to the wonder not only of the official, but of the various passengers in the waiting-room, to whom the Riverside liveries were familiar. Both eminent and wealthy persons are found sometimes to use the second class; but Mrs Campden would have felt it a slur upon the reputation of her house if any guest had arrived or departed from it in so ignoble a manner. And in this particular at least, Dalton would have satisfied her expectations; he had always been accustomed to the best of everything—never to the second best. He had never been in the pit of the opera, or put up with the accommodation of a coffee-room at an hotel. When he had journeyed, it was always in a luxurious manner, with piles of newspapers or heaps of railway books, which he had as often as not left in the carriage behind him, when they had served his

object of making the hours of travel move more quickly. But he was resolute now to adopt the most rigidly economical habits, and having omitted to bring a book with him from Riverside, was therefore compelled to feed on his own thoughts throughout the journey, or to enter against the grain into conversation with his fellow-travellers. They stared at him because a livery servant had opened the door of the carriage for him, and handed in his railway rug, but not more than the servant himself had stared when Dalton had said 'second-class, William.'

Perhaps nothing so brought home the fact to the Riverside household that 'them poor Daltons' were really ruined, as the tidings of this simple change of travelling carriage. 'Just think of Mr Dalton, 'im as has just been stannin' for Bampton, sitting cheek by jowl with Scarve, the Bleakarrow undertaker, and that 'ere 'prentice of his, Tompkins!' who happened to be going on a professional expedition by the same train. Tompkins, who was educating himself to be a mule, was just the sort of companion Dalton wanted, if he must needs have any; but Scarve was lugubriously loquacious. Under the influence of a flask of gin which he carried about with him, as he explained, as a precaution against infection, he grew very communicative about his 'jobs with the aristocracy,' of whom, if his word was to be credited, he had put a sufficient number under ground to make a House of Lords in the other world. 'I don't say but that there is firms in London as can bury as well or better than ourselves,' he whispered confidentially to Dalton; 'but in the country, Scarve & Co. yield to none.' When he got out, he pressed his card—it had a neat black border of about two inches broad, and a tomb in the centre, on which were inscribed his name and address—upon his fellow-traveller's attention; and though at first amused by it, it presently began in his mind a ghastly reflection. Supposing, when he himself was far away, anything should happen to Edith, or any of the children, would a man like that—perhaps the very man himself—be sent for to the Nook to bury them? A morbid and monstrous thought, as he was well aware; but the knowledge of his own weakness availed him nothing. He beheld his little family, overshadowed by death as well as ruin, ministered to by hireling hands, forgotten and forsaken by friends, while he himself was thousands of miles away. It was the only time that he had dared to say to himself concerning any of his dear ones, 'They will die, perhaps, in my absence; their welcoming faces shall greet me never more.' As for himself, he felt too thickly clad in misery to be pervious to the shafts of Death; he could not lose *them* that way; but he felt that they might well leave *him*—Edith, who was so delicate, or Jenny, always an invalid—and then this man would come and see the last of them. It was an inexpressible relief to him when Mr Scarve and his assistant quitted the train, and with the most dejected faces climbed into a dog-cart, that was in waiting for them, driven by a groom in mourning.

To them succeeded an unmistakable commercial traveller; 'money and orders' were written in his twinkling eyes as legibly as the Hebrew characters that were wont to be seen (by the faithful) inscribed upon those of some pious folk of old. He was a chirpy gossip fellow, full of

Joe Millerish jokes, and very inquisitive. He was very curious to know 'who' Dalton 'travelled for,' as he expressed it.

'A family man, I presume?' said he. Dalton nodded in good-natured assent. 'Ah, then you are quite right to come second-class, sir; I always do it myself, and save the difference for Mrs R— (my name is Roberts) and the young people.' Presuming upon his superiority in years, he was so good as to give his companion much advice as to the pursuit of his supposed calling. 'My motto is *push*, sir'—which he pronounced like 'rush'—and I have always found that system to answer.' And by way of illustration, he dug the would-have-been member for Bampton playfully in the ribs.

Without being at all of the opinion of that modest philosopher who averred that he never spoke with any fellow-creature without learning something new, Dalton was by nature social and a citizen of the world; so that not only did Mr Roberts' conversation speed the leaden hours of the journey, but the two parted the best of friends.

'You are the right sort, *you* are,' was the eulogium passed upon him by that gentleman on the platform as they shook hands. In the midst of which leave-taking, up came Dalton's footman to shew him where the carriage stood.

'Well, I *am* blowed,' said Mr Roberts, with a prolonged whistle.

He did not know, of course, that it was the last drive in his own carriage which his late fellow-traveller was ever to take.

BLIND FISHES.

AMONG the curiosities of Natural History are certain animals wholly blind, which, nevertheless, are able to find food and enjoy themselves by exercising an acute sense of hearing and feeling. Like a blind man who gropes his way along the street by means of a stick, as well as his keen sense of hearing, these animals apparently have no difficulty in finding their way, and also, what is more strange, catching for their prey animals possessed of sight. Here, we are called on to admire the wonderful adaptations of Nature. All living creatures have an organisation suitable to the position in which they are respectively placed, and adapted for finding their means of livelihood. Daylight, the gloom of twilight, total darkness—each has its appropriate animal life. Where there is no light, there is of course no need for eyes, and accordingly there are animals without eyes, adapted for living in those dark caverns into the recesses of which the sunlight never penetrates. Of animals destined to live in the dark, there are various genera and species, the more remarkable being certain insects and fishes.

Perhaps the most curious of all cave-animals are the blind fishes, which were first observed in that chief wonder of the American continent, the Mammoth Cave of Kentucky. This, the largest known cavern in the world, is in Edmonson county, and near Green River. It consists of a series of caverns, connected by long narrow galleries, which have

been explored to a distance of ten or twelve miles. These caverns, with their beautiful stalactite formations—from small pendicles to massive columns elaborately fluted and corniced, their delicate translucent curtains, elegant pendants, lofty pedestals, rosettes, wreaths, and other lovely stone-flowers, have been often described, since the Mammoth Cave was first discovered by the whites in 1801. A lively and altogether interesting description of it, under the title, *A Visit to the Mammoth Cave of Kentucky*, was published by the late John Wilson, the Scottish Vocalist, in 1849, the year of his sudden and early death. Speaking of a river which flows within the cavern, and has to be crossed in a boat, he says: 'Echo River is the great one we have to cross. . . . In this river are the eyeless fish. There are two kinds of them, neither having the least resemblance of a place for an eye, for, of course, they have no need of eyes.' He says further on: 'As we were sailing up the river on our way home, Alfred, the guide, caught two of the eyeless fish. They are small, about a finger's length, one of them like a minnow, and the other something like a shrimp. There is not the slightest appearance of eyes about them.' John Wilson in these two sentences, the only allusions he makes to the blind fish, communicates almost all the information which had then been acquired.

The industry of American naturalists has in the meantime added considerably to the stock of knowledge regarding them. At a meeting of the Essex Institute, in Salem, Massachusetts, on November 25, 1874, living specimens of the two species of blind fishes which have been found in the cave were exhibited by Professor Putnam. Along with them he shewed a fish never before caught in the waters of the Mammoth Cave. This is the *Chologaster*, which Agassiz had described as he found it in the ditches of the rice-fields in South Carolina. It differs from the other two species in being provided with eyes. The specimen exhibited by Professor Putnam was nearly five inches in length, of a delicate brownish tint, and shewed dark and well-developed eyes. Five specimens had been secured by the net, but with great difficulty, so shy and quick of movement is this singular inhabitant of the dark waters of the cave. The habits of the *Chologaster* are in marked contrast to those of the blind fishes. It lives at the bottom of the stream, darting with the utmost rapidity, and swimming rapidly by very quick lateral motions of its whole body. It seldom comes near the surface, unless when disturbed. The blind fishes, on the contrary, swim slowly about, or remain at rest, near the surface. By the aid of torch-light they are readily seen, and are captured by a careful and quick movement of the scoop-net. The movement has to be very careful; for if, by means of peculiar organs of feeling with which they are liberally supplied, they feel the least disturbance in the water, they move off with a quick dart, and again swim slowly about. Occasionally, but not often, they drop to the bottom for a short time. Dr. Tellekamp says: 'It is found solitary, and is very difficult to be caught, since it requires the greatest caution to bring the net beneath them without

driving them away. At the slightest motion of the water they dart off a certain distance, and immediately stop. Then is the time to follow them rapidly with a net, and bring them as quickly out of the water.' Professor Cope says: 'If these Amblyopses be not alarmed, they come to the surface to feed, and swim in full sight like aquatic ghosts. When on the surface, they are easily taken by the hand or net, if perfect silence be preserved, for they are unconscious of the presence of an enemy, except by the sense of hearing. This sense is, however, very acute, for at any noise they turn suddenly downwards, and hide beneath stones, &c. at the bottom. They must take much of their food near the surface, as the life of the depths is very sparse. This habit is rendered easy by the structure of the fish, for the mouth is directed upwards, and the head is very flat above, thus allowing the mouth to be at the surface.'

The fact that these blind fishes succeed in catching for their prey the *Chologaster*, which as we have already mentioned is endowed with sight and very rapid in its movements, shews how well developed the sense of touch is. The blind fish must be very active in the pursuit. It is probably guided by the movements made by its prey, the water so sensibly influencing its delicate organs of feeling as to enable it to follow rapidly; while the fish pursued, not having the sense of touch so fully developed, is constantly encountering obstacles in the dark. The blind fish brings forth its young alive. This fact was proved by the statement made by Mr. Thomson before the Belfast (America) Natural History Society, to the effect that one of them from the cave, four and a half inches long, was put in water as soon as it was captured, and gave birth there to nearly twenty young ones, which swam about for some time, but soon died. These, with the exception of one or two, were preserved, and were each four lines in length. As to the size to which they grow, Professor Putnam tells us that the longest specimens of the *Amblyopsis* he has seen were from four to four and a half inches. Dr. Günther mentions in his *Catalogue of Fishes* a specimen in the British Museum which measures five inches. The largest which has been reported as taken of late years is said to have been captured during the summer of 1871, and sold for ten dollars to a person who had the precious morsel cooked for his supper. The smallest specimen Putnam had seen when he gave his lecture at the Essex Institute measured one and nine-tenths of an inch in length.

It is still a matter of doubt whether these blind fishes are from a species radically destitute of eyes, or have lost their eyes by disuse. The probability is that they are descendants of fishes with eyes, and by living a long course of years in darkness, their eyes have disappeared; in other words, that they are the victims of circumstances. What fortifies this latter view of the matter is, that these blind fishes possess marks indicative of eyes when in a former condition. It is said that these abortive eyes can be detected as black spots under the skin. Owen describes the eye as 'a minute tegumentary follicle, coated by a dark pigment, which receives the end of a special cerebral nerve.' Putnam says: 'Whatever view be taken with regard to the development of the eye in the blind fish, the anatomical characters which have been discovered and enumerated, shew that though

quite imperfect as we see them in the adult, it is constructed after the type of the eyes of the vertebrates.' It certainly is not adapted to the formation of images, since the common integument and the areolar tissue between it and the surface would prevent the transmission of light to it, except in a diffused condition. No pupil, nor anything analogous to an iris, was detected, unless we regard as representing the latter the increased number of pigment cells at the anterior part of the lobe.

The *Chologaster* has been called the mud-fish, and from the statement that it is of a dark colour, taken along with a drawing of the animal, we learn that the position of the dorsal fin is the same as that of the fish commonly called the mud-fish in the fresh-waters of the Middle, Western, and Southern states—a circumstance which indicates, perhaps, that it belongs to the genus *Melanura*. The mud-fish is so called from a habit it has of burying itself in the mud to the depth of from two to four inches, and remaining so buried during a time of drought. This habit may have tended to fit it for a subterranean life. Its colour has been remarked on by several American naturalists in relation to the theory of the adaptability of the colour of an animal to its surroundings. It is so nearly the exact colour of the dark sand at the bottom of the river in the Mammoth Cave, that it is difficult to distinguish the fish when it lies at rest. This, however, can hardly be said to add to its security, for, as utter darkness prevails, the fish would be equally safe from its enemy, if it displayed on its body all the colours of the rainbow. Besides, its principal enemy is the blind fish. If the chief reason for the adaptation of colour to surroundings is protection against attack, it might be remarked that the *Chologaster* may have had enemies, now extinct, against whom its colour was a safeguard, or it may have other enemies besides the blind fish, of which we know nothing.

The great speculation regarding these denizens of the cave has been, how did they get there at all? Professor Putnam, a remarkably cautious reasoner, suggests that the sea at one time extended over the limestone region in which the great cave is situated. He says: 'Some forms of life are found in these subterranean streams which at present seem to indicate a marine origin; and brackish-water animals of certain characters, once inclosed in the cave, would be very likely to survive under the peculiar conditions in which they were placed, as we know to have been the case under other somewhat similar circumstances. That many, or, with two or three exceptions, nearly all the thirty or forty species of vertebrates, articulates, molluscs, and still lower forms, including a few plants, now discovered in the caves of Kentucky, are of comparatively late introduction, is probable from the fact that they are so closely allied to forms living in the vicinity of the caves; but that the blind fishes, the *Chologaster*, and a few of the lower class of articulates, as the Lernæan parasite on the blind fish, may have been inhabitants of the subterranean stream for a much longer time, is worthy of consideration on the following grounds. Firstly, the blind-fish family has no immediate allies existing in the interior waters; only another species of the family, in addition to those found in the Mammoth Cave, being known, and at present existing in

the rice-ditches of South Carolina. Secondly, the Lernæan parasite is much more common on marine fishes than on strictly river species; and is more decidedly a marine than a fresh-water form. These facts may be taken as at least indicating the probability of the early origin of some part of the great cave system of the Ohio valley; and while there may be nothing in the present structure of the caves to indicate their having been formed in part while in contact with salt-water, the erosion of the limestone, and the modification of the early chambers by later action, should be carefully thought out before it can be denied that the caves were not, in some slight part, for a time supplied with marine life.' Professor Putnam goes on to assert, with what seems good reason on his side, that until a specimen of the *Chologaster*, or some other member of the family, has been obtained in the external waters of the Ohio valley, we cannot regard the family to which the blind fishes belong, as having been originally distributed in that valley, and afterwards becoming exterminated in the rivers, and only existing in two such widely different localities as the coast of South Carolina, and the subterranean streams of the South-western States. Marine forms of life are found in fresh-water rivers. There was exhibited at that meeting of the Essex Institute a specimen of a shrimp which had been taken in the Green River near one of the outlets of the Mammoth Cave. In Florida, fishes, once marine, are now confined to fresh-water lakes of comparatively recent formation. The announcement of the *Gobiosoma* having been found in the Ohio River, is another instance of a marine fish living in fresh waters.

Blind fishes are supposed to exist in all subterranean rivers that flow through the great limestone region underlying the carboniferous rocks in the central portions of the United States. Professor Cope obtained specimens from the Wyandotte Cave, Kansas, and from wells in the vicinity. In the Museum of Comparative Zoology at Cambridge (America), there is a specimen which agrees with those animals found on the northern side of the Ohio, as well as on its southern side, in the rivers of the Mammoth Cave. In a cave situated several miles down the Green River from the Mammoth Cave, and on the opposite bank, a number of specimens of the *Typhlichthys* and several blind crayfish have been collected. In this cave, called Blind-Fish Cave, blind crayfishes have been found not far from its entrance; and at times they have been taken quite out in the daylight, while yet they are identical in every way with those of the Mammoth and other caves where utter darkness prevails. Nay, further, Poey, the distinguished Cuban naturalist, has given an account of blind fishes found in Cuba, in wells and caves, at a depth of between twenty and thirty metres below ground. They are well known to the negroes, who eat them. In fact, all the recent indications show that there is a very great deal still to be learnt about blind fishes and cave-life generally. Zealous exploration of the caves, and minute and exact records of the discoveries made in them, are profitable occupations to observant naturalists. The caves of the West Indian Islands, those of Brazil, of the East Indies, and of Africa, are wide openings to vast stores of curious knowledge. As to the Mammoth Cave, Professor Putnam suggests that, for fresh and thoroughly extensive explorations,

a Commission should be appointed, acting under the American government or state authority, in order that the most ample facilities may be afforded by the parties who own it.

AN ELECTION STORY.

IN TWO CHAPTERS. CHAP. I.

WHEN it was announced, by numberless posters and smaller bills, to the worthy electors of the ancient borough of Westdown, that Sir Harry Waring, Bart., had consented to become their candidate in the forthcoming election, every political wisacre of the locality declared his return was 'as good as certain.' For he was an unexceptionable candidate, and had—so every one asserted—made up his mind to leave no stone unturned to obtain his seat; and if he had not quite determined to die in the attempt, at least he was quite resolved to 'bleed' freely during the campaign; then he was of good presence, tall, handsome, and well-made, with a clear mellow voice, just fitted to enunciate new arguments or set off old ones to the best advantage. There was nothing utopian or immovable about his programme; his views were firm, but modifiable; his political opinions were so uncompromising, that it took an energetic deputation to alter them; in short, he knew as well how to balance himself between two stools, as any 'Liberal Conservative' or 'Moderate Liberal' in the present House of Commons. Every charity in Westdown would gain by the possession of such a member, should he be returned; and last, but not least, Sir Harry had a handsome wife; a lady whose family was known by the electors to be 'very high,' she being the second daughter of the late Earl Affington of Kingsdene; and when an earl's daughter with undeniable beauty sets to work to charm the suffrages out of electors, the chances are that her husband will head the poll, unless, indeed, the wife of the opposing candidate be still handsomer—and the daughter of a marquis.

Lady Waring was above the middle height; her form was perfect, and she resembled in feature the great Mrs Siddons—not as that lady appeared in a tragic part, but as she might have looked in genteel comedy—her nose and mouth being finely chiselled, and her eyes large, lustrous, and brown. Her manner was charming in its stately grace; not that she was simply a beautiful statue; on the contrary, there was as much fire, force, and tenderness in her face as would serve for five or six ordinary ladies of this impassive nineteenth century. Sir Harry was a fine man, standing some six feet in his boots; he had a clear, healthy complexion, keen gray eyes, and an 'aristocratic' nose; his face was almost whiskerless, and he resembled one of the bland heroes of mild romance, as depicted in old engravings, except that his figure was not rendered preternaturally slender by the wearing of stays, and that his brown curly hair was not powdered.

Sir Harry and Lady Waring had been married one year at the time my story opens, and the election campaign had commenced. As both were handsome, those who agree with the proverb, 'Like clings to like,' will not be surprised to hear that theirs was a 'love-match' on both sides; but it is probable that the Affington family, and the select few who were privileged to call themselves its friends, were never more astonished than

when the engagement was made public; for Agnes had long been destined by her mother and other near relatives, to marry a very ancient millionaire, the Marquis of Cawt; and that peer had paid her all the attention supposed to be necessary from a titled Cressus to win a young lady's hand in these unchivalric days. And it is probable that Lady Agnes would have become Marchioness of Cawt, had she not met Sir Harry at a county ball, where something very like love at first sight was experienced by both the young people. Still, the impression might have worn off, had not Sir Harry gone on a visit to Hartmoor (the estate lying next to Kingsdene); for there, between pleasant strolls in mossy lanes, and croquet-parties on the shady lawn near the old gray weather-beaten house, and boating on the lake, and idling about the grounds, Sir Harry was fairly enslaved, and placed his hand and fortune at her disposal. To Lady Affington's unfeigned vexation, Agnes did not refuse them, but openly 'declared her love' and her resolution to have her own way—and the baronet.

It was so astounding to her mother, that Agnes, who had always been rather ambitious, and who was so well calculated to shine in society, should prefer a mere baronet to such an unexceptionable *parti* as Lord Cawt. And Lady Affington's disappointment is not to be wondered at, for Agnes was the first daughter of the house for many generations who had married for anything but a good establishment, or evinced any but the calmest and coolest attachment towards her husband. But Agnes was a degenerate Affington, possessing a warm heart and a very strong will; and she could not be content, as so many of her ancestors had been, with a mere lukewarm attachment; and so she was fully determined, in spite of all opposition, to marry the man she loved, or no other. Thus in due time Sir Harry and she were married, amid the half-hearted congratulations of her kindred and friends; and during the time they spent in Scotland, and afterwards at Waring Park, they were supremely happy.

Sir Harry knew that his wife was considered to have 'a will,' nay, even 'a temper' (indeed, if she had not possessed the former, it is probable she would never have become Lady Waring, from the objections already stated to the marriage); for even in the most polite and well-bred family, where peculiarities are ignored, it is impossible that any one in daily contact with its members should remain totally unaware of any specialities of disposition that exist. But then the Baronet knew that he too had 'a will,' and perhaps a 'temper' also; and as he always would be kind but firm—very firm towards her, and as he knew that he was beloved, it is not surprising that he felt satisfied she would never be self-willed or obstinate with him.

For some months all went smoothly. If Agnes Affington had been at times hasty and exacting, Agnes Waring was more deferential and anxious to please than any ordinary meek woman ever was, and fulfilled all her wifely duties in an admirable manner. Unfortunately, however, love which can work wonders, cannot prevent two people bound to each other for life, who possess only a conventional amount of self-control, from being anything but comfortable in the end. Before long, Agnes Waring took umbrage at trifles just as readily as Agnes Affington had done; and Sir

Harry was as impatient and easily provoked as he had been before he was subdued for a time by his wife's surpassing beauty. Then Lady Waring would subside into silent hauteur, and Sir Harry was tempted to try the serenity of her contempt, and in some instances succeeded; and then passionate scenes ensued between them, which would have surprised those who were aware that they had been once deeply attached to one another.

It must not, however, be supposed that Sir Harry and Lady Waring invariably disagreed, for they had many pleasant cases amidst the dreary desert of ill-temper; only, as time went on, these were less often met with, while the sand-storms were more frequent.

The day Sir Harry and his wife arrived at Westdown was one of these cases; the former had neither frowned nor sneered, and the latter had looked and talked her very best—which was no mean best. They had been greeted with uproarious enthusiasm by the crowd; a small brass band had brayed patriotic airs, and later, several tradesmen had exhibited designs in gas in their honour, and it had been a triumphant *entrée* indeed.

As the colour that denotes that the wearer is Liberal or Conservative in one county or borough, is sometimes worn by the opposite party in another, it may be mentioned, without at the same time divulging Sir Harry's political principles, that the 'Waring colour' was yellow.

The amount of labour he and Lady Waring got through in the next fortnight it is almost impossible to describe. He did his duty manfully; hawled platitudes at ward meetings as long as his voice would last; made vigorous attempts to conciliate every class of voter by an active personal canvass, and enunciated misty arguments, enlivened by aged 'Joe Millers,' at the large public meetings. Lady Waring also played her part well, receiving provincial magnates—so given to prosing graciously, shaking hands with some scores of her husband's supporters; and there is little doubt that her grace and beauty gained for Sir Harry more votes than his eloquence could ever have done.

The opposing candidate was the Honourable George Wynne, a middle-aged, ordinary-looking man, much given to the recounting of unintelligible statistics. Such a man would not have been a very formidable antagonist to the handsome young baronet, had he not been aided by the charming young wife he had recently married, and who had come to Westdown to assist him to the utmost of her powers. Every day, the 'winning Mrs Wynne,' as the 'blue' newspaper of the town called her—her husband belonging to that party—and her beautiful rival drove through the quaint streets of Westdown. Lady Waring, attired in a faultlessly fitting buff costume, and wearing some bewitching hat or bonnet which showed her beauty to even greater advantage, guided her spirited bay ponies with a firm accustomed hand, and bowed right and left with almost imperial grace; and Mrs Wynne, too young and heedless to manage her pretty gray ponies, was driven by a smart page. She was very young, with an innocent, unsophisticated look in her fresh, smiling face; soft, brown-gray eyes, and golden hair, that escaped from its fashionable trammels, and floated in airy locks around her forehead, and mingled with the dark-blue ribbons that she wore; and sometimes, when a muddy politician

hissed or hooted as she passed, her face would cloud for a moment, as it might have done not long before at some unmerited rebuke in the schoolroom. But her youth and her pretty sensitive face usually silenced the adverse rabble. Lady Waring, on the contrary, if she were received with an outburst of enthusiastic cheering, or in silence, or with 'marks of disapprobation,' was uniformly calm and impassive, always ready to bow with incomparable grace and *sang-froid* when the occasion demanded, but not otherwise; whilst ardent little Mrs Wynne scattered smiles broadcast among the crowd, and shewed by every gesture how she longed for her husband to be victorious. Westdown could at first hardly decide which beauty it preferred, but ultimately, though many admired the 'English' loveliness of Mrs Wynne, the majority of the people found Lady Waring's fine features and graceful dignity most to be admired. 'It was so aristocratic.'

Sir Harry was decidedly the popular candidate. His meetings were large and encouraging; while Mr Wynne had been silenced in one ward and pelted in another. Altogether, there was every prospect that the former would be victorious. Still his success was by no means certain. There were a number of 'doubtful' voters who might yet turn the scale in Mr Wynne's favour; and knowing this, Sir Harry was nervously anxious to gain votes, and irritable and dissatisfied when he imagined that from some cause or other, one had been lost to him.

Two days before the election, the canvassing being over, a large final meeting of Sir Harry's supporters was to be held at the town-hall, at which Lady Waring and a great number of ladies with buff sympathies were to be present as usual. All had gone tolerably well between Sir Harry and his wife until the night before, when he had declared that she had not been sufficiently affable to some of the more apathetic members of the party at a private meeting held at the hotel; and reproached her with having lost him much 'interest,' if not several votes, in consequence. It must be owned that this was unjust, for Lady Waring had been working hard for a fortnight, doing all in her power to insure his return; and during the whole time he had never once thanked her, or paid her the simplest compliment; and whilst others were so ready to utter pleasant little flatteries on her appearance and her aptitude for election warfare, he treated both as mere matters of course, quite undeserving of notice or comment. She had answered his reproaches at first coldly and contemptuously, not deigning to defend herself, or appease his rising irritation with any wisely hypocrites; but when he had replied harshly, her passion had risen, and after uttering many bitter truths and exaggerations, she had retired for the night in a very unenviable state of mind, leaving Sir Harry in a towering rage to brood over her words at his leisure.

They saw but little of each other during the forenoon of the day of the meeting, Sir Harry being busied with his agent and committee, and Lady Waring driving out as usual. At luncheon, except for an occasional monosyllable, silence reigned between them, shewing that the quarrel of the previous evening was forgotten by neither. In the afternoon, Sir Harry returned thoroughly fagged, to rest before dining, so as to be the better

able to deliver his final speech in the evening. Lady Waring was in the room when he entered, and was still chafing at the bitter words, not only of the night before but of many former occasions, which now rankled in her mind. Everything, however, might have subsided quietly for the time, had not one of the committee entered the room to convey some unimportant election intelligence in an important manner. After a short, genial chat with Sir Harry, he tried to gain Lady Waring's attention by addressing to her a few rapid remarks; but he was speedily reduced to silence by the hauteur of her look and tone, and soon took an awkward leave of Sir Harry, who sought to cover the chilliness of his wife's farewell recognition, by warmly shaking him by the hand as he left the room. Sir Harry was greatly provoked at her manner—assumed, he said, to annoy him—and he determined to alter the state of things once for all.

'Agnes,' he said, 'your manner to that man was simply intolerable—one of our foremost men too. You shew very plainly that—you care nothing for my success—nothing for me—but that, I am aware, has been the case for some time. Any other wife would at least have the decency to—to hide her indifference when she knew that most important results were to be gained for her husband by—by at least a show of amiability. One would think that, knowing the *prestige* of the thing, and how one's social position is enhanced by it, you—you would help to insure my success for your own sake, if for nothing else. But no! it pleases you to be haughty and disdainful; and you are supercilious enough to—in fact, to lose me every vote in the place.'

"The prestige of the thing"—"the social position," repeated Lady Waring, with cold scorn in her tone. 'In the numerous effusions of yours that I have seen since I came to this place, I believe you have given another reason for your anxiety to enter parliament. Let me see—I think it was "necessary to the well-being of the working man," the "advancement of trade," and "the welfare of our glorious constitution." And Lady Waring quoted various other stock phrases from her husband's speeches, delivering them with a disdainful emphasis intensely galling to him.

There can be nothing more irritating to a man when he has been persuading himself for some weeks that his motives are pure and disinterested, than for a friend or relative to lay bare the hidden causes from which his actions spring, and shew him how flimsy and worthless are his high-flown sentiments. But when his wife, who should be blind to his failings, taunts him with his evasions and inconsistencies—as Lady Waring did in this instance with unsparing tongue—the probabilities are that he will have for her, as Sir Harry began to have for his wife, something almost amounting to fervent hatred.

He was so thoroughly enraged, that when she ceased speaking it was some moments before he could answer; but at last he said: 'At anyrate, Agnes, if you have lost all sense of your duty as a wife, and—and care for nothing but satisfying your own caprices, I—I am determined you shall do what I wish, nevertheless. You shall do all in your power to please and conciliate the people. You delight in setting my wishes at naught; but you must learn that I am to be obeyed—I

am your husband, remember, and I—I will be your master!'

Lady Waring rose and looked at him with heightened colour and a defiant gleam in her lustrous brown eyes.

'It was a pity,' she said slowly, 'as you evidently wanted a slave for a wife, that you did not marry some pretty nonentity of a school-girl, who would have obeyed her "master's" commands without question, and received all his arrogance and ingratitude with meek thankfulness. Such a rôle does not suit me.'

'It was a pity,' he answered savagely, with a sullen look; 'but as it cannot be remedied, I must put up with it, however much I regret it. And you will have to accustom yourself to the rôle, for you—you shall obey me, though you hate me in your heart. You have thwarted me for a long time. But I will put a stop to it once for all. You shall find that when you lost your amiability, you—you lost your power. My will shall govern yours for the future. Now, you will go to-night, and'—

'I will not go!' she cried, turning from him, and stepping towards the door. 'You cannot force me. Only fancy the suave, courteous Sir Harry laying hands on his wife! I did what I could to further your cause, and you tell me I have done worse than nothing. Very well! I will serve you no more. And you repent marrying me. I can leave you—at once, if you choose; it matters nothing to me. But I stir not one step to the meeting to-night;' and she opened the door and would have left him, but that he strode towards her white with passion, and held her back.

'You shall!' he said in a hoarse voice, too overpowered by rage to speak distinctly. His face was disfigured by passion as he looked at her, as she fronted him steadily and defiantly.

'If I could do anything to make you lose this election, I would!' she uttered. 'I will not be forced to stay here—let me go!' and she attempted to free herself from his grasp; but he, mindful in the midst of all, of passers-by, attempted to drag her back into the room, and seized her with such force that his furious hold bruised her shapely white arm.

'Coward!' she cried, and her bitter contempt was not good to see at that moment—'coward! I will not go; you cannot—you dare not force me!'

PHYSIOGNOMY OF HOUSES.

ANYBODY who has travelled outside the limits of his own shire knows how houses in different parts of the country shew distinct recognisable types. If a house out of the south-eastern counties could be dropped anywhere in my region, I believe I should be able to detect its provinciality. In some manufacturing districts, the dwellings are of a tall, slim, consumptive build, suggesting that they are run up too quickly, suffering for it ever afterwards; in some other neighbourhoods, they are sturdy, broad-set, looking robustly at you, evidently twice as able to face the world. In one county, houses stand in the hard, chill grayness of stone, with shallow windows, which, in the daytime, never shew more than three inches of white blind: elsewhere, they jollily glow in all the colours of brick, setting off their shining casements with profusion

of lace and muslin. Some districts habitually wear their roofs pitched half as high again as others; and the roofs themselves may either redden in tiles, or gleam bluely in slates, or modestly hide in sober thatch.

It is the houses more than the people that give the general aspect to a locality. The buildings are the 'larger inhabitants,' and they impress you more. I know a district in the north of England where the houses are wretched-looking, deformed, repulsive; they might be blind, lame, maimed, diseased buildings mustered from all other parts. Travellers by railway, seeing the place for the first time, I believe do not feel quite at ease till they are several stations away. On the other hand, there is a certain region in the west of England where every dwelling has so meek an air, that you seem to be on terms of acquaintance with anybody you happen to see standing at a door. But these general typical distinctions are not of the highest importance; the serious point is, that, wherever you may live, you are on good terms with some of the houses you have to face daily, while with others you are on ill terms. Certain dwellings you like at first sight, others you never get a friendly feeling for, if they do their very best to gain your good opinion, laboriously preserving an unblemished character year after year. It is of little use attempting to explain the mystery. If you watch a house building, you never quite know how it will turn out in this respect till the very last minute. So long as the scaffold-poles are all up, the premises have no more character than a human hobbledehoy. But once let the roof be closed in, the last brick be put upon the chimney, and the building fairly open its eyes—that is, shew its windows glazed—and it becomes an individuality straightway.

I should be sorry to say that there are not houses which, by trying very hard, will in course of time, if you are obliged to see much of them, force you to abate a little of your first ill opinion of them. I have seen a few houses successfully reform. They have put up clean blinds, repainted their woodwork and ironwork, and have made their decency obtrusive even. But it is very difficult; to succeed they find nearly as hard a task as do human beings in the same circumstances. There is great unfairness. In different places, I know several handsome, reckless, ill-principled houses which have repeatedly had deaths from fever in them; occasionally they break people's limbs by throwing them down steps and stairs; children have been drowned in wells upon the premises; they regularly give old people the rheumatics. Yet folks cannot shake off a sneaking liking for them. There are other decent, hard-striving, careful, quiet premises, which, if they so much as lose an infant in teething or by measles, have everybody in a hubbub against them instantly. It is said to be all the fault of the houses.

Some houses I only know in a collective kind of way; a row of them together, or a square, a cres-

cent, a terrace: just as you only know some people in the rack, so to speak, as being members of the same family, or belonging to the same 'set,' no one of them affecting you particularly. I am acquainted with a row which has an especially well-to-do kind of air. The houses put forward such rotund bay-windows, keep the front railings, the doors and windows, in such unnecessary freshness of paint, shew glimpses of such a wealth of children, have such an army of servants, and now and then get up such a brisk bustle of carriages, that it is nearly like a small sum of found money in your pocket to walk past and have a good look at them. They are among houses what aldermen are among men—completely prosperous. I would not miss that row of dwellings for a trifle: if they were pulled down, the town would feel a gloom; a great many persons in the habit of passing the locality would be made worse-tempered without knowing why. In every small town, and in certain quarters of the larger ones, there is just such a row, or quadrant, or square, which gives a special character to all around. Sometimes, it is true, a 'big house' coming into a neighbourhood will morally ruin it; what was before a modest district, will begin to put on airs, and grow conceited.

But houses may be known in the collective way for ill as well as for good. I know a square of as ill-conditioned, cantankerous mansions as can be found anywhere. They set their curtains at one another; they try to push their dirt each in front of the next; if one house slams its door, another instantly bangs its door; they flaunt faded green mignonette boxes from the first floor window-sills under one another's noses; they try to puff smoke at each other from their chimneys. First one house, then another, sets the people in it to quarrel with those in the next; occasionally others join in, until there is a general uproar. I pity the inhabitants. Evidently, they are made tools of by the premises; the blotch-fronted house at the first corner, and the second one opposite, with a piece broken out of the upper window-sill, being, as I suspect, mainly at the bottom of it all. Even this is not the worst case. In another part of the town is a short street of houses so deformed, so slouching, so desperate-looking, that I would go a mile round to avoid a glimpse of them. They seem ready for anything that is bad; as if, when dark comes, they might shift their ground, and go in search of villainy, if it did not come to them. I do not know that it would much surprise me to come upon them at midnight slinking along on their way to some other foul, bad quarter of the town. But when daylight comes, they are always back in their place. Ugh!

I gladly turn to where, in a by-corner of a nice quiet thoroughfare, stands a house which is the drollest, most diverting, squat, two-storied, five-windowed, low-doorwayed, comical brick-and-mortar creature anybody ever had the luck to discover. Its temper is very uncertain. Sometimes it takes not the slightest notice of you. You may pass it, you may re-pass it, and there is not a sign that it sees you; you cannot detect a twinkle in the corner of a single pane; not a shadow stirs from eaves to basement. Go by it the very next day, and so soon as it gets its first wink of you, while you yet are yards away, it flashes into mirth in every window; a quiver of broad grimaces runs

up from one story to the other, till it seems to give the very roof a side-cock, slightly nodding towards you. Not far from this queer little dwelling are two tall, stately houses, so utterly respectable, so perfectly genteel, that I feel a sense of restraint in alluding to them here. You are certain that neither of them has done the slightest improper thing in its life. You go and try to catch them unawares; it is of no use. They never nubend, even to the extent of wearing a blind the least bit crooked. You instinctively straighten your back as you approach them, carrying your stick or umbrella properly, and walk past at your very best, feeling that they are critical. But even these are better than another house I know elsewhere, which frowns at you with its eaves, threatens you with its pot-laden chimneys; every window scowls at you from the corner of pitch-black panes, no matter how brightly the sun is shining. You feel sure that it keeps a bad-tempered dog at the back, to bite you if you ventured within its territories.

To describe in detail all sorts of houses would be impossible. Some of them would have to be spoken of as uncertain in temperament. There are weak-minded houses as well as men; you do not know what they will be like on your next seeing them. One time, they look steady and respectable; at the next inspection, they have quite gone to the bad, are suddenly and mysteriously grown reckless, wretched. They have given up cleaning their doorsteps; they no longer take any pride in their knobs or knockers; perhaps, they wrinkle and soil their blinds; it may be, they grime their panes with dust. A number of houses which, I believe, are really decent and well-behaved, having nothing in particular upon their consciences, suffer much in appearances, simply from an odd nervousness of manner they have. They huddle away their outbuildings, just as if they had stolen them, and were afraid of their being recognised if they were seen. Then, some old houses can commit startling acts of folly. A house that was for years a great favourite with me, suddenly turned its back upon its long-earned reputation in a most shameful way. It used to be a quiet, sedate dwelling, with only elderly people to be seen in and about it; you would have felt sure that the cry of a new-come baby in any room within it would have made it start till it shivered its very tiles off. But passing it one day after a long interval, I was shocked; it had a whole family of young children sprawling about the doorstep, every one of them plainly enough its own.

I have met with a worse case even than this. A small dwelling which year after year was perfectly inoffensive, if not in any way gratifying, all at once stuccoed its front, thrust out two inflated bay-windows, stuck on at the gable a pretentious conservatory, with a stupendous gilt weather-cock upon the roof, and put up a pair of green side-gables half as big as itself—a cooped-up, tawdry-pinnacled coach-house looking at you over them. It now insults every other house within sight in the street. Its last freak has been to perch a great white cockatoo in front, to scream all day long. In fact, its self-conceit is making it an offence to all the neighbourhood.

But I will not quit the subject in this unthankful way. Let me speak of a villa I know in one of the suburbs; the daintiest nest of elegant com-

fort and sweet health imaginable. A cluster of tall shapely elm-trees at its back scatter shadows, now lightly, now thickly, upon its peaked roofs. Its garden and grounds, with their close-shaven lawns and clean-gravelled paths, are of just the right dimensions; matching exactly the broad sunny southern gable, the honeysuckled porch, the mullioned rose-trained windows. White-roofed greenhouses and a picturesque grotto partially shew among the laurels, the hollies, the dwarf firs. In the right months, beds of rhododendrons heap their blossoms on each side of the short curving drive; or geraniums burn in different hues nearer to the ground, with lines and patterns of other flowers here and there. Always a ripple from a tiny brook is tinkling faintly somewhere within the bounds, half-betraying its secret windings towards a small triangle of white shining pond, lying a little to the left in front. This house keeps a baby to roll laughing and prattling at times about the centre grass-plot; it also has a silver-haired grandmother to sit, book in hand, occasionally on a seat under a drooping beech close by. In fact it spares nothing; it is perfect. Every one who passes is put into good-humour by this dwelling; I myself make little private pilgrimages, just to be gladdened by the sight of it.

I have referred chiefly to the outsides of houses; nearly similar remarks might be made as to their interiors. Some houses are sad deceivers. Seen from the outside they are bright and gay, but the moment you pass the threshold their hypocrisy is detected. The rooms chill you, the passages blind you. I know a house with a whole family of unmarried daughters—unmarried they will remain so long as their parents mistakenly live in it. There is not a snug bit of shelter in which a sheep-faced young fellow might safely make love, in the whole premises. The rooms are somehow all connected, doors opening in and out everywhere; and in the least-used apartment, where wooing would have mainly to take place, a staring mirror over the mantel is so whitely, so blankly lighted up by a queer corner window, that any decent young man thinking of a proposal would be put out of countenance by it instantly.

Rooms differ very much in the feelings they give. I have been in two or three so hard and stern, that only give me my back to the window, and I think in them I could calmly receive my creditors, and explain to them that I could not pay. In other soft languishing rooms, the first word of such a statement would crush you. I know apartments where nobody can be good-tempered, no matter how hard he may try; turn combative men in, and they straightway begin to argue; introduce some women, and, under the sheer influence of the place, they start the talk with scandal. There are other rooms in which nobody can be long without beginning to joke; some people are witty there, and nowhere else. And I know at least one room so well lighted, so frank, so clear, so mildly stern, that in it, it would be impossible to refuse a reasonably asked favour, even *before* dinner.

But in fairness it ought to be said that some of the houses we have been blaming might urge something for themselves. Numbers of them might say that they have never had a fair chance either to gain or to keep a reputation. They have had too

big a family fastened upon their backs from the very start, or else they have never had a clean tidy tenant put into them. Some houses are much to be pitied.

OUR FEATHERED NEIGHBOURS.

THE CUCKOO.

Most people are pleased when they hear the note of the Cuckoo for the first time in the season of spring. We welcome it as the harbinger of fair weather, green fields, flowery hedgerows, and verdant woods.

Notwithstanding the familiarity with which the cuckoo's dulcet notes are recognised, seeing that it prevails throughout our own islands and the continent of Europe, few persons, comparatively speaking, are acquainted with the habits of this annual visitor to our land. Visitor only during the early summer months it is now generally considered to be, although formerly it was gravely contended, that, instead of migrating, it hibernated within our coasts, secreting itself in stacks, or under litter in barns. There may have been instances of this, but they are exceptional. The cuckoo is a migratory bird, and returns to its accustomed haunts with unerring regularity. The old adage says :

Let the sun be never so strong,
The cuckoo won't come till March has gone.

It should be borne in mind that in matters pertaining to folk-lore the 'old style' is generally referred to; so that, according to our ancestors' reckoning, the bird may be expected by us about the 12th of April, which is tolerably near the mark. In northern districts of Great Britain it makes its appearance generally about the end of April or beginning of May. The pleasant note of the cuckoo resounding through the groves has suggested many poetical effusions. Apparently without knowledge of its character, poets make it the theme of compliment and admiration. Alluding to its note, and annual migration of the cuckoo to a warmer climate, Michael Bruce observes in his charming ode—

Thou hast no sorrow in thy song,
No winter in thy year.

He might have extended the compliment to the effect that no bird is so fortunate in getting rid of the trouble of bringing up its young.

Like some dastardly parents who leave the rearing of their children to others, the cuckoo has the impudence to leave other birds to sit on its eggs and bring the young to maturity. It is a clever device, and the wonder is how the poor foster-parents can be cheated into this act of hospitality. The thing is managed very adroitly. The female cuckoo lays her egg on the ground; then taking it in her beak, she watches an opportunity to pop it into the nest of some small bird, such as a hedge-sparrow, robin, wren, or titlark; these unsuspecting little animals having no more notion of the trick that has been performed than a hen has when it sits assiduously hatching the eggs of a duck. The rascality of the parent cuckoo is matched by the young intruder. As soon as it is able to look around, it begins to contrive ways and means of ejecting from the nest the young of its foster-mother, in order that it may enjoy all

the food that is brought to the nest. In succession, one after the other, it ejects the whole brood, which tumbling down outside, are left to perish. Occasionally, two young cuckoos have been discovered in the same nest, but in that case they have no more pity on each other than on the legitimate occupants. A battle takes place as soon as the latter are all disposed of, and, of course, the weaker of the two will eventually share the fate of the others. The cuckoo never lays two eggs in the same nest; when more than one egg is found, a second cuckoo has visited that nest. In 1853 Dr Baldamus of Stuttgart published a series of interesting observations on the egg-laying peculiarities of this singular bird. He attempted to prove, and with considerable success, that the egg of the cuckoo agrees in colour with those among which it is placed. That she can voluntarily influence the colour of her eggs! He enumerates the nests of thirty-seven species - to which list the editor of the *Ibis* has added fifteen—frequented by the cuckoo. There is certainly a very remarkable resemblance in many cases between the egg of the cuckoo and those of the species whose nest is selected, though there are notable exceptions, such as that of the hedge-sparrow, whose blue-green eggs bear no resemblance to the colour of any egg laid by the cuckoo. In this case, however, it may be that the hedge-sparrow is one of those species more easily duped than others, so that deception of colour is not necessary.

Mr Howard Saunders, in writing of the Great Spotted Cuckoo, a European species, says it invariably deposits its egg in the nest of the magpie. She carries her egg in her gullet, inserts her head into the magpie's nest, and deposits the egg; she then abstracts one of the magpie's eggs, crushes it, and smears her mouth with the yolk; she then returns to the magpie's nest, rearranges her own egg, and leaves it smeared with the broken yolk. Is this a case of deception intended to disguise the secret?

By dissection it has been calculated that each hen cuckoo will lay about half-a-dozen eggs, so that she must find an equal number of nests in a state to receive her own, just before the birds are about to sit. Most other birds lay their eggs on consecutive days, but a special provision is made to enable her to retain her eggs longer than they, seeing it might often be difficult to meet with the requisite number of nests suitable for the purpose. Reckoning five young birds to be the average number found in each nest, it therefore remains that for each brood of cuckoos, upwards of a score of innocents have mercilessly to be slaughtered. We must regard this as a curious freak in nature.

Since writing the above, I have been informed by a practical naturalist that the parent cuckoo devours the young birds that have been so ruthlessly expelled from their dwelling-place, and that it in a great measure depends on such food for subsistence at a period when the eggs of small birds have become scarce. If this be really the case, the difficulty is cleared away with respect to nature's performance of a work which appears to be very cruel, and at the same time without any pre-designed object in view. It changes an act which at first sight we are unable to justify, into a wonderful ordination of that Providence Who is mindful of the wants of all creatures.

My friend goes further, and declares that the cuckoo will not unfrequently attack a brood of birds into whose nest no alien egg has been dropped; but its difficulty is to get them out, for the nest even of the hedge-sparrow is so enveloped in thorns as to render access extremely difficult for a bird larger than itself. The cuckoo, when urged, as it is supposed, by hunger, will sometimes tear a nest to pieces, and feed on the young ones. This carnivorous propensity is the more deserving of credence from the fact that there has been for ages a wide-spread belief amongst gamekeepers, that hawks in the spring turn into cuckoos, and that they resume their own shape prior to leaving our shores.

Naturalists tell us that the cuckoo has been observed sometimes to throw out some of the eggs from the nest in which she deposits her own. And no doubt she feasts upon them afterwards; for, though I do not deny that the bird takes caterpillars—chiefly hairy ones—and insects, yet I believe that the eggs of small birds form a portion of its diet, whenever they can be procured. Were caterpillars and insects the sole food of the cuckoo, we should hardly expect her to quit our shores at a time when it is the most plentiful. And assuredly the heat of our summers is seldom so excessive as to drive away a visitor which is known to flourish in higher temperatures than our own. The departure of other migratory birds is regulated by the failing supply of food, and not by a particular day of the month.

The cuckoo has no more to say,
When the sun has reached old midsummer day,

is a saying in the west of England. But though it is quite true that the note of this bird is rarely heard in England after the above-mentioned date, the majority of its companions have ceased their say full ten days or a fortnight before that time. The fact of solitary instances of the cuckoo's note having been heard even as late as September, must not be taken as proof that none of the birds have departed before then. They leave when food becomes scarce; and if, by any means, food could continue to be supplied, there is no reason why they might not remain with us until driven off by downright cold.

Many attempts have been made to keep the cuckoo over the winter, but in most instances without success. Mr Templeton of Cranmore, near Belfast, secured a young one in July 1822, which lived for more than a year in his house, and became quite domesticated. It was generally fed on hard-boiled eggs, and occasionally with caterpillars; it would sometimes eat forty or fifty at a time. A seeming treat was a little mouse about one-quarter grown, which it would hold in its bill and beat against the ground, or anything hard, until the animal became soft, when the bird shewed great powers of extending its throat and swallowing. It was at last killed, by being accidentally trodden upon; otherwise, there is no reason why it might not have lived much longer. It seems reasonable to suppose that in this instance the cuckoo was provided with its proper food, eggs, caterpillars, and young mice; which exactly corresponds with what is said above, concerning its aliment in a state of nature. If in captivity it was delighted to devour a young mouse, we may readily conceive that when at liberty it would

be equally ready to enjoy the young birds so unconsciously provided by its own offspring. As an instance of the fascination the young cuckoo appears to exercise not only over its foster-parents, but birds in general, a case is related of a gentleman in Shropshire who kept a young cuckoo in a cage. The bird, however, shewing signs of restlessness, was set at liberty, and for some time afterwards remained perched on some railings in front of the Hall windows. During this time it was constantly visited by swallows, who were repeatedly seen in the act of feeding it, as if it had been one of their own!

THE NIGHT-JAR.

Well do I remember the feeling of awe that filled my mind when on a silent night I first heard the squeaking note of that curious bird the Night-jar or Goatsucker. Surprise and pleasure took the place of awe when, from observation, I found the night-jar to be of a shapely form, covered with a beautiful plumage, speckled with a variety of brown, gray, and white, harmoniously pencilled about the neck, wings, and tail. It possesses a full bright eye; but its mouth is enormously large, and furnished with stiff bristles, which are of great service to the bird on its nocturnal ranging in pursuit of prey.

The night-jar has often been mistaken for the cuckoo, although in habit and character it is much more nearly allied to the swift. It lays its eggs in long grass, generally by the wood-side, attends to the process of incubation, and feeds its young ones, which usually are two in number. This has led some writers to declare that the cuckoo has occasionally been observed to sit on her own eggs and feed her own young; but from the observation of years, I am compelled to maintain a different opinion. The error has probably arisen from a confusion of the identity of the two birds, which somewhat resemble each other in the early stage of their plumage. In the daytime, the night-jar remains on a tree, perched in a peculiar manner, not crossways, but *lengthways* along the branch, and generally head downward. It is extremely difficult to get sight of the bird in this position, and I have sometimes made a search for days without success, even when quite certain of the tree in which it was secreted. In the evening it will fly out to renew its nightly labour, in pursuit of the larger moths, and insects generally. In this chase it is interesting to observe the swiftness and variety of its motions. No bird I have ever seen can tumble so dextrously in the air. The rook, and even the tumbler pigeon, must yield the palm to the night-jar in this respect.

What enables certain birds to perform such evolutions whilst on the wing is a subject which cannot be satisfactorily explained. Many theories have been advanced, but not one of them is altogether free from difficulty. The middle toe of the night-jar is serrated, having teeth like a saw, and it has been suggested that such a provision has been made to enable the bird to use it as a comb, for the purpose of ridding itself of vermin, with which it is more than ordinarily infested. The same has been said of the rook, but neither she nor the pigeon has the serrated claw; whilst, though herons are so armed, it may be doubted if they can use the instrument for such a purpose.

If it be said that some birds are armed with serrations to enable them more readily to retain their prey, the objection is immediately raised, that the teeth would have inclined backward, and not forward, as is in reality the case. The subject is well worth the close observation of all lovers of nature. The night-jar, like many other unfortunate individuals, has suffered greatly from a wide-spread but ridiculous prejudice. It is known in some parts as the 'goatsucker.' The idea probably originated from the fact of the bird having been seen to extract the larvæ that infest the skin of the goat. Night-jars are migratory, arriving in May, and taking their departure in September.

THE CORN-CRAKE.

Of another neighbour of ours, the Corn-crake, I shall only say a few words. He is a sly and cunning fellow, up to all kinds of tricks in the matter of self-preservation, which, as we all know, is nature's first law, and therefore not to be condemned. His note is very peculiar crake-crake, crake-crake, and confined to the male bird when calling his mate. This call may be readily imitated by taking a strong comb, such as groomers use in the stable for dressing the manes of horses, and by drawing a nail smartly across the teeth. With a little practice, the bird itself can be deceived, and will come very near to the spot where the person is stationed.

The voice of the corn-crake is heard in the month of May, and, if the season be late, in part of June. Sometimes, on a summer's evening, I have walked full half a mile along a road on the side of some meadows near my residence, and the bird seemed to keep pace with me the whole way, at no great distance within the hedge; if I turned, I could readily imagine it to have done the same. This must have been the trick of a ventriloquist, for I have sometimes asked a friend to remain stationary, or to walk in an opposite direction, and the sound of the bird's voice had precisely the same effect on his ear. This power to deceive two persons who are walking in opposite directions, is really very wonderful. I have wandered about a field in which I knew the bird was located, and have heard its voice before me, and the next instant far behind on the course I was taking; now on my right hand, then on the left; at one moment close by, and almost instantly in the distance. It would have been impossible for the animal, however dexterous, to have placed itself in such various localities, whence its voice appeared to issue, in so brief a space of time. Occasionally, I have suddenly come almost upon it in reality, and then its note was uttered rapidly and with unmistakable feelings of alarm. At the same time I have seen it for a moment, and have traced its course in the grass for a few feet; but run as I would, it was off, and its voice sounded in the distance before I could recover from my surprise. I have known the corn-crake to be run down by the help of a dog, and thus captured. I remember also to have seen an active young farm labourer who pursued one of those birds in an open field for a considerable time, and eventually knocked it down with a stick. In that case, however, the bird had no cover. The hen lays from twelve to fifteen eggs; and in six weeks after they leave the shell, the young birds can shift for themselves. Their flesh is considered a great

delicacy. A bird that lays so many eggs, and whose flesh is regarded as a *bonne bouche*, one should suppose would be in great favour with the *gourmand*. But, as far as I know, they are seldom killed. I have rarely seen them exposed in shops for sale; nor can I ascertain that any persons of my acquaintance are much more familiar with them than myself, as an article of food. And yet they do not seem to increase. They must either be exposed to the ravages of numerous foes, as stoats, rats, weasels, and the numerous catalogue of egg-sucking birds; or, as I strongly suspect, the corn-crake, or land-rail, is much sought after abroad; for, instead of becoming a veritable water-hen, and hibernating at the bottom of ponds, as some believe, it is—like the two other subjects of this paper—a bird of passage, which leaves our shores in October, and crosses the Channel for the continent; though, during the greater portion of its stay in England, it can seldom be induced to take entirely to the wing. For that there is a good reason. When assisted by its wings, like the ostrich, it makes good speed; but in a proper flight it progresses but slowly, with its legs hanging down in an awkward-looking manner; yet, aided by the powerful influence of instinct, this creature will find its way to the south of France or Italy, and return to its old English quarters in the following spring.

COUNTRY JUSTICE.

The following lines, from a poem entitled *Country Justice*, were written by Dr John Langhorne, a clergyman of the last century. The allusion in the last six lines to the dead soldier and his widow on the field of battle was made the subject of a print, which happened to be in the room in which Sir Walter Scott met Burns for the first and only time. On reading the passage—which is printed at the bottom of the picture—Burns shed tears, and Scott, then a lad of fifteen, was the only person present who could tell him where the lines were to be found. The passage is beautiful in itself, but this incident will enshrine and preserve it for ever. The print is preserved in the Chambers Institution at Peebles.

For him who, lost to every hope of life,
Has long with Fortune held unequal strife,
Known to no human love, no human care,
The friendless, homeless object of despair;
For the poor vagrant feel, while he complains,
Nor from sad freedom send to sadder chains.
Alike if folly or misfortune brought
Those last of woes his evil days have wrought;
Believe with social mercy and with me,
Folly's misfortune in the first degree.

Perhaps on some inhospitable shore
The houseless wretch a widowed parent bore;
Who then, no more by golden prospects led,
Of the poor Indian begged a leafy bed.

Cold on Canadian hills or Minden's plain,
Perhaps that parent mourned her soldier slain;
Bent o'er her babe, her eye dissolved in dew,
The big drops mingling with the milk he drew,
Gave the sad presage of his future years,
The child of misery, baptised in tears.

A HIGHLAND PARISH IN THE LAST CENTURY.

In giving to the public a book entitled *Reminiscences of a Highland Parish*, the late Dr Norman Macleod has conferred a boon upon all who can appreciate simple, homely pleasures, or whose sympathies are natural enough to be touched by the relation of Highland rural life in the last century. When we enter the parish with him, it is not alone the scent of the heather, or the solitary grandeur of hill and loch and precipice, that we feel and see; our impressions of nature become as lively, our sympathies as warm, our hearts as expansive as his own. We learn to judge things by another standard; a simpler, purer moral atmosphere surrounds us; we realise how it is possible to be good without being socially great, to have but a slender purse, and yet to be amply endowed with all those choicer blessings with which Nature dowers her own aristocrats; to live a quiet retired life, far from the world and its busy haunts, and yet to be constantly surrounded by objects of interest and affection.

This book, one of whose chief and most enduring charms is its vivid naturalness, begins with a description of a Highland parish as it existed more than ninety years ago, compiled from materials which the reverend doctor was happily enabled to possess himself of—a large parish in the Isle of Skye, containing somewhere about two thousand souls, and comprising an area of one hundred and thirty square miles, with a sea-board of a hundred. It had two churches, which ‘the minister,’ as Dr Macleod loves to call him, tells us were little better than sheds. They contained few or no seats; and the congregation, sometimes dripping wet, and often footsore and weary, stood during the service, having the good fortune in this case to listen, after their fatigues, to an eloquent and earnest, instead of a prosy and careless sermon.

The manse, to which we are introduced on the title-page, was a homely, comfortable dwelling, surrounded by a cluster of cottages, stables, and offices, and sheltered by some old trees. The

glebe was large; and in addition to it, the minister rented a small farm, the profits of which eked out his scanty income of forty, and latterly eighty pounds a year. Thus, in the small world of the parish, the manse became the centre of a still smaller world of its own; and the world-portraits of one or two of the odd characters who found shelter beneath its roof, or in one or other of the tiny cottages that nestled in cosy nooks in the glebe, are in their way inimitable.

In every Scottish parish is to be found a ‘minister’s man,’ a factotum who discharges various duties in connection with the manse (clergyman’s house) and the church: he is, in fact, the minister’s body-guard, and is usually looked upon as a privileged retainer. We have an admirable specimen in ‘Wee Rory’ or Old Rory, as our ‘minister’s man’ was named, in the parish under notice. Here he is: ‘Wee Rory was rather a contrast to his master in outward appearance; one of his eyes was blind, but the other seemed to have stolen the light from its extinguished neighbour, to intensify its own. That gray eye gleamed and scintillated with the peculiar sagacity and reflection which one sees in the eye of a Skye-terrier, but with such intervals of feeling as human love of the most genuine kind could alone have expressed.’

Old Rory was a dexterous fisher, a capital boatman, a true-hearted, honest, faithful creature, devoted to the minister while he lived; and the story of his death, which took place not long after that of his master, is among one of the most touching incidents in the book.

Then there was old Archy, and James the tutor, and the little one-legged governess, and old Jenny the hen-wife, who had been the nurse of the children, who had received them all into her arms at their birth, and whose sad duty it had been, when death invaded the happy manse circle, to array them for their last long sleep, as she had dressed them for their first.

Then last, not least, we have the minister’s wife, whose portrait is sketched for us in a few masterly touches. A true good woman she must have been, ‘a blessed angel in the house,’

managing all household matters within and without; overseeing everything, contriving somehow that every wheel of the domestic economy should run smoothly, and that her husband, good man, should not be too much harassed by the anxious, ever-recurring thought of how to feed, and clothe, and educate the bairns. Of these, no fewer than sixteen were born and reared in this sweet secluded home. Precluded by circumstances from the enjoyment of many of the luxuries wealth alone can procure, they were so surrounded by an atmosphere of cheerful love, that they were unconscious of the want of anything else. The manse was emphatically a happy home; and the intercourse between parents and children was, as it always is in such cases, frank, unrestrained, kindly, and loving. There was no attempt to frown down innocent mirth: the minister, we are told, who was an excellent performer on the violin, loved to exercise that gift as much as any other he possessed, 'and liked to see his boys and girls dancing in the evenings.' He had eight girls, 'a heavy handful,' as he himself puts it; and perhaps the most charming, and one of the most useful chapters in the book is that in which we read of the education of these girls—how they were trained to be good, loving, true, womanly, domestic, and at the same time refined and cultivated women; how they retained, with all their love of books and nature, a womanly taste for the becoming, which was exemplified in the wonderful skill and ingenuity they manifested 'in making old things look new,' and in so changing the cut and fashion of the purchases made long ago from the packman, that Mary's everlasting silk or Jane's merino seemed capable of endless transformations. Then the manse boys, when we see them hard at work at college, what fine, manly, open-hearted fellows they are; how unselfish, how kindly, how ready to share their small means with others poorer than themselves; not falling back on the slender paternal purse to supply the deficiency thus created, but stinting themselves in order to help some poorer fellow-student, such as 'Macmillan,' or the still more needy 'Macgregor.' The latter, in his gratitude for kindnesses received, insisted upon treating the manse boy in return, the treat consisting of the purchase of two half-penny rolls, one of which he handed to his benefactor, while he greedily devoured the other himself.

As a matter of course, a parish territorially so large, without a single road in it, unless a rude track along the shore could be dignified by the term, involved an immense amount of work, compared to which the preparation of the weekly sermon was a trifle. Walks of sixteen, eighteen, or twenty miles over rough moors, and rapid bridgeless streams, and through shifting, insecure bogs, made part of the ordinary routine of the minister's life. Such feats of pedestrianism were varied by long rides—one of seventy-two miles at a stretch is recorded—and long boating journeys, in which his boys, and his faithful man Rory, were his companions in his boat the *Roe*. Sometimes, in these voyages of the *Roe*, scenes occurred which might well blanch the cheek of a landman, when the wild seas rose, and the gale rushed to meet the rising tide, and a huge pyramid of green water, flecked with foam, threatened to engulf the tiny boat; and the slightest error on the part of Rory the steersman must have

proved certain destruction to all on board. How Rory was found equal to his task, and how the *Roe* weathered many a stiff gale and heavy sea, are narrated in a manner so graphic and interesting, as must make that chapter, we should suppose, a special favourite with all boys. Not unfrequently, the minister held his dicta of catechising, with the sermon which followed, in the open air. On these occasions, he would be seated on a grassy knoll with his rustic hearers around him, the rude psalmody of his audience, sweet as the trill of the mountain lark, ascending right from the heart of the worshipper through Nature's glorious temple of hill and moorland, straight to Nature's God.

Sometimes children were brought to a wild, secluded glen called Corrie Borrodale, that the minister might baptise them there beside a mountain spring; and to the same place couples occasionally came to be married, it forming a sort of half-way house between the two extremities of the parish. In this daily fulfilment of humble, if you will prosaic duties, the minister lived, a noble, God-fearing, self-denying, hard-working man, far removed from those church politics and party differences which are too apt to sour the most kindly natures, and infuse a spice of gall into even gentle and loving hearts; and here, when he was almost eighty years of age, he came to an end composedly and peacefully. With his life ends what may be called the personal history of the manse; but the interest of the book continues, and is sustained as vividly as before.

Touching on the vexed question of the poor-laws, Dr Macleod has a few suggestive sentences full of kindly wisdom. About the Highland peasantry, the class from which the bulk of the minister's parishioners were drawn, we have much interesting information, as also about the tenants and tacksmen, a well-nigh obsolete race, who have been extinguished by the modern system of letting the land in large sheep-farms. A feast at the house of one of these tacksmen is described, which may well make the mouth of an epicure water, especially if he had prepared for it by a sixteen or seventeen miles' walk across hills and bogs and heathery moorlands. Here is the bill of fare: 'Oat-cake, crisp and fresh from the fire; cream rich and thick, and more beautiful than nectar,' whatever that may be; 'blue Highland cheese finer than Stilton; fat hens slowly cooked on the fire in a pot of potatoes without their skin, and with fresh butter—"stoved hens," as the superb dish was called; and though last, not least, tender kid roasted as nicely as Charles Lamb's crackling pig.'

Then we have stories of the snow-storms which occur so often among the hills—that of the widow and her son is exquisitely touching and pathetic—succeeded by some solemn, tender talk about churchyards and funerals. The Celt, we are told, has a strong desire, almost amounting to superstition, to find a last resting-place beside his kindred; and this desire sometimes gives rise to incidents that are almost ludicrous; as when a Highland porter in Glasgow cuts off his finger, and sends it to be buried in the churchyard of the parish, accompanying the amputated member with a bottle of whisky, that its obsequies may be celebrated with all due honour! Among the peasantry, we find that a superstitious belief, not unknown in other parts of the country, prevails—namely, that

a death is often preceded by the appearance of a shadowy phantom funeral, or a warning of its approach given by some such common occurrence as the howling of a dog or the crowing of a cock. During the interval between death and interment, many peculiar customs prevail, which are apparently Roman Catholic in their origin; but one curious superstition they have which seems exclusively Highland; they fancy that the person who is last buried has the dreadful task committed to him of keeping watch over all the graves in the churchyard—a weird wardenship from which he cannot be set free until another death takes place and another grave is opened. In the tale of the Grassy Hillock, we have a very touching account of a Highland funeral. Flory Campbell, a poor widow bereaved of a kind and dutiful son, is the heroine of the tale; and in the mingled dignity and simplicity of her character, in the wild pathos and vigour of her improvised lament, we seem to learn more than volumes of mere dry prosaic description could have told us, of those ‘flowers’ of the Scottish Highlands whom poverty and emigration have now so nearly waded away.

Of course no description of a parish could be complete without some notice of the schoolmaster, who is as necessary an adjunct to it as the minister himself; and a very worthy, painstaking, hard-working class of men the Scottish dominies generally are. A pleasant picture we have here of the comfortable relations that in bygone days often subsisted between the schoolmaster and the minister. The day has been wet, cold, infected with the gloom of a north-easter, utterly depressing alike to body and soul; when, towards the close of the miserable evening, the dominie steps up to the manse. He knows he will be welcome; who but he can so thoroughly ‘red’ up the news of the parish, can so accurately separate the conflicting currents of gossip, and sift the true from the false! The delicate matters affecting the public morality discussed, he next tells his parochial chief all about the sick and suffering—how Sandy Macglashin has broken his leg, and Widow Macleay’s big family are down with the measles; and the minister listens with a sympathetic face; and together they consult about the manner and amount of the relief to be afforded to each. Then the preachers at the last sacrament are criticised, and the different styles of preaching discussed; and church and state politics receive a heckling, and various abstruse points of theology are considered; and the rain and mist clearing away, they saunter out in the gray twilight to look at the glebe; and the conversation turns upon the state of the crops, the prospects of the harvest, and the grand question, as affects the minister’s stipend, of whether the next fairs prices will be high or low.

How true to the life all this is—how real! How many of us can imagine the pleasant room to which the minister and dominie return to finish their crack. The cheerful little fire burning in the grate, and the cosy supper of toasted cheese or dropped eggs which follows, with its accompanying glass of ale or modest tumbler of toddy. The emoluments of the schoolmaster, like those of the minister, were very poor indeed, but he was held in honour and respect in the parish. ‘There were few marriages of any importance,’ we are told, ‘at which he was not an honoured guest; in times of

sickness or death, he was sure to be present, with his subdued manner, tender sympathy, and Christian counsel.’ The schoolmaster’s ordinary bill of fare did not contain, we scarcely need to be told, many delicacies, although one is mentioned which might well awaken admiration even in the breast of a Soyer. This is *fuairin*, a Highland dish composed of dry new meal, freshly ground in the quern, and then whipped up with rich cream. ‘Lucky,’ says the reverend doctor, recalling the days of his youth, ‘was the boy who got it.’

Then comes a famous batch of ‘fools’—Allan of the dogs, Donald Cameron, barefooted Tachlan, and light-headed Archy, who had more wit and repartee in his slenderly furnished cranium than many a wise man has in his. How he turned the tables upon his clerical host, a respected minister in Skye, is seen by the following amusing anecdote: ‘An old acquaintance of mine, a minister in Skye, who possessed the kindest disposition and an irreproachable moral character, was somehow more afraid of Archy’s sharp tongue and witty rhymes than most of his brethren. Archy seemed to have detected intuitively his weak point, and though extremely fond of the parson, yet he often played upon his good-nature with an odd mixture of fun and selfishness. On the occasion I refer to, Archy in his travels arrived on a cold night at the manse when all its inmates were snug in bed, and the parson himself was snoring loudly beside his helpmate. A thundering knock at the door awakened him, and thrusting his head, enveloped in a thick white night-cap, out of the window, he at once recognised the tall, well-known form of Archy.

“Is that you, Archy? Oich, oich! what do you want, my good friend, at this hour of the night?” blantly asked the old minister.

“What could a man want at such an hour, most reverend friend,” replied the rogue, with a polite bow, “but his supper and his bed!”

“You shall have both, good Archy,” said the parson, at the same time wishing Archy on the other side of the ‘oolins. Dressing himself in his home-made flannel unmentionables, and throwing a shepherd’s plaid over his shoulders, he descended and admitted the fool. He then provided a sufficient supper for him in the form of a large supply of bread and cheese with a jug of milk. During the repast Archy told his most recent gossip and merriest stories, concluding by a request for a bed. “You shall have the best in the parish, good Archy, take my word for it!” quoth the old dumpy and most amiable minister. The bed alluded to was the hay-loft over the stable, which could be approached by a ladder only. The minister adjusted the ladder and begged Archy to ascend. Archy protested against the rudeness.

“You call that, do you, one of the best beds in Skye? You, a minister, say so? On such a cold night as this too? You dare to say this to me?”

The old man, all alone, became afraid of the gaunt fool as he lifted his huge stick with energy. But had any one been able to see clearly Archy’s face, they would have easily discovered a malicious twinkle in his eye, betraying some plot which he had been concocting probably all day.

“I do declare, Archy,” said the parson earnestly, “that a softer, cleaner, snuggler bed exists not in Skye!”

“I am delighted,” said Archy, “to hear it,

minister, and must believe it, since you say so. But you know it is the custom in our country for a landlord to shew his guest into his sleeping apartment, isn't it? and so I expect you to go up before me to my room, and just see if all is right and comfortable. Please ascend!"

'Partly from fear and partly from a wish to get back to his own bed as soon as possible, and out of the cold of a sharp north wind, the simple-hearted old man complied with Archy's wish. With difficulty, waddling up the ladder, he entered the hay-loft. When his white rotund body again appeared as he formally announced to his distinguished guest how perfectly comfortable the resting-place provided for him was, the ladder, alas! had been removed, while Archy calmly remarked: "I am rejoiced to hear what you say! I don't doubt a word of it. But if it is so very comfortable a bedroom, you will have no objection, I am sure, to spend the night in it. Good-night, then, my much-respected friend, and may you have as good a sleep and as pleasant dreams as you wished me to enjoy." So saying, he made a profound bow, and departed with the ladder over his shoulder. But after turning the corner and listening with fits of suppressed laughter to the minister's loud expostulations and earnest entreaties—for never had he preached a more energetic sermon, or one more from his heart—and when the joke afforded the full enjoyment which was anticipated, Archy returned with the ladder, and advising the parson never to tell *jibs* about his fine bedrooms again, but to give what he had without imposing upon strangers, he let him descend to the ground, while he himself ascended to the place of rest in the loft.'

All we find in this pleasant volume is genuine and real; here there is no sham, no quack morality, shallow and one-sided. Its teachings are full of charity and kindness, the natural outcome of a faith as full and comprehensive as the large loving heart that harboured it.

FALLEN FORTUNES.

CHAPTER XXVI.—THE WORM TURNS.

THE house in Carlignin Place was as yet unchanged in every respect—just as Dalton had left it on his quitting town—yet everything spoke of gloom and desertion. It was no longer his home, except in name; and in a few days it would lose even the designation. He felt that he could not eat his dinner there, but went out to dine at his club. London was what is called 'empty;' there were only a few millions left in it, who could not afford to go into the country; Piccadilly was a solitude, Pall Mall a waste. Dalton felt qualms as he drew near his club, imagining that every one there would have heard tidings of his downfall, and that he would be looked upon with pitying eyes. He knew how weak it was in him, how false the pride that made him entertain such apprehensions, how altogether vain and egotistic were such feelings, as well as the wisest philosopher that ever founded a school; but so it was. His fears, however, were groundless, for there was not a soul in the place.

The reading-room, ordinarily so thronged at that preprandial hour, was absolutely tenantless; he

might have had six *Pall Mall Gazettes* all to himself. In the huge dining-room of the *Plesiosaurus*, he was the one solitary guest; but as he was about to sit down to his modest repast, there entered one Dawkins, and begged permission to join tables. Dawkins was a middle-aged bore, who could never forget that he had once been a member of parliament. He prefaced every statement with 'When I sat for Siddington,' and dated every event from his admission into 'the House.' No one could have imagined from his conversation that that halcyon time had lasted but six weeks, after which he was unseated for bribery, on petition. By profession he was a civil engineer, and had gained some notoriety, which could scarcely be called fame. He had not invented a tubular bridge, or a submarine tunnel; but he had nursed more than one railway successfully through its sickly childhood, and had found his own account in it—at his banker's. His enemies averred that, in his professional capacity, Mr Dawkins, C.E., had had his hands 'greased;' and even his friends allowed that he was an excellent authority upon coal contracts. Under ordinary circumstances, the most that this gentleman would have got out of John Dalton, in the way of social acknowledgment, would have been a careless nod of the head, and he would have felt himself flattered even by that; for Dalton was one of the most popular men in the club, and in the best set, and Dawkins was nobody there. How he had got into the *Plesiosaurus* at all—which, for so large a society, was somewhat exclusive—was a marvel to those who knew him best: perhaps he had slipped in by greasing somebody else's hands.

On the present occasion, however, Dalton rather encouraged his advances. This was just the man to have heard, in all likelihood, of his altered circumstances, and he did not wish to seem to shrink from companionship, or to appear in dejection. Moreover, even the talk of Dawkins was better than his own sad thoughts.

'Sorry to see you missed your shot at Bampton,' said this gentleman in a more familiar tone (or so it seemed to the other) than their previous relations justified. 'However, you will try again, of course; it is quite unusual to get one's seat at the first trial. I was fortunate myself in that respect, when I stood for Siddington, but it was quite an exceptional piece of good luck.'

For the constituency it doubtless was so, since it got two elections, and all the good things 'going' at such epochs, within two months; but the good fortune of Mr Dawkins himself had certainly been of a very transient nature.

'I am not likely to try again,' answered Dalton coldly.

'Ah! found it expensive, I daresay. That is the worst of it. But it's a proud position too—deuced proud. I shall never forget the day I first took my seat and the oath.'

'I wish you would,' thought Dalton cynically. The man's impudence annoyed while it amused

him. 'How comes it,' he asked, 'that you are up in town in a dead time like this?'

'You may well ask. There are a lot of fellows bothering me by every post to run up to the moors, and Warkworth offered me a berth in his yacht. But I am chained to my desk. A golden chain, I'm happy to say, but still it confines me to London for the present. Business, business, my dear sir; you know what that is?'

'Yes; it is very familiar to me.'

'Not more familiar than welcome, I hope, eh?' put in the other. His tone was indifferent, but the glance and manner which accompanied it were so eager and inquisitive, that the contrast was supremely ridiculous. Dalton's sense of humour was tickled.

'Well, I suppose you know all about it?' said he good-humouredly. 'You have doubtless heard that I have been hard hit?'

'I did hear something of the kind, my dear sir; but people tell such lies. I had hoped the report was without foundation. Sorry to find it confirmed on such good authority, I'm sure.'

'Thank you,' said Dalton dryly. He was wondering whether it would be worth while asking this man's advice (he was sharp enough in his way, and especially in speculative affairs with a flaw in them) as to the Brazilian mine.

'Not at all,' continued Dawkins loftily. 'We are all sorry; every man who is worth anything in the club, sir, sympathises with you. A man at your time of life, and in your position, to become the prey of a parcel of swindlers; it is terrible. I had no idea, however, you had gone such a—I mean, that the thing was so serious. I had hoped you were only "winged."'

'No, sir, I am shot,' said Dalton decisively. He spoke so loud that the waiter came, thinking that something was wanted.

'Get some champagne,' said Dawkins: 'the best—the Clicquot—do you hear?' Then, in a confidential voice, he added: 'There's nothing like champagne, my dear sir, when you are down in the mouth. I remember, when I stood for Siddington, and my opponent was ahead'—

'If that champagne is for me, Mr Dawkins, I don't drink it,' observed Dalton, in a tone more decidedly *frappé* than the wine itself.

'Very good; then I'll drink it myself,' replied the other cheerfully. 'Now, look here, Dalton; don't be cast down, and bitter with your friends, and that sort of thing. Of course, it's infernally disagreeable to have thrown one's money into the gutter—or down a mine—which is the same thing; but there are ways of getting it out again.'

'What! you think the *Lara* is worth something yet?' inquired Dalton eagerly.

'Not I. It is not worth a shilling: it is not worth sixpence. But money is to be made, my dear fellow—the too friendly phrase jarred upon Dalton's nerves, but he let the other run on: he might really have something to say that would be useful—'thousands are to be made—ay, and tens of thousands—if you only go the right way to work, and with the right people. There's the rub.'

'And who are the people?' inquired Dalton, growing somewhat impatient of his companion's platitudes.

'Well, there's Beevor the banker—he is a baronet now, you know, though I can remember him when his firm was a very one-horse affair;

his wife is a leader of fashion—quite the *ton*, you know.'

Dalton could not restrain a smile. Sir Richard Beevor was understood to be a dull man, who, placed by birth in a comfortable financial groove, had, under certain favourable circumstances, made a considerable quantity of money; but his great *coup* was his marriage with the widow of an eminent gin-distiller, which had heaped his money-bags so high that the government—to which he gave his parliamentary support—were compelled to take notice of them, and had in consequence made him a baronet. Sir Richard he had met on one or two occasions in society; but his lady, never for she had no chance of being admitted into it.

'Now, if you really want, Dalton, to be made *an* *faul* with the best things going' (Mr Dawkins's countenance became mysteriously serious; and Dalton looked serious too; his mind was occupied for the moment in philological speculation: why was it that men like Holt and Dawkins *would* use French phrases?)—'if you want to see the best people, financially speaking, that are to be met anywhere, and to have an opportunity—who knows?—of being connected with them'—

'Well, what must I do?' interrupted Dalton sharply; he thought he had schooled himself to stand anything without flinching, but he could not stand Dawkins eloquent.

'Why, you must come and dine with me to-morrow, and meet 'em.'

'Very good; I will,' said Dalton. He could not express much gratitude for the invitation, but his manner was more cordial than his words. He knew—or certainly he would have known a few weeks ago—that it was he who was conferring the obligation. Mr Dawkins would have given his ears, if, in the height of last season, he could have secured John Dalton as a guest. But on the other hand, it was just possible that the man really meant to do a kindness, and perhaps a service to him, in asking him to meet these kings of commerce. At all events, Dalton had nowhere else to go, and any society just now seemed to be preferable to his own. He even reflected with a bitter smile that his acceptance of Mr Dawkins' hospitality would save him the expense of a dinner.

He was now always putting in practice little economies which annoyed him, and was ashamed of himself because they did so. On the morrow he had to see his lawyer, the auctioneer, and Mr Skipton, who had promised to buy his horses; and instead of taking a Hansom, he patronised the omnibuses. Novelty, it is said, is always pleasing, and therefore he ought to have enjoyed the experience of being jolted and squeezed and trodden upon in those vehicles, in none of which he had ever set foot before. He was perfectly conscious that thousands of his fellow-creatures, in most ways equal to himself, and in many superior, were compelled to use this means of conveyance, and that it was a wretched affectation and a contemptible exclusiveness that made it disagreeable to him, much more than its intrinsic inconveniences; but he disliked it very much for all that. He could not shake off, in such general considerations, the thoughts of his own belongings; and when he saw the little batches of nervous and delicate women waiting in the wet for the 'bus to arrive, and struggling for inside places when it did so—an everyday occurrence, but which had never attracted

his attention before—his mind reverted to his wife and Kate, who now, if they lived in town, and wished to get about, must needs form part of that patient throng.

There is nothing like a change—for the worse—of fortune to make people understand that enigma so often talked about, but which so few trouble themselves to solve, how the 'other half' of the world live and move. It seemed to Dalton that next to 'mud-larking'—picking up other folks' coppers in the ooze of the river at low tide—there was nothing more unpleasant than this looking after one's own shillings and sixpences. What galled him still worse were the manifest efforts of his acquaintances to save him small expenses. Mr Skipton, Q.C., was a well-meaning man in his way; but if he had had any delicacy of mind to start with, he had thrown it overboard, for the freer practice of his profession; and he very nearly lost his friend altogether (and what he would have regretted quite as much, his horses), through attempting to treat Dalton to luncheon at the club.

Towards evening, Mr Dawkins called for him, as had been agreed upon, to take him on to his house, which was some way out in the suburbs; and was so resolute in paying for their common cab at the end of their journey, that Dalton was within a very little of knocking him down at his own door-step.

'You know, my dear fellow, you must let your friends pay for you now,' said Dawkins, and that in so loud a tone, that the very footman must have heard it as he opened the door.

'Why did I promise to dine with this hound?' thought Dalton; while the other imagined him, perhaps, to be speechless with gratitude. But the host's coarseness had this good effect upon his guest, that irritation took the place of despondency, and he became quite prepared to play his part in the conversation of the evening, if not exactly to make himself agreeable.

Mr Dawkins was a bachelor; but his house was kept for him by a widowed sister, Mrs Jamrod, a lady of sour aspect, and a confirmed stiffness, which might have been the result of rheumatism, but was, in fact, her imitation of dignity. If she did not absolutely imagine herself to be a princess, she thought Dawkins a prince—this was a really good trait in her character, for he had been generous to her in a certain fashion—whose consanguinity ennobled her; and she honestly believed the great staring 'villa-mansion' in which they lived to be a palace. Her drawing-room fairly blazed with mirrors and gilding; the curtains were of the most brilliant damask; the sofas and conversation-chairs of the newest shapes; and the tables were loaded with books in such gorgeous binding, that they looked no more intended to be read than the centre ornaments of supper-tables to be eaten. They were not real, as Dalton presently discovered in conversation with his hostess, with whom he was left alone for a few minutes, while Mr Dawkins ran up-stairs to 'titivate,' as he called dressing for dinner.

'I know nothing of that class of literature,' she had replied austere to some question of his about a book; 'my dear brother wishes it to have its place here, and therefore here it is; but my own studies, I am thankful to say, are confined within a very small compass: I am only a humble searcher after the Truth.'

'If you find that in a small compass, my dear

madam, you must be exceptionally fortunate,' observed Dalton gravely.

'Sir, there are only two books—the Book and Hervey's *Meditations*—which, in my opinion, repay perusal. Over all the rest, time is spent in vain.'

'Would you exclude Young's *Night Thoughts* and Blair's *Grave*?' inquired Dalton deferentially.

'For myself, yes; for others, however—perhaps for you—they may have some edification.'

'No, not for me,' said Dalton solemnly. 'I am quite of your opinion as to them. If we have only our Hervey, that is sufficient in the way of complement and comment.'

'I am at once surprised and delighted to hear you say so, Mr Dalton. I had taken it for granted—I don't know why, I am sure, for Robert seldom speaks to me of his club friends—that you were by no means seriously inclined.'

'You never were more mistaken in your life, madam,' said Dalton grimly; 'though I don't mean to pretend that it has been always so.'

'Ah, you have had a blow—if anything can be so called that is only material, and affects our prospects in this world alone. So Robert has hinted to me. These trials are often sent for our good. Your chastening!—'

'I say, none of that, Jane,' cried Dawkins, suddenly presenting himself beside them—all shirt-front and watch-chain. 'You have got hold of the wrong man altogether, for that sort of stuff.—Here are the Beevors come, by Jove, first. Now, I am not going to have their dinner spoilt for anybody else, so mind we have it to time.'

The vulgarity of the man's voice and manner had never proclaimed itself so openly to Dalton's ears as now, in his own house. That he should have talked of his fallen fortunes to this hypocritical old woman, was wormwood to him; and from that moment he made up his mind to strike, and not to spare. So far as the lady was concerned, he was unjust, for she really believed—so far as belief was in her—the principles she professed; while there was certainly no breach of confidence in her brother having communicated to her the fact of Dalton's ruin, which was by this time common talk enough. However, he had laid his hand upon his sword, and like a soldier about to sack a town, was resolved to respect neither sex nor age.

At this moment, Sir Richard and Lady Beever were announced. The former was a fat, black, podgy man, with a habitually stertorous breathing, and an occasional habit of blowing like a porpoise, which rather electrified strangers. His wife, on the other hand, was tall and angular, and very careful of her breath indeed. She thought it inconsistent with her exalted position in society to open her mouth to common people, which she considered most persons who were commoners to be. To even her hostess, whose own dignity had vanished at the sight of hers—swallowed up by that Aaron's rod—she did but vouchsafe a few monosyllables. To Mr Dawkins she graciously extended three gaunt fingers covered with rings. When Dalton was introduced to her, she bent her head about a quarter of an inch, and raising her double glasses, surveyed him from head to foot, with a particularity that would have done credit to the Ordnance Department.

'I have heard of you before,' said she curtly.

'You have the advantage of me in that respect,

madam,' replied Dalton, in his most winning tones, 'as doubtless in many others.'

The shaft sped harmless, however, for the lady had already turned away to examine some new arrivals with the air of a naturalist who is investigating specimens of the ordinary beetle. They were common enough of their genus, it must be acknowledged. Gentlemen with pronounced noses, and mispronounced *Ds* and *P's*, with a cataract of shirt-front, embossed with jewels, and rimmed with the merest margin in the way of waistcoat—all of them of oriental complexion, but with ostentatiously Christian names. Gentlemen, again, with mutton-chop whiskers, and those lively airs with which business is tempered in the City; glib of tongue, elastic of step, and with that overdone geniality towards one another, which is their substitute for friendliness. The ladies were by no means so gushing; they were either depressed in manner, each watching her respective lord with a somewhat servile eagerness to obey the motions of his eye, or they were stiff and formal, some through more lack of ease, others from the consciousness of recently acquired wealth. Most of it had dropped from the skies (so far as they knew), and it was but natural that they should consider themselves as miraculously favoured. The talk of both sexes was of money: in the one case, of coin, pure and simple—stocks and shares, loans and premiums, surpluses and deficits; in the other, of money's worth, the cost of jewels, of lace, of furniture. It was like a gathering of brokers, and to some extent, perhaps it was one. Stiff and purse-proud as the richest might be, all prostrated themselves before Sir Richard and his lady—the two golden images which bullion and gin had set up. Every boastful, self-asserting voice toned itself down in addressing them; every remark became interrogative, deferential, and subject, as it were, to their supreme approval. Dalton noticed that most of those made by the men were prefaced with, 'A gentleman was telling me the other day, Sir Richard,' &c. &c. He had never before moved in circles, professing to be 'circles,' where men talked of 'gentlemen' and not of 'men.' It was probably rare, he surmised, for these persons to be addressed by a gentleman at all, and when it happened, they made a note of it.

Some of these persons looked inquisitively at Dalton, much as the commercial traveller had done in the train, as though they would say, 'In what line of business is *this* fellow?' They had the sagacity—perhaps the humility—to see that though among them, he was not of them; but that by no means conciliated the object of their curiosity. He was not used to appear in society and not be known. Their talk would have jarred upon him under any circumstances—it was like counting sovereigns out of a bag; but in his penniless condition, he resented it almost as though it had been a personal insult. He felt himself, though certainly without being overcome with sympathy for those about him, becoming gradually assimilated to them, degraded by their companionship, and losing, in some mysterious way, his individual character. If 'evil communications' had corrupted him, they must have had a very rapid effect, or irritation had greatly assisted their influence; but at all events, he was fast losing his 'good manners.' He hardly noticed which of the stiff females it was that Mrs Jamrod confided to his care to take down to

dinner—their dresses all rustled like bank-notes; they were all behung with chains and jewels, and, like the lady of Banbury Cross, made music wherever they moved—and for once neglected 'his duty to his neighbour.' The table was crowded with guests, two individuals instead of one being even placed at the top and bottom. Lady Beevor, as the only person of title present of her sex, was one of those who occupied this distinguished position, next the host, and Dalton was placed on the other side of her at right angles. Between the gilt candlesticks, and across the fruit and flowers, he thought he had never seen so many mean and vulgar faces before.

'Good gracious!' muttered he under his breath, 'are these the capitalists?'

'Sir,' said the lady upon his right, 'I did not catch your words.'

'I was wondering,' said he, 'who all these good people were; do you know?'

Dalton had an agreeable vivacity of manner that was greatly appreciated in fashionable circles; but at which his present neighbour was evidently considerably astonished, not to say scandalised.

'Hush!' she said; 'you know Lady Beevor surely—that is,' added she, with a reverent recollection of the rank of the person spoken of, 'at least by sight?'

'Yes, indeed; no one who has ever seen her is likely to forget her. It was gin, was it not, that "floated" her?'

'Floated her!' repeated the lady, quite aghast.

'Certainly. I remember her being brought out in the City; though Sir Richard in the end took all the shares. You have heard all about the distillery and the kick in the bottles, and so on; you must have heard it.'

'Oh, pray, don't, sir. She is looking this way. No one ever speaks of the gin now. You mustn't talk of her like that; you mustn't, indeed.'

All the starch had suddenly gone out of his companion; she was positively limp and damp with fear. If she had, however innocently, offended Lady Beevor, she felt that the gates of Paradise—that is, of Fashion—would be shut in her face; and she did so want to get in.

'Well, let us talk of some one else. Who is that funny little fellow opposite, who has dropped his watch-chain into his soup? Why the dickens does he wear such a chain?'

'Because I gave it him upon his birthday. That is my husband, sir.'

'You don't say so! You must have married very early; a great deal earlier than he did,' was the unblushing reply.

'Well, he is older than I, that's truth,' assented the lady, much conciliated. 'If you are in the City, the name of Binks will probably be familiar to you. I believe my husband is tolerably well known there.'

'Is it possible, my dear madam, that I am speaking to Mrs Binks?'

'Well, I believe Mrs Jamrod introduced us,' returned the lady, with a toss of her head that sent the camellia at the side of it swinging like a pendulum.

'Upon my life, I thought she said "Minx,"' replied Dalton apologetically. 'I was totally unaware of my good fortune—of the honour that had been conferred upon me.'

'Don't speak of it,' said Mrs Binks, with a gracious smile.

'Water!' suddenly exclaimed a commanding voice upon Dalton's left. It was Lady Beavor, speaking to the servant, as he thought; and as none of the domestics heard her, and a water-bottle was opposite to him, he leant forward and filled her glass. To his astonishment and indignation, she stared coldly at him, and drank the water without the slightest acknowledgment of his courtesy. Then it struck him, all of a sudden, that this woman had been speaking to *him* when she had said 'water.' He felt himself turning scarlet.

'You mustn't mind her ladyship's manner,' whispered Mrs Binks good-naturedly; 'she doesn't mean anything by it. I have heard her speak quite as brusquely to Mr Abrahams yonder.'

'Yes, but I am not Mr Abrahams,' said Dalton quietly. His mind was a volcano; he would insult the whole company, except the simple little creature at his right hand, who, unlike that woman from Gin Lane, really did not 'mean anything' by her *gaucheries*.

'Well, no; I suppose you have not made Mr Abrahams' three hundred and fifty thousand pounds,' returned Mrs Binks, not contemptuously, but with a certain touch of pity, which cut Dalton like a knife. Was it possible that even *she* had heard of his impecunious condition?

'How do you know that?' inquired he, smiling.

'Don't I look like a millionaire?'

'Oh, it is not *that*: you look quite the gentleman, I'm sure,' said she with *naïveté*. ('Quite the gentleman,' groaned Dalton to himself. 'What have I done to deserve these things?') 'Only I happened to hear up-stairs that matters had been going wrong with you: I hope they'll mend. There have been times when Mr B. himself has been anxious.' And she nodded towards her husband, who was tossing off a very large glass of champagne with an air of freedom from anxiety that Dalton envied.

'Thank you,' said he softly. He made up his mind, when the hour of retribution came, that he would spare the female Binks for her kind wishes.

Then he turned to Mrs Binks's neighbour—a lady in semi-mourning, and therefore unable, like the rest, to indulge her taste in jewellery, but who had contrived, by the aid of ostrich plumes and other sombre ornaments, to so nearly resemble a hearse-horse, that Dalton half-expected her to 'paw'—with an inquiry as to whether she had been to the last Crystal Palace Concert.

'I have never been to the Crystal Palace in all my life,' was the frigid reply.

'Dear me! You have religious objections, I suppose?' for he concluded that this particular specimen must be after the pattern of her hostess.

'Not that I am aware of,' answered the lady calmly—and always from a sublime height above her interlocutor—a pedestal of superiority. 'My objection to the Crystal Palace is that it is vulgar.'

'But *every* lady goes to the Crystal Palace,' put in Mrs Binks, with an air of remonstrance.

'That is why I do not go,' answered the lady in black.

'And you are quite right, madam,' said Dalton. 'Keep on not going—say for the next ten years—and you'll be the only woman in England who has not been there. Then you will become unique, and really valuable to your relatives.'

'Valuable to my relatives!' The hearse-horse absolutely appeared to rear, in her astonishment.

'Well, yes; supposing you didn't mind being exhibited, and money was an object to them—What is that you are saying, Sir Richard, about money? Is it tight or loose just now?'

'Well, Mr Dalton, it is tight, very tight.'

The rest of the company were appalled; the idea of interrupting the flow of the baronet's stertorous eloquence, who was just describing how a gentleman of his acquaintance had died worth half a million sterling, and without a will, seemed to them little less than blasphemous; but the banker knew Dalton by reputation very well, and he dared not answer him as he would have wished.

'I hope you don't find it tight, Sir Richard?'

'I? No, sir,' answered the other with irresistible fury at such a supposition. 'The general public are selling out; but I am not the general public;' and he blew like a grampus.

'Thank Heaven for that!' said Dalton. 'It is a satisfaction, I mean, to reflect,' added he demurely, 'that in these speculative times we have one or two houses at least that can be depended upon, such as yours.'

'You are very obliging,' said Sir Richard icily.

'Water!' repeated her ladyship in the same imperative tones as before, pushing her glass towards Dalton. Again he filled her tumbler, and again she gave no sign of consciousness of his existence.

'She *will* have it, will she?' muttered Dalton between his teeth. 'Then, she *shall*.'

'Don't you mind her,' whispered Mrs Binks consolingly. 'I can see that you are annoyed, but I do assure you it is only her way. She has heard of your misfortune, and she cannot help shewing her sense of the superiority of her position. She is really immensely rich, and we must make allowances.'

'If it is owing to the gin, we must excuse it altogether,' said Dalton; 'the police magistrates always deal leniently with similar cases.' He took no pains to lower his voice; and though Lady Beavor did not catch every word of this reply, she certainly caught the word 'gin,' for her face, which was rather gorgeously decorated with 'beauty-spots' and other superficial ornaments of the same kind, became suddenly one universal red. The fatal monosyllable seemed to echo all round the table; every one stared at one another with a wild surprise, at the introduction of a topic known to be so distasteful to Sir Richard and his lady. She had escaped from gin to be the wife of a banker and a baronet, and any reference to the trade by which she had obtained her wealth was hateful to her, and tabooed by all her friends.

The 'sensation' was so excessive as to put a stop to all calculation—for that was what the conversation had consisted in. 'Silence' may be 'golden' in a general way, but at Mr Dawkins's table silence must have been something else, for speech was golden—since it solely concerned itself with gold. Scarcely any one opened his mouth from that time till long after the dessert was placed upon the table, except to put something into it. Then Lady Beavor turned round to Dalton, and, looking him straight in the face, opened her mouth—to yawn. Genuine female leaders of society, patrons of the Almack's of old days, Dalton knew to have been very rude, even offensively

rude; but this woman's conduct was utterly unparalleled in his experience.

He looked at her with a sweet smile—while she yawned again—and leaning towards her, confidentially remarked, in a tone of sympathy that could be heard all round the table: 'I, too, madam, have a large tooth at the back of my head, stopped with gold.'

If the magnificent but utterly misplaced candelabra which hung from the dining-room ceiling, and filled the room with glare and heat, had fallen plump upon the flowers and fruits, the sensation could hardly have been greater. The ladies rose and left the room in a disorderly manner; the men remained staring at Dalton with resentful alarm, much as a flock of sheep face a strange dog. As for him, he passed the claret, and proceeded to skin a peach during a silence that would have been profound but for Sir Richard's stertorous breathing. Mr Dawkins afterwards said that during that terrible pause—finding it a relief, and almost a necessity to resort to speculation—he laid five to two in his own mind upon the double event of the banker having a fit and his widow marrying again. It was at least five minutes before conversation was resumed, when Dalton finished his peach and rose from the table. He had shewn himself ready to answer for his conduct, but he had no intention of presenting himself, after it, in the drawing-room. Dawkins followed him into the hall.

'Upon my life,' he said, 'I think you were deuced rude to Lady Beecor.'

'My good sir, I only wished her to understand that I was not so utterly penniless as she imagined; that I had a bit of gold in my possession still, and in the same place where she had one herself. I could not be so dull as your friends, but I endeavoured to be as vulgar, and I flatter myself I succeeded.' And with that he lit a cigar, and marched out of the house.

This shocking affair supplied a subject of conversation in capitalist circles for some months, almost to the exclusion of the usual Pactolus stream of talk.

HAPPY ACCIDENTS.

SELDOM do men sit down with a steady resolve, a determined purpose, to discover some new principle or invent some new process. When they do so, there is a lurking idea of the kind of thing they want, a dim perception of the direction in which success may most reasonably be sought. Generally speaking, something is concerned which, for want of a better term, we call 'accident.' An appearance presents itself, or an effect is produced, which the observer neither designed nor expected; an accident, certainly, so far as he is personally concerned. It may be a manifestation, until then unknown, of some natural force or property; or it may be an action of one substance on another, susceptible of useful practical application. This is, briefly expressed, the distinction between a *discovery* and an *invention*. But the important point to notice is, that the value of the accident depends on the kind of man, or kind of mind, by whom or by which it is first observed. If the soil is not sufficiently prepared, the seed will not grow.

Thousands of men had seen light reflected from distant windows, and variations in the light according to the angle of reflection; but a well-prepared mind, on one occasion, suddenly drew from this phenomenon an idea which established the beautiful science of the Polarisation of Light.

It is pleasant to read of the manner in which shrewd minds have turned an accidental observation to practical advantage.

Galileo, being one day in the cathedral at Pisa, watched the oscillations of a lamp suspended from the roof. He observed that the swings or vibrations were all performed in equal times, whether the arc of swing were great or small—whether the lamp had only just begun to oscillate, or had nearly finished. Following up the observation when he returned home, he made temporary pendulums of various lengths, any kind of heavy weight suspended by a string; and he found that the time of oscillation for each pendulum bore a definite ratio to the length of string. Armed with this twofold knowledge, he virtually gave birth to the application of the pendulum as a regulator of clocks—an invention to which the precision of modern astronomy owes so much.

What to say of Sir Isaac Newton and the apple, we scarcely know. Some biographers pass by the incident without notice; some express a doubt of its truth; while others see no reason why an acute mind, trained to mathematical thought, should not draw a valuable conclusion from the incident observed. The story runs thus, in the words of Pemberton, the contemporary and friend of the illustrious philosopher: 'One day, as he was sitting under an apple-tree at Woolsthorpe, an apple fell before him. This incident, awakening in his mind the ideas of uniform and accelerated motions, which he had been employing in his method of fluxions, induced him to reflect on the nature of that remarkable power which urges all bodies to the centre of the earth. . . . "Why," he asked himself, "may not this power extend to the moon; and then what more would be necessary to retain her in her orbit about the earth?" This was but a conjecture; and yet what boldness of thought did it not require to form and deduce it from so trifling an accident!'

The reflecting apparatus for lighthouses arose out of a wager, if the facts are correctly recorded. Somewhat more than a century ago, among the members of a small scientific society in Liverpool, one offered to wager that he would read the small print of a newspaper by the light of a farthing candle placed ten yards or thirty feet distant. The wager being accepted, he coated the inside of a wooden board with pieces of looking-glass, forming a rough substitute for a concave mirror; placing a small lighted candle in front of this mirror, the rays of light were reflected, and converged to a focus ten yards on the other side of the candle, and the light at that focus was sufficient to enable the experimenter to read a newspaper. Of course the distance of the candle from the mirror was made dependent on the curvature of the mirror itself. An observant practical man, dockmaster of Liverpool, was present. The idea flashed upon him, that if the light of a farthing candle could in this way be thrown out to a distance, the light of a large lamp could similarly be projected to a mile or miles away. The idea

grew into form, and resulted in the invention of the reflecting lighthouse, or rather the reflecting apparatus for lighthouses.

One day, Lundyfoot, a snuff manufacturer, was drying some snuff, a necessary process in its preparation. Through a little neglect, the snuff was allowed to be overheated, till it became charred, scorched, or burned. In the view of a prosy jog-trot tradesman, the commodity would have been thrown away as spoiled; but this manufacturer, noticing the pungent character of the snuff, and how it tickled the nose, and knowing that some men like to have the nose tickled more than others, resolved to try whether 'high-dried snuff' could be brought into favour. It not only did so, but proved a source of wealth to him. Any man may burn a commodity by carelessness; it is the observant man who ingeniously turns the accident to a good account.

The writer has seen a piece of printed calico or muslin that exemplified the way in which an accident led, not exactly to an invention permanently useful and profitable, but to a pattern that had a great success in one particular year. A piece of cotton being printed at one of the great Manchester establishments, became a little displaced. While travelling upwards from the printing cylinder, a portion of the cloth shifted into some disarrangement, and was printed a second time, but in a different direction from the first. The effect was very singular. The original pattern was a simple one; but the diagonal repetition produced a forked-lightning effect of a kind which a designer would not have been likely to hit upon. The master-printer took a hint from the accident; he suggested the engraving of a design in which the forked-lightning effect should be utilised. It proved to be one of the most successful patterns ever introduced by the firm. The reader may form some idea of the way in which this fortunate mishap occurred; for one corner of a newspaper sometimes accidentally gets printed a second time, but at a different angle. A muddle it makes when the impress consists of words and sentences; but when it consists of geometrical lines or fancy arabesques, the product may be a fortunate one to a man who has his wits about him.

One of the producing causes of prosperity of the Staffordshire pottery manufacture was the discovery of a cheap durable glaze, applicable alike to brown ware and white ware, and greatly increasing their usefulness by making the surface impervious to water. The discovery, according to Shaw, the historian of that county, was due purely to accident. At Stanley Farm, situated a few miles from Burslem (now the very centre of the Potteries district), a maid-servant was one day heating a strong solution of common salt, to be used in curing pork. During her temporary absence from the kitchen, the liquid boiled over. Being in an unglazed earthen vessel, the solution, spreading over the outside, produced a chemical action which she little understood, and which did not compensate her for the scolding she received. Some of the elements of the liquid combined with some of those of the highly heated brown clay surface to produce a vitreous coating or enamel, which did not peel off when the vessel was cold. The humble brown-ware vessel acquired historical celebrity. A Burslem potter, learning what had taken place,

saw that glazed ware might possibly hit the taste of the public; he introduced the system of glazing by means of common salt, a system at once cheap, easy, and durable; and England has made many a million sterling by the discovery.

One of the pleasantest anecdotes illustrative of an invention being suggested by accident, bears relation to the stocking-loom or knitting-frame. The story has been told in two or three different forms; but the most popular version accords with a picture and inscription preserved by the Framework Knitters' Company. About a hundred and ninety years ago, Mr William Lee, of St John's College, Cambridge, was expelled for marrying in disregard of the statutes of his college. Having no fortune on either side, his young wife contributed to their joint support by knitting. The husband, watching one day the movements of her fingers, suddenly conceived the idea of imitating them by mechanical means, in order that she might get through her work in a manner easier to herself, and perchance increase her emoluments. The ingenious stocking-frame was the result of his cogitations. In hand-knitting, polished steel needles or wires are used to link threads together into a series of loops, closely resembling those produced in tambouring. In framework-knitting, one person can manage a large number of knitting-needles at once—pieces of steel midway in shape between straight wires and bent hooks, and aided by jacks or vibrating levers, treadles, rows of bobbins, and other clever contrivances. William Lee's first stocking-frame was in all probability small and very rough; but it had in it a potentiality (as Dr Johnson might have called it) of developing great things, until at last it has culminated in that masterly piece of mechanism, the circular rotary hosiery machine.

Lucky accident, in like manner, led, about the year 1764, to the invention of the spinning-jeany, one of the foundations of the amazing prosperity of the cotton manufacture. But as in most instances of the kind, the soil was prepared in some degree for the reception of the seed, the accident would probably have passed unnoticed if there had not been a mind in a condition to appreciate it. James Hargreaves, of Standhill, near Blackburn, was a humble man who lived by hand-spinning and weaving, his wife and children aiding in their several ways. He succeeded in expediting his work by inventing a carding-machine to comb out or straighten the fibres of cotton, as a substitute for hand-cards (wires inserted in a flat piece of wood). In spinning, after the carding and other preparatory processes had been completed, he frequently tried to spin with two or three spindles at once, by holding two or three separate threads between the fingers of his left hand, and thus double or treble the amount of work effected in a given time. The horizontal position of the spindles, however, baffled him; his fingers and the spindles would not work in harmony. One day, in 1764, a little toddling member of his family upset the spinning-wheel while it was being worked. Hargreaves noticed that, while he retained the thread in his hand, the wheel continued to revolve for a time horizontally, giving a vertical rotation to the spindle. An idea started into his brain at once; here was the very thing he wanted. He saw that if something were contrived to hold the roving (a thickish coil of cotton) as the finger and thumb

were wont to do, and to travel backward and forward on wheels, several spindles might be used at once. He set to work; and the result was a frame or machine which he called the spinning-jenny (very likely his wife's Christian name was Jenny), having eight spindles. The family at once largely increased their weekly earnings. How it happened that through workmen's spite and manufacturers' greed, or whether it was, as has been said, that a better idea than his had been previously started and acted upon by others, Hargreaves was never permitted to secure an adequate return for his ingenuity, we need not now stop to relate; Lancashire accumulated wealth from the spinning-jenny (amplified by degrees to eighty spindles), but regarded little the brains that had enabled them to do so.

When maidens are 'doing their hair,' an important element of daily duty in many a household, they may perhaps be gratified in learning that this process led accidentally to a very useful invention. Joshua Heilman, engaged in the cotton manufacture at Mulhouse, in Alsace, was long meditating on the possibility of inventing a combing-machine for long-staple cotton, the carding-machine until then employed being better suited for cotton having a short staple. He tried, and tried again, and impoverished himself by preparing machines and models which failed to realise the intended purpose. Brooding over the matter one evening, he watched his daughters combing their hair, and noticed (perhaps for the first time *really* noticed) how they drew the long tresses between their fingers, alternately with drawing the comb through them. The thought struck him, that if he could successfully imitate by a machine this twofold action, so as to comb out the long fibres of cotton, and drive back the shorter by reversing the action of the comb, his long-sought object would be pretty nearly attained. Armed with this new idea, he set to work with renewed cheerfulness, and invented a beautiful machine, which enabled him to comb cheap cotton into moderately fine yarn, more easily and with less waste than by any process until then known. One of our Royal Academicians, about a dozen years ago, brought the skill of his pencil to bear upon this pleasant subject for a picture—Heilman watching his daughters combing out their glossy tresses.

Hostlers, horsey men by occupation, know but little beyond horsey subjects. One of the fraternity, however, was unconsciously the means of suggesting an idea which brought highly profitable results—not, it is true, to himself, but to an important manufacturing district. In 1720, a potter named Astbury was journeying on horseback from Staffordshire to London. Stopping awhile at Dunstable, he obtained assistance in regard to a weakness in the eyes of his horse. The hostler at the inn, making use of such bits of veterinary knowledge as he possessed, took a piece of flint, calcined it in the fire, pulverised it, and blew some of the powder into the horse's eyes. The change produced in the flint by burning, from a black stone to a white powder, struck Astbury with a new idea. Would it be possible to produce white flint ware, harder and more durable than white ware made wholly of clay? He collected a small stock of flints from the chalk hills of Dunstable, and took them back with him to Staffordshire. The result more than realised his

expectations; powder of calcined flint, mixed with pipe-clay, produced a most excellent ware, and established a new branch of the potter's art that took firm root in Staffordshire.

AN ELECTION STORY.

IN TWO CHAPTERS.—CHAP. II.

WITH a violent effort Lady Waring released herself, and again went hastily towards the door. Whether her husband would have struck her, cannot be said; he was almost beside himself with passion at her persistent defiance, and was following with arm upraised, and a savage look in his eyes, when another member of his committee was heard blundly inquiring for him in the passage. Checking himself, he tried to smother down his anger—for a time, while Lady Waring escaped, and hurried to her own private sitting-room. Sir Harry found, much to his annoyance, that he was expected to dine with the chairman of his committee (whose entrance it was had interrupted the scene between Lady Waring and himself), to meet a local orator who had promised to speak at the meeting; and after dining, they would proceed together to the town-hall, where the committee and other prominent members of the party would be assembled, ready to accompany Sir Harry to the platform. He could not well refuse the invitation; so, after having charged Lady Waring's maid to impress upon her mistress the necessity of punctuality at the meeting, and ordered the carriage to be brought to the door for her in good time, he left the hotel with his friend.

Sir Harry tried to persuade himself that his wife would go after all, yet, knowing her high spirit, he still felt great doubt and anxiety on the subject. But he hoped for the best; for her own sake, Agnes would hardly defy him so utterly, when she thought the matter over quietly.

Meanwhile, Lady Waring paced up and down her room, thinking over all that had been said and done in this last most serious quarrel between her husband and herself. She had been hectored and insulted—he had almost struck her; he had actually bruised her in his brutal grasp—and as she looked at the dark, disfiguring mark on her arm, her longing for revenge increased. But for the personal degradation, she would have liked to have shewn that bruise to the mob which raised cheer after cheer around the hotel for Sir Harry Waring. She would leave him—but she would punish him first, and so that he should never forget it. For a long time she adhered to her resolution of not attending the meeting, and smiled to herself as she pictured his rage at her non-appearance; but suddenly a new thought entered her mind, a thought which brought the bright flush to her cheeks, and a look of daring and determination in her eyes. She sat down for some moments, thinking deeply. Then she rose and opened her escritoire, and hastily penned a short note, which was sent at once to the proprietor of a large drapery establishment in the town (much to the astonishment of her maid, as her wardrobe was well supplied, and the costume with which she had intended to dazzle the

eyes of the Westdown electors had already been decided upon); and afterwards wrote two brief letters, which she ordered to be posted immediately, and a longer one, which she sealed, and put apart by itself. Before long, a 'young person' arrived from the draper's, accompanied by a porter carrying a large parcel. This parcel was conveyed to Lady Waring's own room; and having dismissed her maid, she and the 'young person' had a long and mysterious consultation together, from which the latter retired at length with a very puzzled expression of face. Then Lady Waring gave her maid an order to pack one of her mistress's large trunks with such dresses, linen, and other necessities of apparel as would be required for a short visit and also to pack her own box, and to lock and cord them ready for a journey.

'Are you going to send the luggage on before, my lady?' she at last ventured to ask, thinking her mistress might leave Westdown directly the election was decided; but Lady Waring coldly replied in the negative. When she had had some slight refreshment in her room, it was time for her to dress for the meeting. Her toilet did not take so long as usual, and the carriage in which she was to proceed to the hall (where she was to meet a party of sympathising lady-friends, who were to occupy the orchestra with her), was not kept waiting.

When she swept from the room with graceful stately tread, the people of the hotel, who were as usual clustered in the hall to see her enter the carriage, did not utter their customary murmur of approbation; on the contrary, they shrank back in silent amazement as she passed by, with one of her slight dignified bows to the landlord; and her maid, when she returned from settling her lady comfortably in the carriage, looked scared and startled as she joined in the buzz of conversation which greeted her.

The meeting at the town-hall had begun. The room was densely crowded, and there was scarcely a person present who did not wear a yellow flower or favour. The chairman, a gallant white-haired old gentleman, had in his courtesy delayed commencing as long as possible, so that Lady Waring should grace the proceedings, before he rose to deliver his opening speech. But the increasing murmur of the crowd, a few impatient calls of 'Time!' and then a unanimous trampling of the feet, had decided him upon beginning in her absence. Sir Harry sat at the front of the platform, surrounded by his partisans, attempting to look bland and confident as a parliamentary candidate should, but in reality in a state of nervous terror, lest his wife should carry out her threat of being absent; and as he thought of the extreme probability of her doing so, he vowed mentally to conquer her stubborn spirit yet. Both he and his supporters cast anxious looks towards the gallery; and many in the crowd noticed Sir Harry's extreme pallor, but attributed it to his energetic and fatiguing canvass. At last, when the chairman's flow of platitudes was drawing to an end, and Sir Harry was about to rise to deliver, with all the eloquence at his command, his final address, there was a faint stir and rustle among the few ladies already assembled in the orchestra; and then a banging of doors was heard, and a slight disturbance, which announced to the meeting that Lady Waring had come at last.

Every eye in the room was strained to have a full view of the candidate's beautiful wife, every hand was ready for a thundering round of applause with which to greet her, every voice was ready to utter the deafening cheer of welcome as she entered; and Sir Harry for the first time that evening breathed freely. He had conquered, then! That was as it should be. The door of the orchestra opened, and Lady Waring entered, and without any recognition of those around her, walked with a firm step to the front of the gallery, where she stood for some moments, looking intently at the crowd below, her handsome features pale and still, yet with a half-smile on her lips. Her tall form rose as high above the ladies near as her beauty surpassed theirs. She stood, the embodiment of perfect grace, a picture of loveliness never to be forgotten by those who beheld it. But not a cheer was raised, and save for a slight buzz of whispering which arose as all gazed at the candidate's wife, the vast assembly was silent; and Sir Harry sank back into his chair speechless with passion and amazement. For Lady Waring was dressed in *blue*!

The silence lasted but a few moments, and then arose a confused sound of exclamations of astonishment, cries of 'Order!' and expostulations from the chairman, mingled with a storm of hisses and groans. Some of the committee whispered to Sir Harry in hurried tones, and he left the platform, and tried to force his way through the crowd to the door, followed by some of the more intimate of his adherents.

During this time, Lady Waring had been standing in the same place, unmoved by the uproar, or the entreaties of one or two of the ladies around, who begged her to leave the hall; but when she perceived that Sir Harry had left his seat, she bent gravely to the people who were clamouring below, and then hurried from the gallery. A perfect babel of sound arose when she had disappeared. The crowd having recovered from its first feeling of overwhelming astonishment, had become furious at the insult given them; and there was a general rush towards the doors, some of the rougher townsmen having a wild desire to intercept Lady Waring before she could leave the building, and tear the obnoxious-coloured dress she wore into strips. But she had been too quick for them, and had eluded both her husband's vigilance and theirs. She had hastened through the passages and lobby, and entering a conveyance which she had appointed to wait for her at the side entrance, had driven direct to her hotel. There she took up her startled maid and the boxes which had been packed in the afternoon, and drove without further delay to the station; and in less than a quarter of an hour was whirling through the darkness in a fast up-train to a country town not far from London. There she spent the night at a small, stuffy *Railway Hotel*, and the next morning took refuge with a favourite maiden aunt of whom Sir Harry knew but little—who lived a mile or two from the town, and who had been prepared to expect her by the letter she had sent the previous day. She preferred to make this her retreat, rather than seek a shelter in her mother's house, as she well knew she could only expect a cold reception and severe blame from Lady Aslington. Besides, her husband was more likely to seek her

at Kingsdene than anywhere else, and she was sufficiently in dread of him to desire that he should not discover her whereabouts, until time had passed.

There was great excitement in Westdown after the meeting had broken up the night before, and the exaggerations and false rumours which were taken as true, were multitudinous. Sir Harry, though certainly entitled to pity, received but very little of it from the inhabitants of the town. Public opinion set steadily against him. There were very few men or women in Westdown who did not believe that he had brutally ill-treated his wife, and that his conduct had driven her to do what she had done; no one could know what she had undergone; every one said his temper was fearful; jealousy might be at the bottom of it; ah! he was a thoroughly bad man: it was a plucky thing for a woman to do, after all, and it served him right. Then the probable consequences were discussed. Would they ever be reconciled, or would they separate? Was she gone to her mother's—or where? Would her relatives receive her? Had she gone off with any one, to spite Sir Harry, and what would he do if he found her? And so the gossips talked on until it became so late that the excited groups were compelled to disperse and retire to their homes.

When Sir Harry, finding his wife had left the town-hall, returned to the hotel only to discover that she had escaped him there also, his fury was ungovernable; nor was it diminished when he found on her dressing-table a note addressed to himself—a note so stinging in its concise sarcastic diction, that it seemed to madden him, and in his rage he tore the offending missive to atoms, scattering the pieces far and wide. He was undecided for some time how to act. The note had told him that the place in which she had taken refuge should never be known to him; but in spite of this he at first believed she had gone to her mother, to whom, and to other of his wife's relatives, he sent furious telegrams. But he soon abandoned that idea, bethinking himself how improbable it was she would fly from him to the place in which he was most likely to seek her. One of his friends made inquiries at the station as to the place for which Lady Waring had taken a ticket, but with no result—for her maid had taken the tickets, and she herself had not been noticed in the darkness. Sir Harry paced up and down the room in an almost frantic state, with such a lowering look upon his face, that one by-stander whispered to a friend: 'It's lucky her ladyship's off, or there'd have been murder done!' And indeed it was fortunate that Sir Harry was in total ignorance of his wife's retreat, for, had he known it, some terrible crime might have been committed, which would have cast a dark shadow over the rest of his life. At last, being almost worn out—strong and stalwart as he was—with fatigue and mental excitement, he listened to those of his friends who advised him to remain quietly at the hotel that night, and in calmer moments on the morrow, consider what should be his course of action.

With the morning came his agent and the prominent members of the party, eager to learn how he intended to act with regard to the now imminent election. A section of the latter expressed surprise that he had not decided to withdraw from the candidature already. Others,

however, still thought, he might have a chance of gaining the seat, though with a diminished majority; and talked valorously of 'fighting to the end,' and winning by 'sheer pluck.' And Sir Harry, bent on defeating his wife's scheme against his success, resolved to go on with the election, if but to mortify and disappoint her; nor could any advice or entreaties shake his determination; and before noon it was known all over Westdown that he had not retired from the contest. His courage in continuing the struggle in spite of what had occurred, regained to him some of the votes forfeited by his supposed cruelty to his wife. But Westdown, as a whole, was against him; he was hooted in the streets, and pointedly cut by many who had before been his devoted partisans. Later in the day, his brother and one of the Affington family—a cousin of his wife—came to the town; the latter to express his deep regret at what had taken place, and on Lady Affington's behalf to inquire into the matter.

Lady Waring had told her mother little more in the letter she had written to her the previous day, than that she had had a violent quarrel with her husband, and was about to leave him; and that by the time the letter reached her, she would be safe with a relative; and she added, if her mother guessed with whom she was staying, she was on no account to give any clue to her husband or any of his family. The first intelligence of all her daughter had done was conveyed to the countess in the telegrams Sir Harry had sent; and she, whilst blaming Agnes for the notoriety and disgrace she had inflicted on herself and those related to her, felt sure the provocation must have been great to cause such an act, and she therefore sent her nephew to Westdown to discover the truth. She had little doubt that her daughter was with her aunt, but kept her surmises on that subject to herself; and intended to do so until her son-in-law's wrath had a little subsided, and there was a chance of some amicable arrangement between the parties. But Sir Harry would answer no inquiries, listen to no advice, and spoke in such a manner of his wife, that the chivalrous young champion refused to listen to such language about his cousin—culpable as she undoubtedly was—and finally left the hotel in dudgeon.

After his departure, Mr Waring attempted to persuade his brother to retire from the contest and leave Westdown at once, but without effect. Sir Harry was inflexible, and determined to go on to the end. The day of the election dawned, and it was easy to see from the first which had become the popular candidate. No one was surprised, therefore, when the state of the poll was declared, and the Hon. George Wynne was found to be member for Westdown by a majority of nearly two hundred.

Although Sir Harry had been greatly to blame in his conduct towards his wife, he was to be pitied as he returned to his hotel smarting under his defeat. Lady Waring had had her revenge as she desired, and a terribly bitter one it was to him. He felt in his present excited state that he could not face the contemptuous looks or hostile glances of the towns-people the next day; so, leaving his agent to settle everything connected with the election, he and his brother started for London by the mail-train that night.

In his overwhelming anxiety to leave the scene

of his recent mortification, he had forgotten how speedily news travels in these days. By the time he was breakfasting at his brother's chambers, the story of his defeat and its cause was being discussed by thousands of newspaper readers throughout the country. Had he been in London the day before, he would have seen such announcements as 'Extraordinary Scene at a Public Meeting,' 'Sensational Scene at Westdown,' 'Singular Conduct of a Candidate's Wife,' &c. on the newspaper bills. One daily paper had contained a stirring leader on the subject, and the quarrel between Sir Harry and Lady Waring was freely commented on by all classes. Considering the excitement, political and passionate, that he had undergone during the last few days, and added to this, his dread of pity or silent blame from friends and relatives, and considering, too, how dear the applause and envy of the world were to him, it is no wonder that his strength and nerve suddenly gave way, and that before many hours passed, Sir Harry was lying dangerously ill of brain-fever. For many weary days and nights his ravings shewed how vehement was his desire to be revenged on his wife; and he would attempt to spring from his bed and force his way from the room, having some confused idea of pursuing her, and striking her down with his wasted, trembling arm. The unfortunate man was kindly and carefully watched and tended by his brother and a nurse.

Lady Waring meanwhile still remained with the kind relative who had received her after her flight, and who, though a 'maiden aunt,' was far more 'motherly' towards her than Lady Affington had ever been. While she blamed her niece with gentle severity for her readiness in perceiving offence, and her tardiness in forgiving it; and for that last irrevocable act, which had separated her from home-happiness for the future, and divided her from her husband, if not from her other relatives, for the rest of her life—she still shewed genuine regard for her in a thousand ways, and soothed, advised, and softened her as no one else could have done. Lady Waring suffered keenly; yet she was still too proud to express even to her aunt what she felt; and far less could she do so to her husband. Knowing his nature—so like her own—she felt how utterly impossible it was that any reconciliation could take place between them. Lady Affington went to her before long, but it was an unsatisfactory interview. The mother's conventional horror at her conduct only checked her newly experienced feeling of remorse; and a coldness arose on both sides, so that, by tacit agreement, there was but little after-intercourse between them.

Lady Waring did not hear of her husband's illness till its worst phase was past. Even had Mr Waring known the place of her retreat, it would have been worse than useless to bring her to her husband's sick-room. Those around him knew how far he was from forgiving her. She remained with her aunt near London till her husband had partially regained his health; when a formal separation, on the ground of 'incompatibility of temper,' having taken place between them, she, with her aunt and maid, went to a quiet Devonshire watering-place to spend a few months in pleasant retirement; and Sir Harry, with his brother and a few friends, set out for a lengthened tour on the continent. Whether he and

his wife will ever meet again in this world, cannot be said; but let the story point a moral for those wives and husbands whose lives are rendered miserable from excess of pride and a *lack of mutual forbearance*.

THE MONTH: SCIENCE AND ARTS.

THE opening by the Queen, of the Exhibition of Scientific Apparatus at South Kensington, may perhaps be taken as a sign that science will have more consideration in high places than it has had until quite recently. Whether the change will be for the advantage of science or not, remains to be seen. Meanwhile, the Exhibition is a surprise to scientific visitors, as much by the quality as by the prodigious quantity of articles there brought together. A large portion has been lent by foreign countries; and many foreigners eminent in science have visited London, some of them with instruction to draw up Reports on what they have seen. In this way the world at large will profit by the Kensington Exhibition.

It has long been known that the Commissioners of the Great Exhibition of 1851 have a large surplus remaining from the profits of that memorable undertaking. It is now rumoured that being desirous to discharge themselves of their responsibility, they are about to expend the money in the promotion of science. An astronomical observatory and a large library, both at South Kensington, are to be included in their scheme.

Speaking of exhibitions, of another kind is the annual show of pictures at the Royal Academy, and at the minor institutions which live on art. What becomes of all the rejected pictures? They are thousands in number every year. And for people who enjoy excitement at a distance, there are the Centennial Exhibition at Philadelphia, the prospect of a Grand International Exhibition at Paris in 1878, and the meeting of the Congress of Orientalists at St Petersburg in September next. The questions to be discussed by this learned assemblage will, of course, be ethnographical and philological: we select three from the published list, as specimens—Historical monuments teach us that during more than two thousand years, Siberia poured forth people after people upon Central Asia: what were the circumstances that led to that excess of population, and why did that excess and the emigrations cease with the conquest of Siberia by the Russians?—Is it possible, from the numerous Elamite proper names which have come down to us, to draw any decisive conclusions as regards the nationality of the Elamites?—To what extent do the mutual relations of the Arab tribes before Mohammed, serve to throw light on the political condition of the Israelite tribes of the time of the Judges?

With all this, which savours of peace, we hear of bigger and bigger war-ships, each excelling the other in destructive capabilities; and of torpedoes that swim under water at the rate of twenty miles

an hour for the purpose of sinking ships; and of guns so powerful that a single one is equivalent to a whole broadside of the good old times.

Mr Crookes and his radiometers with their remarkable movements continue to engage the attention of scientific men throughout Europe. Professor Wartinann of Geneva, in a series of experiments, has discovered that the motion of the vanes of the little mill can be made to spin direct or inverse at pleasure, or can be entirely neutralised. In the latter case, the rays of two lamps at unequal distances are concentrated on the vanes, and it is by the difference of distance that the effect is produced. From the general result of his experiments, Professor Wartinann is led to agree with Professor Osborne Reynolds of Owens College, Manchester, that the movement of the whirligig is occasioned by the dilatation of gas (or air) under very low pressure, and that radiation has nothing to do with it. It is impossible to produce a *perfect vacuum*. There is always a small quantity of air left in the glass apparatus in which the whirligig spins; and the warmth from the light placed near the glass affects this residual air, and occasions the rotation. Professor Challis of Cambridge, in accounting for the phenomenon, says, there is 'a decrement of *ethereal density* from the dark towards the bright surface (of the vane), and the atoms, being immersed in this variation of density, will be urged as if the vane were pushed on the black surface.' With these explanations in mind, Mr Crookes and other experimentalists will now be able to proceed on new lines of discovery.

The printing of weather Reports, gradually adopted by all the countries of Europe, is now taken up by Denmark. The Report published by that country is particularly interesting, inasmuch as it includes tables and returns from the Faroe Isles, from Iceland, and from four stations in Greenland, one of them being Upernavik, the most northerly station in the world.

At the beginning of the present year, the druggists of Austria were ordered by the government to adopt the decimal system in their weights and measures. To facilitate the change, a table of equivalents in the old and the new system has been published, with special instructions for the prevention of mistakes. The gramme is the unit of weight. The numbers must be expressed in Arabic numerals: thus, 0.05 is to represent 5 centigrammes; and 2.50, two and a half grammes. Decagramme, 10 grammes, and decigramme (one-tenth of a gramme) are so similar in appearance, that they are not to be used; but 5 decagrammes are to be expressed by 50 grammes; and 5 decigrammes by 50 centigrammes.

At a meeting of the Entomological Society, nests of living trap-door spiders were exhibited which had been brought from Uitenhage, Cape Colony. Usually the nests are built in the earth; but in this instance they had been contrived in cavities in the bark of trees, with a small piece of bark as trap-door. By this arrangement, dis-

covery of the nest was almost impossible when the door was shut.

At the same meeting, Mr Riley, State entomologist of Missouri, United States, gave an account of the ravages of the Rocky Mountain locust over large areas of the north-west territory. Fears prevailed of an invasion of the settled districts; but Mr Riley, knowing something of the habits of the destructive insect, and that it could not exist in a moist climate, predicted that the devastation would not overpass a certain line; and found his prediction verified. He noticed that pigs and poultry grew fat on the invaders, and recommended the inhabitants of the distressed districts to eat locusts. A banquet was organised in St Louis, at which locusts cooked in various ways were eaten; and were pronounced excellent, especially when made into soup. It would seem like poetical justice that the destroyers should be eaten in the land where they had devoured every green thing.

Last year, Switzerland was afflicted by swarms of locusts; and a learned professor who surveyed the scene of their devastations recommended the government to use all available means to destroy the young which are deposited in the ground, and if left undisturbed, come forth with voracious appetite in the following summer. Spain, as we learn by recent advices, is suffering from a visitation of the devourers in some of the southern provinces, and there, in like manner, the eggs are hatched in the earth, and with marvellous quickness. It is said that if a packet of the eggs be carried in a man's pocket, the heat of his body will hatch them in twelve hours. The Spanish government has sent soldiers into the threatened districts with orders to dig and destroy. They must be active, for the numbers of the enemy are almost incredible. It is on record that two years ago a train was stopped by masses of locusts piled up, like driven snow, along the railway. A Frenchman has discovered that pounded locusts squeezed up into round lumps are an attractive bait for fish.

As a contrast to a picture of destruction, comes the information that the cultivation of the vine has succeeded so well in California, that the grape-crop is expected soon to rival the wheat-crop in importance. Narrow-gauge railways have been constructed, by which the 'vineyardists' in outlying places bring their grapes down to market. Large numbers of vine-cuttings were imported from Europe, and the best of them are now cultivated for wine or raisins, and port, sherry, and champagne are successfully produced. From 1871 to 1875, the quantity exported from the state, by land and sea, amounted to nearly five million gallons. It is a recommendation for Californian wines that they do not suffer from a sea-voyage.

The Duke of Manchester has tried experiments on his estate at Kimbolton, which are well worth consideration by all concerned in the breeding of live-stock. Desiring to convert arable land into pasture, he did not sow grass-seeds, but with a machine, made by Messrs Howard of Bedford, he cut ropes of sod two inches wide out of an old pasture. These ropes were carted to the field that was to be converted, were broken into pieces about two inches square, and were then placed in regular rows on the surface of the ground by women and children, who gave each piece a slight squeeze with their foot after laying it. The rows

are marked by the coulters of an empty corn-drill drawn over the land; and after the inoculation is finished, the field may be rolled whenever necessary. It was in November 1873 that the first field was thus treated. By the following autumn, it was completely covered with grass, and 'was nearly as level and good as old grass-land;' and in the second year was 'fit for grazing.' And as regards the pasture from which the ropes had been cut, we are told that 'after the first year the gaps in the turf were scarcely perceptible.'

Thus the tendency of grass to spread and fill up bare places, has been turned to profitable account. The subject is not new, nor is this the first time that it has been mentioned in these pages; but the making use of such small pieces of soil to inoculate the land is new. The cost is about three pounds an acre, which, as we are informed, is less than the cost of sowing with grass-seeds; and 'there is no falling-off experienced in the third, fourth, or fifth year, at least to the same extent as when land is laid down to pasture with artificial grasses.'

The plain of Gennevilliers, near Paris, had been from time immemorial a barren, sandy waste. Within the past few years a portion of the sewage of Paris has been discharged on that plain, and it now presents a scene of extraordinary fertility, comprising fruit, flowers, and vegetables in abundance. The best cultivators dig and lay out the land in beds two feet six inches in width, divided one from the other by channels of the same width. Through these channels the liquid sewage flows. Immediately after each crop is taken off, the bed is shifted to the channel, and the place of the bed becomes a channel. By this arrangement, the growing plants are always kept from actual contact with the sewage. What can be accomplished under this system may be judged of from the amount of produce per acre: for example—carrots, twenty tons; red beetroots for salad, thirty-five tons; French beans, six tons; cabbages, thirty tons; spinach, four tons; artichokes, about forty thousand heads. Five acres of land produced thirty-one tons of mint, worth two hundred pounds. A farmer who took some of the same land, grew fifty tons of 'mangolds,' thirty-two bushels of wheat, and fifty-six bushels of oats, to the acre. These are facts deserving of attention. The *Journal of the Royal Agricultural Society*, Part I. for the present year, contains full particulars of this subject and of the method of producing pasture by inoculation.

The progress of the cinchona plantations in India has been such that, as we learn from a paper read to the Society of Arts by Mr Markham, they now yield one hundred and forty thousand pounds of bark a year, with a tendency to increase. The advantage of cultivation over the crop of wild bark formerly collected on the slopes of the Andes, is, therefore, most strikingly demonstrated; and Mr Markham now advocates a similar experiment with the caoutchouc or india-rubber tree. The demand for india-rubber increases every year, and the supply—a wild one—diminishes. It is to be hoped, therefore, that the measures already taken to establish plantations of caoutchouc in the hot and moist hill-districts of India, will be persevered with until a sufficient quantity shall be grown, and the quality improved. The best kind of caoutchouc grows in South America.

A good thing has been done in India, by the holding of a conference of the functionaries in charge of the forests under the Inspector-general, Dr Brandis, F.R.S. The subjects discussed went over a wide range, from the best means of preventing forest-fires to the best and most profitable method of tree-culture; and in a country with such extremes and diversities of climate as India, the experience and observation of the officers would be very diverse, and would heighten the interest of their conference. The best method of planting in the hill-districts would not be the best method in the plains, and the discussion of the several methods would be instructive. Forest reserves, and the planting of waste lands, were strongly advocated; and the general result of the conference may be regarded as favourable to the art of forestry and the science of botany. The proceedings are to be printed, and circulated wherever interest in the subject is manifested.

There are prodigious quantities of coal in China, but not one coal-mine. An attempt is, however, about to be made to work the coal on proper principles, as the Chinese government have arranged for the purchase in England of the necessary 'plant,' which is to be employed in a district about forty miles to the west of Peking. Should coal-mining prove successful, it will in all probability lead to the smelting of the iron ore, of which China has also prodigious quantities.

The preparation known as 'negative gun-cotton,' used by photographers and others for the production of collodion, is soluble in an alcoholic solution of camphor. This fact led to the mixing of gun-cotton and camphor as an experiment, and the result appeared in the form of artificial ivory. But this result was not arrived at without the exercise of tremendous pressure; and now by the aid of hydraulic pressure, artificial ivory is every day produced, and manufactured into various articles. In some instances, especially billiard balls, the artificial is better than the real ivory. Recently, at a meeting in New York, Professor Seely mentioned that he had placed a few particles of camphor in a test-tube which was plugged with gun-cotton. The tube was set in a bath of hot water to test the effect of camphor vapour; but in a few minutes the tube appeared full of red mist, and the cotton exploded. Had the quantity been larger, there would have been danger in the experiment; and the conclusion is, that the manufacture of the artificial ivory may not be free from risk, and that increase of temperature during the process should be guarded against.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notices:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

GETTING ON.

AMONG the crowds moving along a busy thoroughfare, there is observably a difference in the rate of progress. Some who are out for amusement loiter at the more attractive shop-windows, and make a kind of holiday on the occasion. Some stand still and gossip with casual acquaintances whom they chance to meet, and are an impediment to the more eager pedestrians. A certain number push right on, as if caring for nothing but the object in hand, which is to reach their destination in the least possible time. To be sure, they could hurry over the ground by taking a cab, or trusting to an omnibus, but in either case some money would be expended, and for the sake of economy, unless the distance be very great, they trust to their legs and power of endurance.

Is not that a microcosm of the world? There is a general hurrying on with some special object in view; but amidst this conspicuous haste there are clusters of individuals who, despite the pressure of circumstances and obligations, loiter on the way with complacent indifference, make life a piece of amusement, spend means and time idly, and in old age find themselves drifted high and dry into conditions that are absolutely pitiable, but for which they have themselves alone to blame. One cannot eat his bannock and have it. That is a commonplace but solemn truth. An old proverbial philosophy taught us as much. Nor was it ever until now hinted that there was anything wrong in the more pushing and economical getting ahead of the lazy, the loitering, and the indifferent. The new doctrine propounded, we regret to say, by a minister of state, amounts to this: that in the general struggle of life, one has no right to use his best endeavours to surpass his fellows. Or, to revert to our simile, the more active pedestrians in the street are, as an act of justice and propriety, not to outdo the feeble or sluggish, who prefer to take things easily, without a thought as to the probable consequence of their lethargic movements. In short, all must go

at a decorous funeral pace - no one is on any account to strive to get before another.

Such is the new philosophy that was recently set forth in an address to an assembly of students at Edinburgh by the Earl of Derby on the object to which studies should be directed. His lordship does not object to a wholesome emulation, but, somewhat contradictorily, is opposed to any one trying to do his best in the rivalry of his fellows. 'I am not blind,' he says, 'to the advantages which a state gains by the existence among its citizens of a strong feeling of social emulation; but personally I am not a believer in what has been called the "gospel of getting on." It is, for one thing, a gospel which can only be preached to a small minority. To be successful in the world's sense means to have got over your neighbours' heads; to be rich, as the word is used, means to be richer than your neighbour; and by the very nature of the case, these are results which, if everybody aims at them, involve failure and disappointment to nine out of ten. We all start in life with the notion of beating our equals in the race; it is a useful stimulus at the outset of a career; but I think I have noticed that as they go on in life, most men who are worth their salt think more and more of doing their work as it ought to be done, and less of the return in fame or gratified vanity which it is likely to bring them. College successes no doubt give a good start in life, and are a useful preparation for that keen professional competition which, whether we like it or not, is inevitable in most employments. I do not, assuredly, undervalue them in that respect. But if we are to look at the naked truth of the matter, I do not think I could honestly tell you that the highest literary, or artistic, or scientific culture always leads to what the vulgar call the substantial prizes of life. Many very illiterate persons have accumulated large fortunes by their own energy and sharpness. Even in the most intellectual professions many men have risen high, and filled considerable posts and enjoyed widespread reputations, who knew but little outside the range of their professional work, though no

doubt they knew that thoroughly well. Do not understand me as denying or doubting that habits of industry and mental training are an advantage for active life; they are an advantage, and a very great one; but what I would urge upon you is that devotion to study, if it is to be real and sincere, must rest on motives far stronger, reasons more conclusive than can be drawn from a calculation of chances in the great lottery of the world. Culture may disappoint you, if you seek it for what can be got out of it; it can never disappoint you if you seek it for itself. Say what we like about the lessening of social differences, there will always be a gulf not easily passed over, a difference which must make itself seen and felt, between the cultivated and the wanton intellect. The man who has read little and thought little, to whom history has no meaning, and for whom literature has no existence, may prosper in business, but he prepares for himself a dull existence and a melancholy old age. There are many such; and sometimes you see them toiling on to the last, determined, as they say, to die in harness, not because they have any further need to work—not even because their work continues to interest them, but because they have no other interest and nothing else to turn to. I hardly know a more miserable alternative than for a wealthy and prosperous man either to exhaust his last years with needless labour,

Bankrupt of life, yet prodigal of ease,

or else to sink into that vacuity and ennui which, to an active temperament, is often worse than even acute suffering.

Here, there are some good advices, as regards persevering industry in learned pursuits, but also something to chill an earnestness of purpose in ordinary affairs. His lordship seems to suggest, that it is very wrong to try to realise a fortune by professional exertion. We quite agree in thinking that mere money-making ought not to be the principal aim in life. Nor, except in some special, and rather hateful instances, is it so in reality. In most cases, the thing aimed at by any one in the ordinary business of the world is to be proficient and successful in his calling. That is a perfectly honourable object of ambition. We would almost go the length of saying that, by pursuing an aim of this sort, England has been made what it is. It has carried arts and manufactures to the highest pitch of prosperity. It has covered the sea with ships, and the land with railways, has built cities, transformed swamps into a fruitful territory, and elevated the intellectual and moral status of the community. In point of fact, but for the enormously persevering industry and surplus profits of the people in their respective pursuits, the nation never could have sustained that terrible warlike conflict of twenty years with France, and might at this period have been a dependency of that country. 'Getting On,' as it is contemptuously called, did it all. It was effected neither by

scholarship—which we by no means disparage—nor by territorial advantage. Land, alone, with every possible backing from the peerage, schools, and universities, would, we imagine, have cut a poor figure in the deadly struggle with Napoleon. No: it was chiefly the power of drawing taxes from the earnestly toiling commercial classes which got the nation through its troubles.

Let no one, therefore, in a social point of view, undervalue 'Getting On.' It has obviously set the British flag flying to the uttermost ends of the earth, is daily extending the scope of our manufactures, and is filling our ports with commerce. In reality, it is that, and pretty nearly that alone, which is encouraging literature and the fine arts, endowing colleges and universities, building churches, supporting schools, and financially keeping the fabric of society together. We wonder who are the great buyers of costly pictures, and who employ the best artists in embellishing their mansions? Why, the men who have all their days been earnestly 'Getting On.' Or, we may put the question, who were the persons who on a late occasion subscribed large sums of money to relieve sufferers by a great natural calamity in France? With few exceptions, they were merchants in London and elsewhere, who, but for 'Getting On,' would not have had a penny to spare for benevolent contribution. Perhaps, to the neglect of other considerations, some men shew too great a keenness in accumulating—for example, the late Alexander T. Stewart of New York, to whose uniquely characteristic history we may by-and-by refer. But on the whole, and as far as we are able to judge, millionaires are anything but mere money-grubbers. Acting under a sense of duty—and we can hardly conceive a higher motive—they derive a pleasure from professional success, while at the same time they enjoy the benefits of scientific and literary culture. One is found to be distinguished for his knowledge of astronomy, another excels as a botanist, and a third gives much of his time to the sanitary improvement of cities—in short, is a public benefactor. Analysing the House of Commons, it would not be difficult to pick out successful engineers, merchants, and lawyers, who but for assiduously 'Getting On,' and taking prompt advantage of opportunities, would never have had the slightest chance of being there. Had they been satisfied with a humdrum mediocrity in their respective professions, and 'prodigal of ease,' the country must of course have lost their services.

What would Lord Derby be at? We all admire the laborious study and self-denial which lead to profound learning. But, strictly speaking, it is not profound learning which carries on the business of the world. Besides, let us not forget, that learning is not always synonymous with intelligence. A man may attain proficiency in various languages, and other branches of study, and yet be poorly cultivated in his understanding, be, in fact, little better than a simpleton. The weakest

men we have ever chanced to fall in with have been good linguists. They could, from college education, rattle you off any amount of Greek, Latin, as well as modern European languages, the tongues of India to boot, and after all be unable, with any propriety, to manage their own affairs, or as regards general knowledge, to make a creditable appearance in company. The truth seems to be, that unless the student, however diligent and accomplished, possess certain natural qualities and aptitudes, his learning will be of very little avail to himself or anybody else. We could point out first-rate scholars—for that matter M.A.s of Cambridge—who, priding themselves on their learning, are so devoid of pliability and common-sense, as to be less useful members of society than young men who have received only the barest elements of education. A hint on this point would not be amiss from the Chancellor of a University. Perhaps it may be viewed as part of a wise Providential design, that scholarship without the attributes of a good understanding goes but a little way in preparing for the varied battle of life. Other things being equal, learning has a paramount advantage, and will in itself prove its own high reward. But even the most learned cannot be the worse of knowing that much in the way of tact and discretion is requisite to make their learning available for any satisfactory or practical end. W. C.

FALLEN FORTUNES.

CHAPTER XXVII.—LAST DAYS.

As soon as Dalton's indignation had evaporated, which it did before he had smoked out his cigar, he felt for the first time in his life thoroughly ashamed of himself. Whatever might have been the aggravation, there had been no excuse for his having acted in a way unbecoming a gentleman; and worst of all, for his insulting a woman. As for what Dawkins and Company might think of his conduct, that did not concern him; when a man is 'lynched,' he very often deserves it; but those who have put that rough mode of justice into effect, may regret the circumstance on their own account, nevertheless. At the very least, people would say, and with truth, that he had 'forgotten himself'; that he had allowed his misfortunes, and the slights—real or imaginary—that had been put upon him, to irritate him beyond the bounds of decency and good manners.

Even this reflection, humiliating and bitter as it was, was more welcome than the thoughts which agitated him when his long walk was over—for he would not go to the expense of a cab—and he drew near his own house. In a day or two it would pass out of his possession altogether, and even now was emptied of all those whose presence had made it dear to him. Thanks to him, they would never be sheltered by its roof again, or perhaps by any other that could be called 'home.' He felt a repugnance to cross the threshold, and drew out a second cigar, with the intention of passing another half-hour out of doors under its solace; he had always been a smoker, but had never known the virtues of the wondrous weed as he knew them now. Then he reflected that cigars were dear, and that when his stock of them was exhausted, he must buy no more. So he put up his case, and went in-doors with a

heavy sigh. It is the smaller stings of Poverty, because they are incessant, and—like the toothache—will not permit you to forget them for an instant, that render it so intolerable.

Having nothing else to do in town, and finding others at that season little occupied, he had contrived to get through most of his business on the previous day; but he had once more to see the auctioneer, to make arrangements not only for the sale which Mr Campden had promised to come up and superintend for him, but for the reservation of various articles of furniture. Not a word had Edith said about saving anything from the hammer; but Dalton did his best to recall to mind what objects had been especially dear to her and the children. It was a painful, almost a heart-rending task to enter her boudoir, and the bedrooms of his girls, each fitted up after her own taste and fancy, and to feel that what they had set such store by was to pass into the hands of strangers. Their books and knickknacks he did indeed reserve, and the smaller of the two pianos, which he rightly judged would be prized indeed at Sanbeck; but when all was done in the way of salvage, it was little indeed by contrast to the general wreck. Then, to complete his wretchedness, he had to dismiss the servants, which he did individually with a kind word and a liberal douceur to each. They had not far to go for places, for Mrs Dalton was known to be an excellent mistress, whose recommendation carried weight; but some of them seemed as sorry as though they had been ruined like himself. 'Such a many years as I have been with you, sir,' faltered one old fellow, 'and now to part like this! I shall never get such another master,' he added naively, 'and far less such a missus.'

'You are right *there*, my man,' groaned Dalton; 'you never will.'

'Might I not stop?' said another (it was the young-ladies' maid), when he had explained to her in a few words their necessity for parting with her. 'I would be glad to serve the young ladies, sir, for nothing, I'm sure. Why, poor Miss Jenny, how will she ever get on without me—that is, for a permanence? Though I don't deny but as Lucy can look after her for a week or two.'

It had been decided that Lucy was the only one of the domestics who, in justice to themselves, could be retained. Old Jonathan Landell had left a housekeeper behind him, who, with a village serving-girl, would be all that the family would require in their new and humble home. But the 'saying no'—always a difficult task to John Dalton—had never been so painful to him as on the present occasion, notwithstanding that he afterwards humorously compared it with Napoleon's parting with his Guards at Fontainebleau.

Proud, tender-hearted, and remorseful, what he suffered during those last days in town, was such as to have almost moved Lady Beevor herself—had she but known it—to pity and forgiveness.

When he had taken his passage—second class—at the London agent's, by the *Flamborough Head*, for Rio, and written to his Edith, as she had requested, to tell her that he had done so, his cup of bitterness was full indeed.

His arrangements with his lawyer were not after all completed quite so soon—for when does that ever happen?—as had been promised; but on the fourth day, by the last train, he contrived to get back to Riverside. It was a wretched night, wild

with wind and rain; and his surprise and distress were great at finding Edith in the closed carriage that met him at the station.

'How could you come out, my darling, on such a night as this!'

'How could I stay within doors,' was the fond reply, 'and wait an hour—when so few are left to me—that could be spent with you!'

What a treasure of love was this that he was leaving, perhaps for ever! What unfathomable depths of unselfish devotion! What agonies, what fears, would his absence beget in her! He almost wished that he did not love her so, or that she were not so worthy of his love.

I sit me down, and think of all thy winning ways,
says the poet, over the sick child that he fears he is about to lose—

Yet almost wish, with sudden shrink, that I had less to praise.

And thus it was with Dalton.

It is one of the horrors of parting with those we love, that even the space of time that is still left to us before we separate, cannot all be passed in communion with one another, but is treasured upon by retrospection and misgiving; fond remembrances of the past, vague forebodings as to the future. Even when she was nestling in her husband's arms, the agonising thought, 'In ten—in five—in two days, he will be gone from me,' would force its way into Edith's mind, and turn her very love into despair. Dalton felt this scarcely less; so did the girls, and even Tony, who was a very affectionate child, albeit, being a child, separation, while it was only in prospect, was not so palpable to him—and therefore all did their best to act, and not to think. The Nook was now vacant, and ready for their reception; and a hundred little plans were made and carried out for making it 'nice and comfortable for dear mamma.' As for Edith herself, she cared nothing about the matter—how should she, whose thoughts were fixed on one beloved object, each day, as it seemed, receding from her gaze!—but seeing that her husband and children took so lively an interest in it, she affected to do the like, and was at least genuinely grateful to them.

The day the piano and the best-loved little pictures, and the favourite knickknacks and books (which included all Tony's juvenile library), came down from town, was made quite a gala-day by the poor Daltons; it was 'so thoughtful' of dear papa, and 'so like him,' to have remembered everybody's likings. Only Edith was afraid that all ought to have been sold, and that they were extravagant in keeping so many pretty things for themselves. But there was no question of the improvement that these articles—quite apart from the sentiment that hung about them, like a perfume—made in the old-fashioned rooms of the farm-house.

The only things it had possessed in the way of ornament were a couple of ancient oak-chests, one in the parlour, and one in the kitchen, very beautifully carved, and which only required a little polish to have made them the envy of Mayfair, which was just then as much given up to those 'dear delightful carved-oak things,' as it afterwards became to that 'too exquisite old china.' Jenny found at once in them the most original patterns for her lace-work, and professed to be better satisfied

with the house generally, and all that it contained, than anybody; but it is doubtful whether, in the first instance, this approval was not assumed to do away with any idea that might have been entertained of the Nook not being suitable for an invalid. She soon came, however, to entertain a *bona fide* love for the place; the literary treasures which it contained being very numerous, and quite novel to her. These, however, could scarcely be counted as ornaments, being for the most part heavy old-fashioned tomes, all of them time-worn, and many of them moth-eaten. By the side of the smart Tennysons and trim Brownings, sent from Cardigan Place, they hardly seemed to be books at all; just as the aged and the ragged who peer through the gates of Hyde Park upon the glories of 'the Row,' in spring-time, half doubtful (and with reason) whether they shall be admitted to a nearer view of them, scarcely appear of the same race as the gallant cavaliers and haughty ladies who are taking their pleasure therein. The time came when Jenny was astonished to find how much poetry, wisdom, and good sense were to be found in these homely volumes, and fought greedily with the moth and worm for their contents; but for the present she confined herself of necessity to praise of the externals of their new abode.

'We shall all be so happy here—at least as happy as we can be while you are away—and so quiet and cosy, dear papa,' she said, 'that I am sure we shall have nothing to wish for, except to get you back again.'

Of all the unhappy family indeed, each of whom played his part so bravely in the cruel calamity that had overtaken them, there was none more courageous, more confident, or more hopeful than she who was the chief cause of their anxiety. Her general behaviour was such as to draw encomium even from Mr Marks the butler, who expressed his opinion in the servants' hall, amid marks of adhesion, that 'Miss Jenny was a rare good plucked un.'

It was Edith's hope that, before her husband's departure, they might have taken up their abode at the Nook, and bidden good-bye to him from what was in future to take the place of home; but quickly as matters were pushed on with this intent, the thing was found impracticable; and when the dark day of his departure came round, they were all still staying at Riverside. The day before, they had driven over to Sanbeck—as indeed they had done every day—and taken a sort of farewell of him there. The sense that when they next went thither, he would not be with them; that the little family would have lost—for it seemed little less than loss—its beloved head, was heavy upon them all; but they bore up for each other's sake.

At Dalton's wish, they walked about the village, in order that he might make himself well acquainted with it, to enable him to picture them there at their ordinary avocations: his wife among the poor folks—though now, alas, she could befriend them little, for she was almost as poor as they; Kitty on the hillside sketching, with Jenny with a book beside her; and Tony fishing in the trout-stream. The summer was coming to an end, but it was pleasant to have these pictures with its warmth and glow still on them. Upon the bridge, which commanded a lovely home prospect, Dalton and his wife stopped a little behind the rest.

'Well, my darling, I shall at least leave you in a beautiful spot.'

'Yes, dearest,' she answered, with a fond pressure of her hand upon his arm, doubtless intended to imply content. For her part, she hated the place, so far as her nature could harbour hate of anything, for was it not already dulled and darkened by the shadow of separation, and would it not be associated ever with that supreme misfortune? The humblest alley in London, with her husband left to her, would have been to her a paradise by comparison with it.

'And we shall meet again - never fear,' whispered he, with a tremulousness that went far to belie his words.

'I do not doubt it, darling,' was her firm reply. Her eye had wandered to the village churchyard, a serene and sunny spot, with a few nameless graves in it, among which some sheep were feeding. She did not doubt it; but that meeting, she felt, would never take place on earth. She would be taken there first, and laid in her grave; and afterwards, in God's good time, they would meet again in heaven. But he was comforted by the calmness of her tone, not only then, but in many weary months to come, wherein, thanks to it, he pictured to himself another sort of meeting.

When they were all together that night in 'mamma's' room, he made, for the first time, a statement of his affairs; explaining what was left of the wreck of his fortunes for these dear ones to live upon. It was a miserable yearly pittance; but he had taken care to provide a hundred pounds or so to meet present needs, and to defray those extra expenses, which it was almost impossible that they, who were so unused to close economies, should at first avoid incurring. Edith listened with obedient ear, but, her mind fixed on the morrow's loss, took in but little of what was said. Kitty, too, was overcome by her sorrow; but Jenny laid every word to heart. They had expected her to be the weakest of them all, but she had resolved to shew herself strong and hopeful; instead of an embarrassment, she would be a prop to their fallen fortunes; nay, even, God willing, a mainstay. Dalton had a word of advice for each, which, coming from him, who was so unused to give it, was as touching as his very farewell. They had all - thanks, as he said, to their mother's teaching - been good children, the best, indeed, he was well convinced, that ever father had, and he had no fears for any of them. The characters of the two girls were already developed; but little Tony was so young.

'There is your pattern, my boy,' he said, pointing to Edith; 'imitate her, obey her, cleave to her. If I should never come back to you, you must be her defender, her guardian, her breadwinner - and may you fulfil your trust, lad, better than I.'

Poor Tony, who understood little of this, was bathed in tears, and clung passionately to his mother.

'I would rather stay with mamma than even go to Eton,' he said, which, under the circumstances, was as strong an avowement as could be made.

'You will have them all about you, Edith; that is my comfort,' said Dalton earnestly.

'But you - you will be alone, my darling,' answered she. It was for him she was thinking, weeping, praying, all along.

The true parting of the little family from its

head took place that night, for Edith could not trust herself to come down-stairs next day till he was gone. He left her in her room, half-dead, but murmuring to the last that she was hopeful, happy, confident of his return - lies that were holier than any truths. She knew that she was strengthening him by those last words; and if they had been her own last breath, she would have 'eked his living out' with it.

THE AQUARIUM.

PART I. ITS FORMATION AND MANAGEMENT.

OF late years it has become almost a fashion to cultivate water-plants, and to establish aquaria, not only in private houses - on a small scale - but in magnificent and expensive buildings, and with all the attendant conditions of committees, boards of directors, and shareholders. With these more pretentious establishments we have little to do. We visit and admire them; and we think that the difficulties to be overcome in arriving at the perfect balance of animal and vegetable life, so as to make one dependent on the other, are a study which must certainly inculcate sanitary principles in the minds of all who have to do with them. Without scientific knowledge on the part of the managers, these great establishments could not exist; and without some apprehension of the principles which regulate all life, the humblest little aquarium, be it only a stickleback and a bit of water-weed in a pickle-bottle, must disappoint its owner. A vessel of water containing plants and animals must be looked upon as a little world; it may, in fact, be so constructed as to have no communication with the great world in which it exists, and of which it forms a part, and yet all its inhabitants live and prosper. If we put a living fish into a jar or globe of water, it dies in the course of a few days, unless the water be changed; but if we put it into cold boiled water, it dies in a few minutes; and no amount of fresh cold boiled water will keep it alive. If, however, we put into the water some plants which naturally grow there, and get them established so that they do grow, our fish will live for any length of time without a change of water. How is all this? What caused the death of the fish in the boiled water, and why does it live with the growing plant? These are problems which must be understood and solved by all who wish to keep a healthy aquarium. Moreover, the same principles apply to any collection of water plants and animals, whether they live in the sea or in fresh water, and the same laws must be obeyed. The animal, whether it be a gold-fish, or a cod-fish, or a many-coloured sea-anemone, has need of fresh air, and its life depends on the presence of oxygen in the water, which it appropriates and which freshens its blood, just as much as we who live in the air require a supply of the same life-supporting gas. All water, therefore, to support life, must contain the gas called oxygen. Naturally it does so, as it descends from the clouds in the form of rain, or bubbles up from the earth a sparkling spring, or rolls down to the sea in rivers, forming the great ocean itself. It never loses its oxygen gas, save as it is used up by the animals that live in it, but

which is again supplied by the numerous plants which bathe and grow in its depths. We may give our fish a good supply of pure fresh water full of oxygen, but after a while the oxygen becomes exhausted and the fish dies; so by boiling water, the necessary oxygen gas is expelled from it, and it cannot support life.

But now we find that plants growing in the water remedy all this, and if properly and skilfully managed in a fresh-water aquarium, will render it unnecessary to change the water for many months, perhaps years. This can easily be understood, if we take a water-plant in a jar of water and place it in the sunlight for a few hours. We soon see little streams of sparkling bubbles rising to the surface of the water—these little bubbles consisting of pure oxygen. The leaves of all growing and healthy plants give off oxygen, the great source of the life-sustaining power not only of the atmosphere, but of the water. We now see why fish will live in water with growing plants, and die without them. But the mutual relation between plants and animals, as carried on in the world, extends even further than this, and is not altered at all because they live in water. Not only do the plants produce oxygen for the animals to live on, but they appropriate and use up in their own tissues the carbonic acid gas thrown off by the animals. Unless this mutual arrangement existed, both plants and animals would die. Carbonic acid, which is poisonous to animals, is absorbed by the plants—it is composed of carbon and oxygen—and plants have the power of separating and using the carbon for their own substance, and letting go the oxygen.

Thus we find in a jar of water a true microcosm—a little world, in which all the changes go on which are necessary for the maintenance of the life of man and animals on the surface of the earth. Our little water-world too—be it even our humble pickle-bottle aquarium—is subject to all the laws of health of which we now hear so much. Over-crowding is one fruitful source of disease and death in our collections, and we must be very careful only to attempt to keep as much animal life as our growing plants are sufficient to supply with oxygen. Experience is the best teacher in these matters, for we cannot so exactly measure the cubic feet of water necessary for the life of a fish, as of air for the life of a land-animal. Even in the best regulated aquatic establishments, death will occur and decomposition set in, which, if suffered to remain, soon spread disaster through the tank. We have scavengers in the air in the shape of vultures and carrion crows; in the water, in crocodiles, sturgeons, water-beetles, snails; and it is necessary to provide some of the latter useful creatures for our aquatic community. In a small aquarium, we would advise some one or two of the varieties of mollusca, such as water-snails; due care, however, must be taken that they confine their appetites to the garbage and decaying matters of the establishment, and do not devour our living plants.

Before entering fully on the management of an aquarium, and giving suggestions as to its establishment, we recall very vividly the early efforts to keep water-creatures living and thriving in our homes as in their own native streams. It cannot be doubted that the first idea was suggested by Mr N. B. Ward's successful cultivation of plants in glass cases. As early as 1849,

Mr Ward stated, at a meeting of the British Association at Oxford, that he had succeeded not only in growing sea-weeds in sea-water, but in sea-water artificially made. This may be considered to be the first step towards the marine aquarium. In 1849, Dr Lankester succeeded in keeping sticklebacks in a jar of fresh water containing growing *Valisneria* (a water-plant) and starwort; and in 1850, Mr Warrington read a paper before the Chemical Society explaining the conditions necessary to the growth of plants and animals in jars of water.

Mr Alfred Lloyd, who is a great authority on aquaria and their management, tells us that in 1853 he began to make his earliest experiments with a few small glass jars and an earthenware foot-pan. At that period there was nothing to guide any one as to how they should proceed—neither books nor men; and so the real lovers of nature groped their way alone, encouraged by every fresh success to new experiments. Well can we recollect the modest glass jars with the gleamings from ponds passed in country rambles—the bits of weed growing in shingle at the bottom of the jar, with the sticklebacks, a water-spider or two, and a few water-snails, which graced and animated the study of a large-hearted philosopher and born naturalist who has lately passed away from us. Dear to our memory also is the row of tumblers of sea-water outside a cottage window-ledge in a small sea-side village on the coast of Suffolk, placed there by the same nature-loving hands, each glass containing a bit of rock or stone to which was attached a bright-coloured actinia (sea-anemone), which, under the influence of the light, expanded and glorified itself into an animated flower. Many a group of wondering and admiring villagers has stood examining these beautiful creatures, little guessing that in every pool on their own coast numbers of them blushed unseen and unnoticed! But these tumblers required refreshing every day; and the morning occupation for the children of the household was to bring up a can of fresh sea-water and to change the water in each tumbler. After this refreshment came the great exhibition of the day. Each living flower seemed to vie with the other in spreading itself out, in unfolding all its tentacles, and in displaying every variety of colour and shade.

By-and-by a footbath was brought down from one of the bedrooms, or a large pie-dish smuggled from the kitchen, and the first experiments tried in keeping a marine aquarium. Much vexation of spirit and disappointment ensued. The sea-anemone would die; the hermit-crabs struggled out of their shells, and dragged up the growing weeds, and failure resulted after many early attempts. But at last the true balance was found; the weeds began to grow, the animals to live just as the time for departure from the sea-coast was inevitable, and it seemed impossible to transport the now perfect aquarium to the London study. But even this difficulty was overcome; and by means of bottles, and cans, and gallons of sea-water carefully packed, the precious treasures were safely conveyed far away from their native shores, and flourished for many years in an inverted propagating glass, set in a piece of rock-work, in one of the most densely crowded streets of smoky London.

No: that we are surrounded with aquaria,

when every great city and nearly every large town has its own aquarium, it is curious and interesting to trace their beginnings. The aquarium in the Zoological Gardens, Regent's Park, was the first that was opened to the public. In May 1854 it was announced as open, and described by Dr Lankester in the pages of a London journal; but even then the idea of a marine aquarium away from the sea-coast was thought to be an impossibility. It was only fresh-water plants and fishes that were then to be seen in the Regent's Park gardens. It was Dr Lankester who first ventured to write, when describing this little aquarium: 'But why should we not have sea-fishes? These are to come. Erelong, every inhabitant of London will be able to see what up to the present time has been seen only by the adventurous and sea-tossed dredger, who, casting his net to the bottom of the ocean, has beheld its numerous inhabitants in the freshness of life.' The same enthusiastic naturalist writes also in 1853: 'Who that has passed a stream, knowing that its waters are thronged with life, has not longed to have the power of watching the movements of its swift and timid inhabitants? In this fish-house we see at a glance what days of watching elsewhere would not afford.' Nearly a generation has passed away since these words were written, but how true they have proved to be! The writer of them lived to see his prophecies fulfilled in Britain and on the continents of Europe and America.

We have said that the true principle on which an aquarium should be conducted is, never to change the water, but so to aerate and refresh the original supply as to maintain it always in a pure and perfect state. The water in the Crystal Palace Aquarium is the same that was taken from the sea five years ago; and the same system, with some improvements, is adopted in the Westminster Aquarium. The means used to attain the end in view are several. Not only is great importance attached, both in the fresh and marine tanks, to the healthy growth of plants which afford oxygen to the water; but also active and brisk contact with the air of the atmosphere is found greatly to freshen the water. *Motion* in the water is therefore essential. In the large aquaria, this is insured by an arrangement of tanks, into which the water is pumped, and from which it flows rapidly, circulating through the tanks inhabited by fish. In its passage through the air, it absorbs a considerable quantity of oxygen; and in the smaller domestic apparatus of which we more particularly speak, the same thing is effected by frequently drawing the water up through a glass or gutta-serena syringe, and squirting it back into the vessel from some height above it, so as to let the jet pass through after having come in contact with the air. Mr Lloyd says: 'Water in aquaria should be regarded as a practically indestructible medium for the administration of atmospheric air to plants and animals.' At Westminster, the water travels over a distance of nearly three miles between the beginning and end of its circuit, for the purpose of aeration.

Perhaps some of our readers may be entertaining the notion of forming an aquarium. It may be in a glass vessel, a globe, or vase placed in one of the window-cases—noticed in a recent article—surrounded with rock-work and growing plants. Nothing forms a prettier or more attrac-

tive centre for a window-garden than one of these pools or crystal tanks of water in a state of healthy preservation. Or it may be that the only available receptacle for the aquarium is a large glass pickle-bottle, or a jar such as confectioners use, or even a finger-glass. Well! more living organisms than one observer could well describe in a year may grow, and live, and flourish in the smallest of these vessels, especially if attention be paid to the microscopic inhabitants of the water, whose name is legion. In dirty situations and in smoky towns, it will generally be necessary to cover the top of the aquarium with a piece of glass or muslin, to keep out the 'blacks.'

The first thing to be done in the formation of a fresh-water aquarium is, if possible, to establish the plants—to place them in suitable soil at the bottom of your tank, and leave them undisturbed exposed to the light, under the water, until they begin to grow, and the little active bubbles of oxygen are seen rising to the surface of the water. We have grown *Vallisneria spiralis*, water crowfoot, the star-worts, the various species of Chara, and the Canadian water-weed (*Anacharis alismastrum*) in profusion. The soil best to plant such in has roots, is clean river-sand mixed with pebbles. Such plants as *Conserve* and others which float on the water and do not take root in the soil, do not, of course, require planting. After choosing your plants from such as you may collect from rivers and ponds in any country ramble, plant them, and cover the surface of the ground with bits of rock, pebbles, or anything that is suitable and in harmony with the rest of the arrangements. Do not put sea-shells into a fresh-water aquarium, or artificial objects where all should be natural. Then fill the vessel with water very carefully through a funnel or syphon, so as not to disturb the soil and the roots of your plants.

The same caution has to be observed in establishing a marine aquarium, which, it must be confessed, is altogether a task of more difficulty than a fresh-water collection. The weeds must then be introduced growing and attached to the stones on which they have naturally established themselves. The fronds and sprays of sea-weed washed up by the tide and left on the shore are of no use, and will only decay and injure the water. It is growing and living vegetation that we want. A selection of the pretty red sea-weeds so common in rocky pools, with the bright green fronds of *Ulva latissima* and *Bryopsis plumosa*, give colour and brilliancy to a marine aquarium, which is unattainable in the fresh-water colony. But it is not so easy to replace the inevitable losses which must take place in the early stages of a marine aquarium when removed from the sea-side. Let all who are near the coast establish a domestic sea-water pool, and enjoy all the pleasure it affords in watching the development and curious habits of the beautiful creatures who may colonise it. But in towns, unless under very favourable circumstances, a fresh-water aquarium will yield more satisfaction with less vexation, as we know from experience. In order to manage an aquarium comfortably, a few simple instruments should be kept at hand. A little hand-net, which may be bought for sixpence or made for a penny—simply a ring of galvanised wire with a muslin bag fastened to a stick for a handle. This is convenient for catching the creatures, fish or shells, without putting the

hand into the water, and it is also useful in removing dead bodies. A pair of wooden forceps, like a pair of glove-stretchers, is also most convenient for the same purpose to nip off bits of decaying weeds or to catch floating particles in the water. Glass tubes of various sizes may be kept, which act by being put into the water with the finger over the aperture at the top. The tube, until the finger be removed, will remain filled with air; place it over any little bit of decaying weed or particle of refuse, and on removing the finger, the water will rush in, carrying with it the offending object up into the tube. Then a glass syringe or squirt is necessary, with which to aerate the water thoroughly at least once a day, and oftener if possible, by filling it and then holding it high above the tank to squirt the water back again. Some persons constantly use a pan or bellows with an india-rubber tube attached to the nozzle, to propel air in through the water. This device unquestionably acts well, and refreshes the animals, just as a 'blow on Hampstead Heath' or a run to the sea-side invigorates the inhabitants of many a close workroom in London. A glass syphon, or, what we find better, a long piece of india-rubber tubing which acts as a syphon, is necessary to effect a change in the water when it is evident that something has gone wrong and the evil must be discovered and eradicated.

We have frequently been obliged to do this when we kept a marine aquarium in London, and perhaps discovered a dead sea-anemone or a little fish under a stone, giving off offensive gases and escaping detection in the midst of the sea-weed. After removing the dead mass, and perhaps the stones infected by it, we have, by thoroughly aerating the water, restored the aquarium to a perfectly pure condition. We are thus particular in giving directions as to the formation of an aquarium, because we know from experience the difficulties that surround first attempts. It is by no means to men of science alone that the study of aquatic zoology is indebted. Amongst the earliest successful attempts to keep water-animals captive in a living and healthy state, were those of ladies in their own homes. When we come to consider in our next article the animals which live and thrive best in aquaria, we shall find our best authorities are ladies who have experimented and surmounted difficulties, and have given us the result of their labours. It was a Scottish lady, Miss Elizabeth Dalrymple, who largely assisted her brother, Sir John Dalrymple, during his half-century of study of marine animals in Edinburgh from 1795 to 1850. It was a lady who kept a cage of captive cuttle-fishes at Messina in 1842, and wrote a charming book on the habits and ways of the octopus, from her own observations. And the first successful attempt to keep sea-water fresh and unchanged, by the action of living sea-weeds, was made by Mrs Anna Thynne in 1846. Only two ladies are now alive who are known to have reared captive sea-anemones from babyhood to adult age. For a period of ten years, from 1860 to 1870, but little was done, or written, or thought publicly about aquaria; still, we know of households where they were kept and fostered, and of women, young and old, who tended, and fed, and cared for the living pets of their aquaria with as much zeal as others bestowed on the feathered friends of an aviary, and with the additional reward of having apprehended and applied the true prin-

ciples of science to their small water-world. We propose in our next paper to enter more fully into a description of the interesting inhabitants of the aquarium, fresh and marine.

JOE WICKHAM'S RECKONING.

It was ten o'clock on a summer morning in Cowra Creek, Australia. There were symptoms of unusual excitement in the settlement. Something had occurred to disturb its usual routine. An item of news had arrived from Westerton which had drawn the men from their work for the interchange of opinion and discussion, and there was an indisposition to renew labour for the morning at least. The discussion had perhaps been most animated among the group in front of Sam Coulter's hostelry, the *Emu*.

The chief speaker throughout had been Captain Reginald Brander. 'Look at it how you will, I say it's the coolest bit of work in this way that's been done in the colony for some time back,' he was saying. 'But if this rascal shewed pluck, that wasn't any reason why those fellows should have knocked under to him without as much as stirring a hand. It's a mighty curious thing that one man should be able to stick up three in that easy quiet way. If one hadn't known the men, you might have thought the whole thing looked like a put-up job. I don't know anything about the Westerton fellow; and you don't look for much fight from little Tom Sharpe, though he's smart enough at his own trade; but Joe Wickham's big and long enough to have shewn more grit. Yet I never thought much of that chap Wickham; one of your quiet, secret sort, with not a spark of fun or life in him; always the same cautious, watchful way about him. I've never liked these silent, close-mouthed men. He's not fit to live in a gold country, a chap who'll hardly join a friendly liquor, and won't touch a card or a billiard-one. Doesn't that look something like fear of dropping a little of his cash? But I'm seldom slow at saying what I think of a man, good or bad, as you know, boys; and I say of this Wickham now, what I've more than once thought, that I believe there's precious little pluck in him of any kind.'

What was the circumstance that was quickening the pulse of Cowra Creek will have been partly gathered from the above fragment of the conversation at the *Emu*. The mail from the Creek to Westerton had been 'stuck up' on the previous evening by a single horseman, and money to a considerable amount, in bank-notes and gold coin, but chiefly the former, which was being transferred to Westerton, secured by the robber.

On the evening of the day when the conversation with which this narrative opened took place, I was down at Wickham and Ford's hut. Whenever I had a spare hour at night from my professional duties, as the single doctor in the settlement, I used to drop in and smoke a pipe with the two men. I was a little curious to hear something more of the incident which had been the almost sole topic of gossip during the day, though I was not disposed to press Joe upon the subject, if he should shew himself at all disinclined to talk about it. I found him and his mate, Dan Ford,

alone, and soon discovered that they had been discussing the matter uppermost in my own thoughts. Discussion is hardly the word to apply to their talk, however, for it had been almost entirely confined to Ford.

Among the company who had that morning been passing various opinions on the affair of the mail-robbery, was a rather special acquaintance of Dan Ford's, a man of a silent turn in general society, who had taken little share in the conversation, but who had, partly on this account, no doubt, retained the most of it in his memory with great accuracy. The bulk of it he had retailed that afternoon to Ford, who had been repeating it to Wickham when I came in upon them. It was easy to see that Dan's back had been not a little set up by what he had learned from his friend. Dan was attached to his mate, with a simple but most thorough confidence; and Captain Brander's references to Joe, as reported by his friend, were of a sort especially calculated to move him to anger and disgust.

'Seems the captain's bin talking unusual tall,' he said; 'though he's always in the ruck at that any time. I never admired Capt'n Brander the way some do; and he's not risen in my 'pinion for the way he's bin gassing this morning. I dunno why, Joe, but it's struck me 'fore this that you're not a favorite of his, and now it looks pretty certain.'

'I've never had much to do with him, one way or another,' said Joe.

'That's perhaps just the reason,' replied Dan. 'Thinks you've fought shy of him, maybe, and feels a little rough on it. I don't give him much of my company, neither; but then I'm of no account.'

Wickham was silent. He sat smoking, with a thoughtful, somewhat self-absorbed expression in his face. He was a tall man, of a spare build, long and rather loose-limbed. He had a long face, light indefinite-coloured eyes, and a sallow-brown complexion. His face was bare, save for a thin, sandy, unimpressive whisker; and its normal expression, like that of a great many other people, was not marked enough to court or give scope for minute characterisation. What there was, was honest and agreeable.

After a short pause, Wickham said, speaking slowly: 'You've heard pretty well the ins and outs of this matter, doctor, and I can tell you little more about it. Captain Brander, and maybe some of the others, think we should have shewn fight, but it wouldn't have been easy. The fellow met us in the turn of the road where it leads out of Wattle Gully, where you know it is just wide enough for the coach to pass. Perhaps you don't know who the Westerton man was. It was Mr Glenn, the lawyer, who's so short-sighted that he can't see five yards before him without his glasses, and that helps to make him as timid and nervous at night as a lizard. That reduced our fighting force to two. It didn't seem to me possible that we could have made any stand. The fellow covered us with his six barrels, and would have shot us down as easily as 'possums, if we had raised a hand. But I may be mistaken; and if it was possible to have shewn a gamer front, to have rushed in upon the man, or something of that sort, then I can only say that neither Tom Sharpe nor I were the men to do it; and then,

perhaps, Captain Brander was not so far from the truth.'

'You'll not make me believe that easily, Joe,' said Dan Ford.

One evening, rather more than a week later, Wickham and I had started for a stroll and smoke in the direction of the river. In passing the *Emu*, we found an unusually large gathering of men about the place.

'By-the-bye, Joe,' I said, stopping, 'I had almost forgotten. This is the night of Professor Gregory's entertainment, you know. Supposing we look in for a little.'

'Very well,' replied Joe, and we entered the inn.

The entertainment which Professor Gregory and his two assistants were to offer to their audience was of that class generally announced to the public as 'a grand assault of arms,' and was to consist of the usual items comprised under that designation—fencing, boxing, broadsword and bayonet exercise, severing a bar of lead, &c. Mr Coulter's largest room had been fitted up with a hasty wooden stage for the occasion. Business began shortly after Wickham and I entered the room. After the regular programme of the evening was concluded, the professor invited any who chose to step upon the platform, and engage in a little friendly play with the gloves, with himself or either of his assistants, or one with another. Several of the men accepted the invitation, and put on the gloves, and the evening now took a more informal, and, so to speak, sociable character. Pipes were lit, a free exchange of conversation began among the audience, and a sudden and contagious thirst exhibiting itself, a desire for something to alleviate it, was natural. Foremost among those who were figuring on the platform with the gloves was Captain Brander. It was one of the exercises in which he was at home, and he was the only one with sufficient confidence in his own powers to try a bout with the professor. Several of the men were found ambitious enough to measure themselves with the captain, but each in turn tired of the sport somewhat soon. He seemed in fine form and humour this evening for the special work in hand, and won cordial commendation from the professor. He had had enough inward stimulant to quicken his pulse, without overheating his temper, or at all unsteady his hand or eye. He stood beside the professor, glancing carelessly around him, when I saw his eye rest upon Wickham and myself, who were sitting well back in the room and were just about to leave. I thought I noticed a slight gleam come into his eye as it fell upon Joe, and the next moment he accosted him.

'Can't you do something with the boxing-gloves, Mr Wickham?' he said. 'You've a long stretch, and ought to reach a man of my height pretty easily. Suppose we try a turn or two.'

'Thank you, captain,' answered Joe quietly; 'but I'm no hand with the gloves.'

'Come, I say,' replied Captain Brander; 'a fellow with an arm like yours mustn't talk like that. All you want is to hit out—and an ounce or two of pluck, of course.'

Wickham returned no answer, and his face made no sign.

'It would be interesting to know,' continued the captain, not caring any longer to conceal his

feelings, and resorting now to the fine vein of irony for which he had made a name in the Creek, 'what Mr Wickham fears. A man mustn't expect to count for much who can't stand a little rough play. There's a certain lady some of us know by sight who wouldn't like to hear, I reckon, how her young man's come out to-night.'

I looked at Joe. A faint colour flushed his sallow-brown face, and I saw the corners of his mouth twitch suddenly. He touched me on the shoulder, and rose to his feet, and we left the room, but not soon enough to miss hearing the general laugh which followed Captain Brander's speech.

I walked back with Wickham to his hut, and went in with him. We sat down and lit our pipes; a minute or two after, Dan Ford came in. He and I talked a little together on indifferent subjects, both avoiding that which was foremost in the thoughts of each. Wickham scarcely spoke. At length Dan ventured: 'The captain was uncommon nasty, to-night, Joe.'

Joe rose from his seat, and stood facing us. He took his pipe from his mouth, and looked steadily at us, and there was a light in his usually rather lustreless eyes.

'I didn't make much of a show, did I?' he said. 'The fun was all on one side. But I'm hoping to see the day when between Captain Brander and me there'll be a squaring of accounts.' As Joe ceased speaking, the short clay-pipe which he was holding by the bowl, crumbled suddenly in his long sinewy fingers, and fell in fragments on the ground.

Miss Kate Farren was the assistant-teacher in the school at Cowra Creek. She was twenty-five, rather under the middle height, with a cheerful frank face, clear eyes, a brown colourless complexion, and smooth light-brown hair, threaded with a gleam of gold when the sunlight fell athwart it. Her figure was neat, and her attire gave the impression that aught like deshabille of costume was incompatible with her nature; but she may have indulged in it at odd times, for all that. Miss Farren was the young person to whom Captain Brander's allusion bore reference. Wickham had saved money, and had been especially successful in Cowra Creek—the claim, in which he held a sixth share, having turned out one of the best of the smaller ventures in the settlement.

No traces could be discovered of the Cowra Creek and Westerton mail-robbery. Though so short a space of time intervened between the commission of the deed and the starting of the mounted police in pursuit, nothing was found to indicate with certainty the direction in which the bushranger had betaken himself. The tracks of his horse's feet were traced to the bank of the river which flowed close by the spot where the affair had taken place, but they could not be taken up again on any point on the other side. The skill of the black trackers was entirely baffled; and the search for the robber had soon to be abandoned, from sheer lack of ground to work on. The authorities could only wait and hope that some traces of the man might come to light by-and-by.

The opinion became general in Westerton and Cowra Creek that the highwayman had by some means got clear altogether of the district, and perhaps of the colony. This impression had

almost settled into a conviction, but it was to be disturbed in a very unmistakable manner. In little more than three months after the first robbery, the mail was again stuck up in the same spot, and by the same man, who this time secured a sum of money nearly equal in value to his former prize.

A circumstance connected with this second robbery was remarkable—namely, the knowledge which the highwayman must have possessed of all that went on at Cowra Creek. Ever since the first robbery, a mounted trooper had accompanied the coach from the Creek to Westerton, the authorities deeming it advisable, for a time at least, to treat the ordinary mail in some measure as though it were a gold escort, which is of course always guarded; the strength of its guard being generally proportioned to the value of the freight. But on this particular occasion, the trooper who was on duty as escort to the coach having suddenly taken ill at Cowra Creek in the morning, was unable to accompany it, and it had therefore started for Westerton without him. That the robber had hit upon this particular evening for the execution of his design entirely by chance, was almost past belief.

This second robbery of the Cowra Creek and Westerton mail had been committed on a Friday evening. On the Saturday morning following, a company was assembled in front of the *Emu*, composed of very much the same elements as that former one, to a portion of whose deliberations the reader was introduced at the opening of the narrative.

'Has any one seen anything of the captain this morning?' said Will Royce. 'I wonder what he thinks of this new bit of work.'

'The captain went to Westerton on business yesterday, and came back early this morning, I believe,' answered Dave Tarrant; 'so he'll maybe have something to tell us of what they're saying about it there.'

As Dave spoke, Captain Brander's figure was seen coming at a leisurely pace up the street. The men gathered about him, and greeted him with a series of interrogations.

'What are they saying about it at Westerton?' said he calmly, without removing his cigar from his lips. 'Why, pretty much what you're saying here, I suppose—that he's a mighty cool hand, and a smart one to boot. But one thing you may be sure of; there'll be a pretty tidy sum put on the fellow's head now, so that if any of you are inclined for a bit of amateur trap's work, you'll have a chance now. Some of you have got to do with claims poor enough to make it worth your thinking about it, perhaps.'

Captain Brander was right. During the course of the ensuing week, an official notice was issued at Westerton proclaiming a reward of one hundred pounds to any person supplying information that should lead to the discovery of the robber; and a reward of three hundred pounds for the capture of the same alive or dead. But for some days not so much as a rumour was heard of the highwayman. No more definite traces were discovered of his track than on the occasion of his former depredation. The prints of his horse's feet had been followed to the river, as before, and then, as before, lost. The annals of the colony had not on record an affair of the kind that had been

managed with so much apparent adroitness, or over which there hung such an air of mystery.

But one evening, about a week after the event, a wood-cutter who was accustomed to work along the river, brought the intelligence to Cowra Creek, that he had come upon what he fancied might be the tracks of the bushranger. He had found the prints of a horse's feet leading at right angles from the bank of the stream, at a point in its course nearly half a mile distant from the spot where the robbery had been committed, and between it and Cowra Creek. The weather had been dry for a fortnight back, and the tracks were still distinct. The man had followed them for some distance, and said they led in the direction of a solitary ravine in the forest where there were the remains of a deserted sawpit. Blackfork Glen the place was called, a lonely spot, somewhat difficult of access, and known to few persons in the district besides one or two woodmen. The man thought the place would be a likely enough retreat for a bushranger.

On the same evening the talk among the men at the *Emu* turned mainly on the subject of this information, and whether it seemed likely to lead to anything. Wickham had asked me to drop in with him to the *Emu* and hear what was going on. I was rather surprised at the request, but attributed it to the interest which the affair of the second robbery was exciting in Joe, in common with almost every individual in the township. When we entered the inn, Captain Brander was, as usual, leading the talk.

'Now, here's a chance for some of us,' he was saying: 'there's only the one mounted trap in the Creek at present, and he'll not start alone after this fellow, you may swear. He'll go along to Westerton to-morrow to get orders from headquarters; and by the time three or four of them are ready to start, a man from here might be on the spot. Well, I've a proposal to make. I'm ready to go with any other man and follow up these tracks to-morrow. I don't think it'll lead to anything, myself; but it may. It's a likely enough spot, Blackfork Glen, according to accounts, for a ranger to hang out; and three hundred's worth the trying for, anyway. But one thing I bargain for: I only want one man with me. Two to one against this fellow's more than enough in my opinion, though he be as game as a tiger, and the thing's not worth the trouble for less than a chance of a hundred and fifty pounds. Now, boys, that's my offer! Who's going to take me up? A slant for one-fifty, cash down, and immortal fame to the bargain. Don't all speak at once.'

'I take your offer, Captain Brander,' said Joe Wickham, in a quiet distinct voice. 'I'll go with you to-morrow to Blackfork Glen.'

All eyes were turned upon Joe as he spoke. He was about the last man in the room who could have been thought likely to take up Captain Brander's proposal.

'Are you quite sure you want to go into this business, Mr Wickham?' said Captain Brander.

'Quite,' answered Joe; 'if you're equally willing.'

'Oh, I'm quite agreeable. One man's as good as another. We'll start early in the morning. But it's wonderful what even the chance of a square run will do. Actually puts grit into a man sometimes.'

The tone in which Captain Brander spoke, and

the glance he threw round the room, gave additional point to his last words. As Wickham and I left the room, Dan Forl, who had also been among the company, joined us, and as we walked down the street he whispered in my ear: 'If this ain't a queer start! What ever's Joe's game, doctor?'

Whatever it might be, Joe was not disposed to enlighten us that evening, and we did not, therefore, question him.

The compact between Captain Brander, with its attendant circumstances, was sufficiently novel and unlooked-for to attract quite a considerable gathering to see the two start on their quest, accompanied by Hicks the woodman.

It was towards sunset that the same assembly, myself among the number, again met in front of Sam Coulter's premises. It was expected that Captain Brander and Joe Wickham would be back not later than sundown, and we were waiting their return. The sun had set some minutes behind the wooded hill-tops, leaving a narrow space of crimson sky where the road towards Westerton dipped and curved, when the figures of two horsemen rose into sudden view, and shewed dark by contrast against the vivid horizon. A single glance was sufficient to shew there were but two. As they drew near, and their outlines grew more distinct in the gathering dusk of the brief twilight, something abnormal and unexpected about the appearance of one of the figures caused a puzzled glance to pass from one to another of those who were watching their approach. One was leading the horse of the other, who seemed incapable from some cause of guiding it himself. The reason was soon discernible: one of the men was bound to his horse, and had his arms strapped behind him. In a few moments we could identify the two men, and as we did so, our previous perplexity passed into sheer astonishment. The two horsemen rode up in front of us. One was Joe Wickham. The other, besides being bound firmly to his saddle, had his broad-brimmed Panama hat drawn over his face; this, Joe, with an expression and gesture tinged with quiet contempt, tilted back with the handle of his whip; but this was quite unnecessary to enable us to recognise his companion. It was Captain Reginald Brander.

'Gentlemen,' said Joe, 'this is the man who robbed the mail, and I shall prove it.'

After our amazement had somewhat subsided, Joe continued as follows: 'I may tell you now that I suspected the man from the beginning. That first time he stuck up the coach, he was very cleverly made up, but from where I was seated on the box, the voice at once struck me as being somehow familiar. He disguised it well, speaking in a hoarse, muffled kind of way, and all I could feel sure of was, that it was not entirely strange to me. But when I got back here, the first time I heard Captain Brander speak, the resemblance of his voice to the robber's immediately occurred to me, though till then, I had not once thought of the two men in connection. This was all I had at first to go upon, and of course it was not enough to make me disposed to communicate my suspicions to any one else. What had struck me did not seem to have occurred to Tom Sharpe, or I might have compared notes with him; and Mr Glenn, the Westerton lawyer, was not, I knew, sufficiently acquainted with

Captain Brander to have been in the least likely to have recognised him merely by his voice, much disguised as it was. Without anybody seeing it—at least if none of you noticed it, it's not likely any one else did—I kept a pretty close watch on Brander. I knew, of course, that a mere resemblance of voice might, after all, be only chance; but one or two other circumstances about the captain seemed to strengthen my suspicions. It had got about some little time before the first robbery that the captain was getting pretty low in funds; the "What-can-touch-it" claim is bringing the shareholders next to nothing, you know; and I suppose some of you were beginning to get a little shy of him at the curls. I even heard that he talked of leaving the Creek altogether, as the luck was all against him here. Well, after the affair with the mail, he seemed to be set up in funds again, and there was no more talk of his going off. Perhaps you noticed that there was no one talked more of the robbery than he, and that what Captain Brander said and thought about it was quoted by everybody. He always talked of it, as you all know, in a high and big sort of way, and was very warm and indignant about it sometimes, especially at first. Now, you may think that nothing of this was much to reckon upon; and neither it would have been to you or to any one else; but to one whose suspicions were already aroused, these things had a meaning. Still I knew well enough that I was not quite an unprejudiced judge of Brander. He has made a set against me since first he came here, and lately, as you all know, has shewn his feelings in a pretty rough fashion. Before the mail-robbery, his opinions about me did not touch me much; but after that, and especially on the evening he made those allusions to a certain lady, I didn't feel very smooth towards him, you may guess. But I knew that this itself might make me over-eager to make out a case against him in my own mind, and so I was cautious. Not until the second sticking-up did I feel certain that I was on the right track, but I did then. The way the robbery was timed, just on the day when the coach was without a guard, could not, I calculated, have been by chance; and there was added to this, that on that very day, the enterprising gentleman by my side here left the Creek for Westerton, and did not return till next morning; you will remember that. This coincidence, taken with the evidence I had already got together, seemed to me conclusive, and I felt sure of my man.

'How to bring the matter home to him, was now my object, and it puzzled me a good deal. I had fixed on no definite plan on that evening when the noble captain here made the obliging proposal to go with another in search of the robber. His offer seemed to me quite the thing a man might do to divert the scent, as it were, and I at once thought I saw the chance I had been waiting for. An idea suddenly occurred to me which, if I could carry out, would enable me to wipe out all old scores between the bold sparrer and myself to the full. So I closed with his offer, as you saw. To only one person did I tell the plan in my mind that night, and that was the lady he was gallant enough to make mention of. I had said nothing to her about the whole affair up to this time, any more than to any one else, but now I thought I ought to tell her everything.

She was astonished, as you may suppose, and, as you may also imagine, a good deal startled. I had to manage things pretty cautiously, and I haven't a light hand in that sort of thing, I expect, before I could reconcile her to what I was about to undertake; but I managed it somehow. She's a gem of her sex, in one respect at any rate, though, of course, I believe her that all round; she's such a reasonable girl, though I say it, and sees a thing so quick in the light you want her to, even when you put it clumsily, as I often do. And now I must come to what you want chiefly to know, I suppose. After Dick Hicks the woodman had put us fairly on the tracks he had discovered, he left us, as had been arranged. The prints of a horse's feet were there, certainly, and still distinct enough to be easily followed. Whether they led to Black-fork Glen, or, indeed, how far they led at all, I cannot say, and it matters very little now. Brander obligingly led the way for about a quarter of an hour, I should think, after Hicks left us; I on the watch for a chance of bringing matters to the point I wished. Our way lay through thick bush, until at the end of a quarter of an hour or thereabouts, as I say, we reached a small open space where the trees separated a bit. This was what I had been waiting for. Captain Brander and I had ridden together without exchanging hardly a word. His desire to give no sign of our approach to the concealed bushranger, demanded silence on our part. As soon as we had got fairly out from the bush, and had elbow-room, I wheeled round upon him, covered him with my revolver, and was rude enough to say: "Captain Brander, you robbed the Cowra Creek coach." The captain has a considerable command over himself, as you know, but he was fairly taken aback now, and he shewed it. He never answered a word, but darted at his pistols, which were stuck in his holster. But I expected this; and before he could whip them out, I was upon him, and had him on the ground, by the throat.

"You stuck up the mail," I said again. "And now you and I are going to clear off old scores. I'm going to take you back bound, or you're going to fix me somehow; now we're man to man."

'An oath struggled in his throat as we grappled and closed. With his fists the captain would probably make short work of me; I never learned much in that way. But it's different with wrestling. I was born in a part of England that breeds as fine wrestlers as any in the old country, and when I was a lad I was as good as my neighbours at this sport; and haven't forgot the trick yet. Besides, I am a good bit longer than my friend there, and my arms are of the sort that are made to take a powerful grip. I felt sure that in a close struggle I would be more than a match for him; and it turned out so, which I think the captain will admit. When I once got my arms fairly about him, I felt that I had him safe, and knew how the matter would end. Brander fought desperately, and strove hard to get at his knife; but I was too many for him in every way, and I had got too the first grip. I tried an old trip which I have not forgotten, and the captain fell under me; I set my knee upon his chest and pinned him breathless to the ground. Then I took a rope from my pocket, which I had brought with me, in the event of things turning out as I had hoped, and as they did, secured his arms behind

him, and he was helpless. All I had further to do was to set him on his horse and bind him to the saddle. The whole affair did not occupy more than ten minutes, and the horses had stood by the while, looking on in a half-startled way. Had our struggle lasted longer, Brander's animal, for what I can say, might have made off; but my nag would have stood in any case. And so we rode back and—here is your prisoner.'

A month after the above events Captain Brander stood his trial in Sydney. There was no difficulty in proving the two robberies against him. A number of the notes that had been taken from the mail were found in his possession. This alone, under the circumstances, would have been almost enough to convict him. Taken together with Wickham's clear and consecutive story, and with other points of evidence which the course of the trial brought out, it formed conclusive proof of his guilt. He is now fulfilling his sentence, fifteen years with labour, in Sydney jail. Dick Hicks was suitably rewarded, and the balance of the three hundred pounds so well earned, made Kate and Joe happy.

A NEW WORLD IN CENTRAL AFRICA.

IN TWO PARTS. PART I.

THE extraordinary journey and important discoveries made by Lieutenant Cameron have suddenly given a new interest to African exploration—that subject which, ever since the days of James Bruce and Mungo Park, has been so attractive to Englishmen. If Bruce had reached the true sources of the Nile, Park those of the Niger, and other travellers those of the Congo or Zaire and of the Zambesi—if this had been done sixty or eighty years ago, doubtless many valuable lives would have been saved; but we should on the other hand have lost those narratives of courage, endurance, pluck, inventive resource, scientific observation, energy tempered by caution, firmness tempered by kindness, which never fail in stirring one's blood. There is something captivating, also, in a little tinge of mystery; so long as the great African rivers had not been traced to their true sources, they formed a mighty geographical puzzle, on which the imagination could dwell at pleasure.

We most of us know that the exploration of Africa has generally commenced on the sea-coast, from some port or ports where European consuls are stationed; and has had its goal in the interior, where black tribes have to be encountered—amicably or belligerently as the case may be. Thus, at various dates during the first half of the present century, Lichtenstein penetrated north to the Bechuana country from the Cape of Good Hope; Mungo Park, having formed an opinion that the Niger and the Congo were outlets of the same river, made his second journey, which ended fatally; Burckhardt made many discoveries in the north-west regions of Africa; Clapperton and Denham penetrated from the Mediterranean coast to Soudan, across the whole breadth of the frightful Sahara;

while Richard and John Lander traced the Niger to the Gulf of Benin.

What may perhaps be regarded as the modern series of African explorations, penetrating quite to the heart of the continent near the equator, commenced about thirty years ago. The heroic David Livingstone began his good work at that time. Tramping inland from the Cape of Good Hope, or from the mouth of the Zambesi in the Mozambique district, he discovered Lake Ngami; then a vast range of new country between the Zambesi and the west coast at Loando; and then reached the beautiful Lake Tanganyika. What he underwent during all these years of exhausting labour, his published narratives tell full well. Even four years before his death, he spoke thus of his troubles when crossing the swollen streams that flow into Tanganyika: 'Only four of my attendants have come here; the others on various pretences absconded. The fact is, they are all tired of this everlasting tramping; and so verily am I. Were it not for an inveterate dislike to give in to difficulties without doing my utmost to overcome them, I would abscond too.' There spoke the man, in his true dauntless character. The readers of the *Journal* will not need now to be told that this indefatigable traveller kept on his noble work until nature could hold out no longer, and at length breathed his last in May 1873, watched by two faithful native attendants. Before and since the date just named, explorers in remarkable number have penetrated Africa in all directions: sometimes to assist in searching for Livingstone (whose absence was prolonged for many years), sometimes for independent objects of discovery, sometimes to assist the Khedive of Egypt in conquering tribes in the interior. The names of Speke, Grant, Burton, Baker, Stanley have become almost household words with us. We know how, among them, they have discovered the two magnificent equatorial lakes, Victoria Nyanza and Albert Nyanza: we know how clearly they have traced up the sources of the Nile to these lakes, and how much they desired to know whether Lake Tanganyika (extending eight or nine degrees south of the equator) is part of the same system, or whether it belongs to a different river-basin. Not the least remarkable of these expeditions were the two conducted by Mr Stanley, supported entirely on funds liberally supplied by the proprietors of two newspapers, the *New York Herald* and the *Daily Telegraph*.

What those gallant men underwent, in combating heat, drought, swampy damp, ague, fever, dysentery, robbery, violence, fatigue, hunger, can only be fully known to themselves; but most readers have picked up some knowledge on the subject from the ample published narratives. Who, for instance, that has read the story, can forget the wonderful journey of Lady Baker to the central lakes? Rather than leave her husband to travel on without her succour and companionship, she went through perils and discomforts which women of delicate nurture can hardly conceive. Both stricken down with fever at one time, he on one pallet and she on another, husband and wife were left to the mercy of native blacks, with not a white man within any attainable distance; and yet both

lived to return to England in good health. We all recollect what tough work Mr Stanley had to go through in his search for Livingstone, and in the conveyance of much-needed stores for that illustrious traveller. Many of us are familiar with his second journey in 1874-75, made when aid was no longer available for poor Livingstone, and for the express purpose of making a thorough examination of the noble Victoria Nyanza. We know that he started from the coast at Zanzibar with three hundred men; that while he was absent two months from camp, making the tour of the lake in his boat *Lady Alice*, most of his men were obliged to fight the natives; and that the number, by fighting and disease, was lessened nearly one half. Stanley, it seems now probable, has definitely settled that the affluents of the Victoria are the most remote sources of the mysterious Nile. He also found favour with one M'tesa, king or chief of Uganda, a fertile country on the north-east shore of the great lake. M'tesa is not a black potentate; he is a Muscat Arab with a little African blood in him; and Mr Stanley thinks there may be a great future for commercial and civilising enterprise if he be approached in a proper spirit. One word concerning another explorer, Mr Young, who is at this present time journeying towards Lake Nyassa, or around its shores. An Association has subscribed no less a sum than twelve thousand pounds for founding a missionary establishment to be called 'Livingstonia,' to perpetuate the name and fame of the great explorer. Mr E. D. Young is manager of the expedition. In a letter recently received in England from him, he describes one of those mishaps which are so plentiful in Africa. While going up the Zambesi in August last, his boat was upset, and two of his native crew drowned. 'In addition to this, the greater part of our personal luggage was lost; I myself lost everything in the shape of clothes; also many things I was taking out from friends to natives on the lake. I don't at present know how to get more; so I suppose I shall have to make a suit out of my blanket to serve me day and night. I shall feel the loss of my boots and socks most.' We must remember that such losses are almost irreparable in such a region.

These preliminary remarks on the general character of African exploration, during a long course of years, are necessary to a due appreciation of the relation which the young officer who will be our hero at present bears to the rest of the noble band.

Lieutenant Verney Lovett Cameron, son of the vicar of a parish near Sevenoaks, in Kent, was born in 1844. He entered the royal navy as a boy cadet at the age of thirteen, and has seen an unusual amount of busy life as a young man; for it will be noted that he is only now in his two-and-thirtieth year. He worked himself up from cadet to midshipman, from that to sub-lieutenant, and then to lieutenant. He applied himself so sedulously to his studies that he obtained first-class honours in nearly all—mathematics, science, surveying, navigation, seamanship, gunnery. These matters held him in good stead in his recent expedition, which was as noteworthy for scientific observations as for personal enterprise and judgment. He served successively, in one capacity or other, in the *Illustrious*, the *Victor Emmanuel*, the *Defence*, the *Hector*, the *Terrible*, and the *Star*. As first lieutenant during the Abyssinian War, he

was engaged in surveying; buoying, and beacon-lighting in the Red Sea; then in helping to save the crew of the United States corvette *Sacramento*, wrecked off the mouth of the Godavery; and then in boat-cruising on the east coast of Africa, searching out and hunting down the slave dhows.

It was the horror felt at the dreadful scenes witnessed that gave him a yearning to assist, if possible, in putting down the iniquitous slave-trade of the interior. The Royal Geographical Society, so honourably distinguished for lending a fostering hand to exploration all over the world, determined in 1872 to send out supplies to Livingstone, whose isolated position and scantiness of stores had become subjects of much anxiety in England. Lieutenant Cameron gladly undertook the command of the expedition; and it is a matter of congratulation to all that he accepted the responsibility. His outfit was large and well selected, comprising necessities for the large number of men who would constitute his party, presents to conciliate chieftains on the way, and stores to hand over to Livingstone, if happily met with. Sir Bartle Frere rendered most valuable aid in these preliminary operations, by his extensive knowledge of Arab and other nationalities.

Lieutenant Cameron was accompanied from England by Mr Dillon; at Aden they were joined by Mr Murphy, of the Royal Artillery; and at Zanzibar by Mr Moffat, Livingstone's nephew, who eagerly threw up a post in Cape Town to join in the enterprise. After surmounting many difficulties on the coast, in hiring native porters, purchasing various supplies, &c., they started for the interior. Mr Murphy, stricken down with fever at Zanzibar, was left under the kind care of French missionaries at that place. Cameron followed nearly the same route as had been taken by Stanley, and several years earlier by Burton. When they reached Unanyembe, in August 1873, Cameron and Dillon were for a time prostrated with fever; and Murphy, who had dragged himself after them, was ill also. It was while at this town, between Zanzibar and Lake Tanganyika, that news reached them of the death of poor Livingstone, which sad event had taken place about three months before. Cameron at once sent on some stores to assist in the conveying of Livingstone's body to the coast. Here was a sudden check to the plans; Moffat, Dillon, and Murphy had now no Livingstone to aid; and they returned to the coast so shattered in health that two of them sank under their accumulated maladies. Not so their energetic commander; he resolved to attempt the exploration of the immense range of country lying between Lake Tanganyika and the Atlantic Ocean.

It is hard work for a reader of average intelligence, making no pretence to minute knowledge of geographical details, to remember the names of the rivers and lakes of Central Africa. The successive discoveries by Grant, Speke, Burton, Baker, Livingstone, Stanley, Cameron, &c., have made us pretty familiar with the four fine lakes Nyassa, Tanganyika, Victoria Nyanza, and Albert Nyanza; but until the maps become better filled than they can at present be with well-authenticated laying-down of places, the river-names, such as Zambesi, Lukuga, Lualaba, Luapula, Kirumbwe, &c., will be a puzzle to many of us. Nor will we be less puzzled with the names of the minor

lakes, such as Kassali, Lohemba, Kattara, Bembe, Ziwanbo, and the like. The letter U is very largely employed as an initial in the names of districts, towns, rivers, and lakes—especially districts and towns. It is possibly some peculiar guttural pronunciation of the names by the natives that has led our explorers to adopt such spelling as Uvuna, Uziri, Ukafu, Ulagalla, Unanyembe, &c.

Cameron, parting from his English companions, after well providing them with stores, pushed on to Ujiji, on the east shore of Lake Tanganyika. There he found some note-books and sketch-maps left by poor Livingstone; these, as may well be supposed, he religiously preserved. Commencing a two months' exploration of the lake, he applied to an admirable purpose the practical knowledge he had obtained of astronomical observing and land-surveying. His predecessors had found many rivers flowing into the lake; but Burton, Speke, and Livingstone had alike failed in finding one flowing out of it. Cameron was more fortunate; he entered an affluent (or rather effluent) on the west shore of the lake; and was thus led to his grand discovery, that Tanganyika sends its waters to the Atlantic, leaving to the Victoria Nyanza and Albert Nyanza the honour of being the headwaters of the Nile, flowing into the Mediterranean. His accurate observations told him clearly that Tanganyika is at a much lower level than the other two lakes, thereby precluding the possibility of its waters flowing into them.

How the young officer tramped on from Lake Tanganyika to the Atlantic, never flinching till he finished that great work in November last, we shall tell in our next article.

IZAAK WALTON.

On the 9th of August 1593, was born at Shallowford near Stafford, Izaak Walton, the author of that charming book, the *Compleat Angler*. Little is known of his history. He is first found keeping a small linen-draper's shop in the Royal Exchange, London. Thence, after various vicissitudes, he retired to his native place. Gifted with a poetic fancy, and being a keen lover of rural sports, the leisure he now enjoyed enabled him to impart to others a sense of the enjoyment he himself felt in his favourite pastime of angling. Accordingly, in 1653 appeared the *Compleat Angler*, or the *Contemplative Man's Recreation*, a book which, according to Hallam, 'has never since been rivalled in grace, humour, and invention.' The work on its first appearance at once secured the public heart, and still continues to be one of the most popular of the English classics. Though by no means the first writer upon piscatorial subjects, Walton happily intermingled his precepts on the art of angling with lofty yet cheerful morality, and a wealth of fancy which, as applied to the subject, has never been surpassed. Prior to him, Dame Juliana Berners, Gervase Markham, and notably Thomas Barker, Walton's own instructor in fishing, had written on the gentle art, and their books were always popular; but they have none of them retained public favour, as has 'old Izaak.' He and Cotton (who added a second part to the *Compleat Angler* in the fifth edition of the book) are looked up to at present,

as they have been for generations, by all anglers as their tutelary deities, the Gemini of the angling zodiac. Walton seems to have known as little of fly-fishing as he did of salmon-fishing; therefore, Cotton, who resided on the Dove, and had a long experience in all that relates to fly-fishing, the crown of the angler's art, supplied the deficiency. His portion is pitched in a much lower key, whether of moral purpose or imaginative power, but very fairly continues the plan on which his great master had worked.

The first edition of Walton appeared in 1653, since which time the *Compleat Angler* has been reprinted in every size and form, from that suited to the waistcoat pocket, up to Pickering's magnificent edition, illustrated by Stothard. It has, moreover, been furnished with notes, appendices, elucidations, and the like, by numberless anglers and book-makers, overlaid with abundance of details, which have often well-nigh smothered the text. Mr Westwood, writing in 1864, enumerates fifty-three editions of the book—one in rather more than every three years of its life, which speaks volumes for its popularity. At length, to satisfy the curious, there has been produced by Elliot Stock, a London publisher, a fac-simile reprint of the original work. This book, coated in old-fashioned binding, and containing the original engraved plates of fish, struck off by a novel application of photography, is a bibliophilist's delight in every particular. Even the curious red and blue sprinkling of the edges is conformed to that of Walton's original edition. With this book in his pocket, the angler can recline under the pollards at noon-day, while eating his frugal meal, and at once transport himself two hundred years back into the time of the Cavaliers and Puritans.

Few books have suffered so complete a change of form, and survived so many additions without losing their first fragrance, as has this. The *Compleat Angler* on its original entry into the world consisted of two hundred and forty-six pages, or thirteen chapters, clad in modest brown calf, and illustrated by half-a-dozen admirably engraved plates of fish. These were indeed said, but it is thought without any foundation for the assertion, to have been engraved on plates of silver. All these plates, and the due number of pages, even down to bad spellings and the like, are faithfully reproduced in this quaint little fac-simile, of 1876. It tells us, as the original charged its readers, that 'fishers must not rangle,' nor 'be nice to fowl their fingers;' and it reprints the curious music of the angler's song (treble being one way down the page, and base looking in the opposite direction, to enable two people to sing from the same book), which is by Mr Henry Lawes, a name that at once recalls *Comus* to the scholar. Lawes composed its music, and is himself celebrated in it as one

Who with his soft pipe and smooth-dittied song,
Well knows to still the wild winds when they roar,
And hush the waving woods.

Walton all but re-wrote the book in the second edition, adding a third (one hundred and ninety pages, according to Westwood's *Bibliotheca Piscatoria*) to it, and four new plates of fishes. Viator, the disciple of the first edition, now becomes Venator the hunter; and Auceps (the fowler) is a new creation, which enables Walton to introduce

some of the most exquisite passages of his book on the nightingale, skylark, and other birds. Thus, the book as known at present consists of twenty-one chapters; and the whole process of dove-tailing and tacking on of additions is a singular instance of a good book being used as the germ of a second edition, and not spoilt in the operation.

This fac-simile of the first edition of the *Compleat Angler*, therefore, is 'welcome, as is the spring to the earth,' to the angler, partly because of its own intrinsic interest; and partly from its curiosity, as being the subject of so complete a bibliographical transformation. We frankly confess that it is mainly for the former reason that we love the yellow pages with their ample margins and slender river of print flowing down them. It yields a keen pleasure to reflect how many simple, kindly anglers have blessed the good old man who gave them such pious, yet interesting dialogues, taught them thankful contentment, and instilled amidst the most charming country scenes the principles of so soothing an art. And the quaintly printed pages are still fragrant with these memories, and with many an injunction to virtue; they recall many a name famous in the annals of the nation, they bring back past generations which delighted in the pure and peaceable wisdom of the book, just as so many quiet reflective minds do at present. There is a peculiar charm, therefore, in reading in this fac-simile (if we are not lucky enough to possess the original) of the delights of the beggar's life in summer, which is only equalled by the angler's happiness; we shelter with Piscator under the sycamore tree 'while it rains May-lutter,' or listen while 'pretty Maudlin' sings the Hunting in *Cherry Chase*, or some other good ballad, and afterwards gives us 'a draught of the red cow's milk.' Or we resort to 'the good, honest alehouse' with the little party, refresh ourselves with a cup of ale, and play at shovel-board with them through the hot afternoon. The Thatched House too and Trout Hall are not left unvisited by fancy while we peruse this magical book, fraught with so many old-world associations, and in either of these nooks we 'can sing away all sad thoughts;' there will be 'lavender in the windows, and twenty ballads stuck about the wall.'

But the fascinating pages must be laid down, or we shall presently be compelled to take rod and pannier and seek the nearest stream. And here is, after all, the great secret of Walton's popularity. He calls men away from contracted views of human life, and philosophies smelling of the lamp, to the open air of heaven, and the simple pleasure that lies in homely English fields and rivers. And yet it would be a great mistake to suppose that the *Compleat Angler* is solely a book for fishermen. It could never have survived the deadness of the last century, had it been no more than an anglers' primer. The characteristic touches of literary art which stud its pages, and the many beauties of its style, will engage the attention of any reader who is fond of his native language; while the sentiments of unaffected piety which breathe through it, as the soft south wind would blow over Walton's favourite Shawford Brook, must always insure it a place near the contented man's heart. If our readers are ignorant of this little book, we are persuaded they will thank us for introducing it to their notice. 'In the mean time,' to conclude with

Walton's last words, 'the blessing of Saint Peter's Master be with mine, and the like be upon my honest scholar. And upon all that hate contentions, and love quietnesse, and vertue, and Angling.'

A PASTORAL SONG.

The following beautiful lyric was written by William Hamilton of Bangour, a Scottish gentleman, born of an ancient Ayrshire family, in 1704. In 1745 Hamilton joined the standard of Prince Charles, and became 'volunteer laureate' of the Jacobites.

Ye shepherds of this pleasant vale,
Where Yarrow streams along,
Forsake your rural toils, and join
In my triumphant song.

She grants, she yields; one heavenly smile
Atones her long delays,
One happy minute crowns the pains
Of many suffering days.

Raise, raise the victor notes of joy;
These suffering days are o'er;
Love satiates now his boundless wish
From Beauty's boundless store:

No doubtful hopes, no anxious fears,
This rising calm destroy;
Now every prospect smiles around,
All opening into joy.

The sun with double lustre shone
That dear consenting hour,
Brightened each hill, and o'er each vale
New coloured every flower:

The gales their gentle sighs withheld,
No leaf was seen to move,
The hovering songsters round were mute,
And wonder hushed the grove.

The hills and dales no more resound
The lambskins' tender cry;
Without one murmur Yarrow stole
In diaphanous silence by:

All Nature seemed in still repose
Her voice alone to hear,
That gently rolled the tuneful wave,
She spoke and blessed my ear.

Take, take whate'er of bliss or joy
You fondly fancy mine;
Whate'er of joy or bliss I boast,
Love renders wholly thine:

The woods struck up to the soft gale,
The leaves were seen to move,
The feathered choir resumed their voice,
And wonder filled the grove;

The hills and dales again resound
The lambskins' tender cry,
With all his murmurs Yarrow trilled
The song of triumph by;

Above, beneath, around, all on
Was verdure, beauty, song;
I snatched her to my trembling breast,
All Nature joyed along.

COUNTRY RAMBLES.

EYES AND NO EYES.

To how many people is it said: 'You should take exercise. Be in the open air as much as possible.' And day after day the prescribed walk is taken, perhaps along a straight road devoid of interest; or across a heath or common where the only enjoyment is that of the fresh air which fans the cheek and raises the spirits of all alike, whether the pedestrian be he who asks 'whence it comes and whither it goeth,' or one of the many who concern themselves but little about Nature and her workings, and are content to go through the world blind to her attractions. Some interest in the external world as seen in the country, or even in towns and their suburbs, is essential, if we wish to get the full benefit of the exercise now recognised as an important part of every prescription for health. To walk through a country lane or even a suburban park in the early spring-time, with a mind incapable of being diverted from the ordinary cares of life by natural surroundings, is to lose health as well as pleasure; and it is with a view of pointing out some of the objects most worth attention and thought, that we would endeavour to add something like a charm to the prescription of the physician, and also to the ramblings of those who, unconscious of the search for health, are on the right road to preserve it.

It seems almost as if early life and early associations had more to do with the love of Nature than with any other sentiment of the mind. Children from their very infancy love flowers, and plants, and animals. We could tell tales of the childhood of men now professors of natural science in our universities, in which three pet slow-worms, a couple of large toads, and a kitten, formed a conspicuous feature. But if we commit our children in their daily walks utterly and entirely to the guidance and care of an ignorant nursemaid, who regards all wild-flowers as 'rub-bish,' and lizards and worms as 'poisonous beasts,' what can we expect? The late Professor Henslowe of Cambridge was not only Professor of Botany in

the university, but he had a country living at Hitcham, and a village school in which he took much interest. He had a botanical class for the elder girls in the school, and encouraged all who would learn, to gain an acquaintance with the plants of the district. He got them to gather and collect the flowers growing in the fields or by the wayside on the road to school, and gave prizes for such as secured the greatest variety of a certain genus of plants or made the best dried collection. By teaching them to observe correctly, he sharpened all their perceptive faculties; and the inspector of schools reported that this school was far above the average in the district in every respect—the only novel feature in its arrangements being the introduction of botany as a study. The practical utility of this was soon found out, for the neighbouring families were only too anxious to secure nursemaids from amongst these village botanists; and we know that many a long walk has been beguiled, and many a weary hour in the nursery improved, by the collection, arrangement, and drying of the flowers of a district, and a refined and cultivated taste excited in very early life, which would never have been roused but for the efforts of the good professor in his Suffolk village school.

It is true that the inhabitants of towns are greatly debarred from making very intimate acquaintance with the 'beauties that Flora displays,' but there are few who do not at times take to the open country; and the parks, gardens, and museums of our towns are now so numerous as to supply the best means of education and training for those who intend hereafter to make collections for themselves. An intelligent governess or mother in the daily walk with the little ones will find the names of nearly all the chief trees of our parks and public gardens plainly inscribed on their respective tablets; and these, when once learned, add greatly to the interest of a country walk, or even to the study of a picture or gallery of pictures. How few artists give to our common trees their true and distinguishing characteristics, and until lately how still fewer thought it worth while to represent

vegetation correctly. We have seen a picture with pears on the trees, and primroses blossoming on the bank below; a sight never beheld in nature. Much has been done by the Pre-Raphaelite school of artists to check these errors, and Nature is more fairly dealt with now in our picture-galleries than she used to be.

To those who are obliged to spend a great part of their lives in cities we would say: Use the means at your command to understand that which possibly may only please your country-cousin, who admires with wonder, but does not go any further. You have ready-made collections in the great metropolitan and local museums waiting for you to study. And we well know how great an assistance it is, during the patient study of any one particular subject in natural science, to walk into a museum, and there find endless illustrations of what we have tried to understand, whether it be the form of an animal, the colour of a flower, or the arrangement of the geological strata of any part of the British Isles.

It is an excellent thing to encourage children to collect what they see and can pick up in their walks, and to arrange and learn the nature of their treasures, at home. A little cabinet or simple chest of small drawers is an endless source of instructive pleasure, for here can be neatly deposited the flowers gathered in the country excursion—classified and named—in one drawer; in another, shells and stones preserved since the last sea-side visit; and perhaps also the very roadside flints, broken open by a hammer, shewing the nature of their formation, and in the centre the nucleus of a shell or petrified sponge around which the flint has been deposited. We know that such a simple collection as this has given the impetus necessary to make a naturalist; and that where pence and shillings would have been spent by the ordinary schoolboy in tarts and sweetmeats, and perhaps tobacco, the child whose tastes are thus directed, prefers to buy a rare sea-bird's egg for his collection, or to take a trip to a neighbouring quarry, hammer in hand, to see what treasures he can find for his museum. Well for him if he have an intelligent friend at hand to explain many things to be met with in his country rambles. If not, he must grope about for himself; and with a choice of the very many inexpensive manuals now to be obtained, he may soon find out the names and classes of his plants, and learn how to dry and arrange and name them so as to form an herbarium. Then, if he have a little collection of butterflies, moths, and other insects, he soon identifies them from drawings, description, or from the specimens in the town museum; and it is a work of interest to negotiate exchanges of different specimens with other collectors.

With what pleasure will a youth, thus prepared to enjoy what is to be found in the woods and fields, look forward to his country excursions, even if they be only for a day at a time! We will imagine it spring-time in one of the English counties—not such a spring as that we have been

enduring, but a bright genial old-fashioned spring, when the leaves on every tree seem to contrast with the dark lines of the stems which support them, and the delicate fresh untarnished green is so refreshing to the eye, that we gaze in peaceful admiration without asking what tree it may be that looks so lovely. The eye passes on; and the next mass of foliage that arrests it is so different in character, that we recall our early lessons, and recognise one as the waving ash, and the other as the stately horse-chestnut tree. Yes, there are the beautiful rosy-tipped spikes of snowy blossom! We reach up and gather a spray, and recollect that this is the tree which forms one of the most magnificent objects in an English landscape; whether we see it in the spring with its wonderful buds, the best examples that a botanist can find to illustrate that stage of vegetation; or later in the year by a few weeks, when it looks as if decked with lamps for some gala or jubilee, with its superb hyacinth-like pyramids of white blossoms flushed, like sea-shells, with pink and yellow. In the autumn, when the ground is bestrewn with its large, shining, mahogany-coloured seeds, do we not all recollect how, in bygone days, we filled our pockets and pinafores with these treasures, to be carried back to the school-room or nursery; and how annoying it was to find that they were not good to eat!

'Seeds, are these?' says the little one whose pinafore is full. 'Tell me about them. How do they grow? Are they like the seeds we plant in the garden? Will they grow into a great tree like this one?'

Well for the child if these questions can be simply answered; and if the nature of seed, its manner of growth and the whole process of germination, be illustrated, as it easily may be, by a saucer full of the commonest seeds covered with water—which may be changed occasionally, and left for ten days or so—till the little embryo begins to shew, and the internal economy of a seed is rendered evident even to a child's eye.

In our rambles we very soon find that the plants and even the animals vary according to position; whether we seek for them in the woods and hedges, the open fields, by the river-side, on rocks and walls, in waste places, in bogs and marshes, on bleak wild commons, by the side of the mountain, or on the sea-shore. Each has its locality; and it is interesting to observe how seldom they leave their homes to settle elsewhere. The nature of the soil often determines the habitation of a plant, and the student of botany can scarcely fail to learn something of geology also. When we see that a plant which flourishes on a chalk cliff, withers and dies when transplanted to the rich soil of an alluvial valley, we begin to ask, how these different strata were formed; how is it that in one field we see huge flints lying about, and lumps of chalk mixed with the soil, and in another, perhaps not many miles off, such a thing as a flint is not to be found in the red dry sand which covers the land? For instance, that pretty blue butterfly is found nowhere off the chalk. We know it as the *Chalk Hill Blue*. It is found chiefly in the south of England—never in Scotland, and settles on plants such as the vetch, the bird's-foot trefoil, &c., where in its chrysalis state it had fed.

But if we go in for butterfly-hunting, we could fill a volume with an account of adventures—of

hair-breadth escapes when 'sugaring for moths,' as the boys call it—that is, spreading sugar or treacle and water on the trees and hedges of a country lane, and then going out after dark with a lantern to capture the unwary insects, attracted by the sweet meal prepared for them. Well can we recollect being seized by a coast-guard, and roughly stopped with our shining lantern, when moth-hunting one dark night on the Suffolk coast. We never quite understood, in our fright, whether he said our light would mislead the ships at sea, or whether he took us for smugglers. We nearly fell over the cliff ourselves in our terror, and left the moths to enjoy their sweets undisturbed in that district for the future. There is skill even in butterfly-hunting, and great excitement prevails amongst collectors when rare species are secured uninjured, and carefully mounted and preserved. The Purple Emperor is perhaps the most magnificent of British butterflies. He is renowned for his extensive flight, and almost invariably fixes his throne on the summit of a lofty oak, from the utmost sprigs of which, on fine sunny days, he sets out on his aerial excursions. He is not imperial in anything but his attire, for his tastes as to food are of the most depraved description. Those who have been most successful in capturing Purple Emperors tell us that they have had to take up their station near any dead garbage in the neighbourhood; and one collector says that on a scorching day in July he had the satisfaction of securing three Purple Emperors, who descended from their thrones to breakfast on dead stots and weasels, which had been hung in some bushes as a terror to evil-doers. The head of a dead cat nailed to a door attracted as many; and it must be acknowledged that the poetic idea of butterflies sipping nectar from the flowers, and drinking in ambrosial honey, was sadly dispelled by the sight and smell of the dainties chosen by this imperial palate.

Our chat on a butterfly has drifted us into the summer, and we think that perhaps no suggestions of ours are necessary to render a fine bright summer's day in the country enjoyable, even to a blind man. The very sounds that meet the ear as we sit on a bank by the wayside are full of sweetness; and we think, even to those who cannot see, that it must add to the pleasure of the hour to recognise the songs of birds and the sounds of insects. But the eyes that can see and yet convey no pleasurable impressions to a brain, do not fulfil all their functions, and we recall the tale of our childhood, 'Eyes and no Eyes,' and feel thankful that, by reason of the patient teaching and example of a dear naturalist friend who has finished his work here, we can see, and that we now can help others to see likewise.

The early summer-time is a very enjoyable season for a country ramble; and to many a boy the ramble is not complete unless he discovers birds' nests. But birds' eggs—so much coveted by school-boys—should be very clearly taken, or where is our concert when the spring-time shall again come? And on this we would offer a piece of kindly admonition; if the object really be to make a collection of British eggs, we think the good mother-bird would give one of her eggs, if asked. We would plead that the nest be untouched, and but one egg taken from it. By this means no harm is done, and the mother-bird does not miss

the stolen treasure. Carefully blown, arranged on cotton-wool or in little card-boxes in a drawer of our cabinet, a tastefully selected collection of birds' eggs is very interesting and pretty.

So with butterflies and moths. We greatly deprecate the practice of capturing and wantonly destroying these beautiful creatures, simply for the sake of catching them. To complete a collection, or to study their structure, it is necessary to take them; but even then we hope that none of our readers will fail to observe gentleness and care in the operation, remembering that the struggles of a captured insect betray an organisation sensitively alive to pain. Irrespective of this condition, it has always appeared to us especially repugnant to see the delicate painted wings of a moth or butterfly heedlessly crushed and mutilated; and we would teach our children as much respect for this form of beauty—by many held so cheaply, because it is so abundant—as for the works of man's art, costly and difficult to obtain, but scarcely able to vie with Nature in her perfection. We know but too well how precious is this power of taking delight in what costs so little, to those who do not possess the means of attaining that which costs much. By cultivating these tastes, and giving the knowledge to our children on which to form these tastes, we are bestowing on them a gift which cannot be taken from them, and which in their maturer years will open out its full value, when perhaps many of the pleasures of young life are over, and they are left alone with Nature and the memories of the past.

But does the interest of the country walk cease when the summer is over, and the autumnal tints of autumn have disappeared? No; even the very return of winter brings its pleasures. The beautiful moss and lichens that are unobserved when verdure is luxuriant, now attract attention, and their study and collection add quite a charm to a winter excursion. The chrysalides of many moths and butterflies are found in the winter, and can be preserved and hatched the following spring. And the long evenings and wet days indoors may afford ample leisure for the arrangement of the treasures collected during the year. Each one of the subjects we have but mentioned is a study in itself, and has its special exponent and class of literature.

It has always seemed to us that botany is of all the sciences one of the easiest to study, and the best for those who cannot go far from home, or who have not large resources. True, if pursued, it leads on to other aspirations, and undoubtedly will suggest the use of the microscope, beginning with a pocket-lens, which may be purchased for half-a-crown. What instrument combines instruction and amusement more perfectly than this? But before we can use it with advantage, we must learn the full use of the unassisted eye, gaining all we can from its intelligent use, and we are then able to welcome the aid of the artificial eye of the microscope. What eyes would be to a blind man, the microscope is to the unassisted vision; and we think the eyes of those who have trained and educated their observing faculties, are almost as different from the eyes of those who have never tried to see what is to be seen in the world of Nature. The more we exercise any of our senses, the sharper they become. Cannot the sailor detect a sail on the horizon when it is

invisible to the landsman, or the Eskimo an Arctic fox as it runs over snow no whiter than itself, when an unpractised eye would see nothing! So it is with the naturalist who has worked and thought carefully over the objects which surround him in this beautiful world. His senses are keener and more alive to impressions from Nature than those of other men. At a glance he can tell you the habits of an animal by looking at its jaw or its feet, or the particulars in the earth's history, of any region or plot of ground, by looking at its rocks and stones. Much is being done now in the right direction, and science is daily becoming more appreciated, not only, we hope and believe, for the vast amount of human comfort and wealth opened out by the application of her treasures, but for the genuine, pure delight to be found in her pursuit, and for the elevating and refining influence which she exerts on all her true disciples and lovers, be they ever so humble or uninstructed.

FALLEN FORTUNES.

CHAPTER XXVIII.—FAREWELLS.

THERE were other partings that would have wrung Dalton's heart, had it not been already wrung out to the very core.

Jeff, with his large black eyes filled with unaccustomed tears, had a word with him in private.

'God bless you, Mr Dalton,' faltered he; 'you have always been a good friend to me, and I am very, very sorry'—

'Never mind, my lad; all will come right with us, no doubt,' interrupted Dalton cheerfully. 'You must not give way like that, but help to keep up their spirits, now I have left them. My wife and the girls—and of course Tony—will be looking to you for that, you know.'

'Yes, yes; that is what I wished to say; for though, as I said, you have been always good to me, Mrs Dalton she I would lay down my life for Mrs Dalton!' cried the lad with energy; 'and Kitty—I love Kitty, sir.'

'And Jenny too, I hope, my lad,' said Dalton. He understood what the boy meant well enough, but his time was too short, his mind too full, to argue with him upon such a hopeless passion, which at Jeff's age, moreover, could hardly be held a serious thing.

'Yes, sir, and Jenny too; but not as I love Kitty,' continued the other with great earnestness; 'I should like you to know that, before you go.'

'Well, you shall talk to me about that, Jeff, when I come back again,' returned Dalton kindly. 'There is plenty of time before you as to that matter, and very little left for me just now. You'll keep an eye on little Tony, won't you?'

'With the help of God, I will keep my eye on all of them, and do my very best for them, Mr Dalton.'

There was a manliness about the handsome lad, as he drew himself up, as with the consciousness of the responsibility he had thus solemnly undertaken, that impressed itself upon Dalton for the first time. He had always regarded Jeff as a mere lad, and almost in the same category as Tony himself. Now he held out his hand for the other to shake, as a man holds it to his equal in age and standing. Jeff took it, and, to his infinite surprise, carried it

to his lips; then suddenly left the room—just as Holt entered it.

'I wanted to have three words with you alone, Dalton.'

'Very good, my good sir. I am quite at your service.'

Dalton had been unmanned for the instant at Jeff's unexpected manifestation of supreme regard; but at the sight of the newcomer he had become firm as a rock, and, truth to say, as hard. His dislike to Holt—though it would have been hard to say why, for the man's manner had been singularly free from offence of late, and indeed of signification of any kind—had grown within the last few days to positive hatred. He especially resented that he had been asked to stay on at Riverside, and was not about to leave it, apparently, even now.

'There is a certain subject, Dalton, which has been tacitly tabooed to both of us of late, but to which I wish to revert once again before you go.'

Dalton uttered a little sigh of relief. At the man's first words, he had grown pale and grim, apprehensive that this tabooed subject might be his daughter Kate; but as she had never been spoken of between them, it was plain that Holt could not be referring to her.

'Say what you like to me, my good sir,' said Dalton carelessly, 'since it is not likely you will have another chance for some time to come.'

'That is the very point I wish you to reconsider,' observed Holt gravely.

'What point?'

'As to your going to Brazil. I knew your mind was set upon it, and have therefore forbore to dissuade you from what I will stake my existence will be a profitless and disappointing errand. But really, after what I have seen during the last few days—or rather have felt without perceiving—for they all bear themselves like heroines of the distress and anguish your departure is causing to your family, I am compelled to make one more effort to move you from your purpose. If you had really any definite aim, if there was any positive good to be derived from such an expedition, I would be the last to deter you; indeed, as you remember, I advised your going abroad though it is true I did not then understand how deeply it would be taken to heart by those belonging to you. But now, when I see you actually starting upon this wild-goose chase, throwing the good money you have left after bad, and your wife and children'—

'Look here, Holt,' interrupted Dalton fiercely; 'my wife and children are *my* wife and children. I have little left to me, but they at least are mine. Be so good as to let me and mine alone.'

'You are very unjust and very harsh to me, Dalton,' answered the other, in quiet, almost pleading tones. 'Any man may surely be permitted to express sorrow not only for his friend, but for his friend's belongings.'

'No doubt; but you were seeking to make it the pretext of an argument. As to my going to St José, have you any new reasons to urge why I should not do so, except your own conviction of its futility?'

'Well, even that is stronger than yours is to the contrary; but I have, as it happens, new reasons: a thousand of them. I have had a telegram this very morning which authorises me to buy up your

shares in the *Lara* for a thousand pounds. I think the man is mad, but he means what he says; and I shall think you twice as mad as him, if you decline his offer. It frees you at once from all these distressing responsibilities—for that he specially undertakes to do—and puts a thousand pounds in your pocket to begin life anew with. With your talents and with my experience, what may we not gain with it! Or even if you forswear "the City," a thousand pounds is a sum to rest upon, and look about you!—

'One moment, Holt. Who offers to buy these shares?' Keen, darting suspicion was in the speaker's eye, and his tone had a harsh sharp ring as he put this inquiry.

'Let us see,' said Holt, coolly drawing out the yellow missive from his pocket: 'the people here were not on the look-out that always happens with your private wires—so it was sent over from the station. Brand telegraphs: *Mavor will take D's shares, and give one thousand pounds.*—You know Mavor: a very speculative fellow indeed.'

'Yes; but from what I remember of him, not a likely man to have a thousand pounds at his banker's, far less to be responsible for!—'

'Nay; so far, that is *my* affair,' broke in the other eagerly. 'I should not advise you to accept the offer, if I did not guarantee its being genuine. Mavor is as good as the Bank—that is my opinion; but at all events I will go bail for Mavor. Now, think of it, Dalton. Here is a reprieve, if not a pardon, come for you. Upon my life, it is scarcely less! Think of the joy that will overspread the faces of your wife and children, when they hear your intention of taking this mad journey has been abandoned. Think of this day of sorrow!—'

'No; I will not think of it,' broke in Dalton fiercely. 'This offer may be all on the square, or it may not!—'

'Dalton!'

'I was not speaking of you, Holt; or if I was, you must forgive me—I hardly know what I say. You may have made this proposal out of pure friendship and my own good; if so, I thank you for it from the bottom of my heart. But I shall stick to the *Lara*. If it is worth Mavor's while to buy, it is worth *my* while to keep; so don't let us waste breath upon the matter.'

Nevertheless, Dalton's determination had cost him a terrible struggle. He knew far better than Holt could tell him the happiness that he would have conferred upon his dear ones by a change in his resolve to leave them, even without the gilding of those thousand pounds. The thought of the weary, lonely journey before him was hateful to him in every way. But that anonymous advice, which he had just now—almost unconsciously—repeated—'Stick to the *Lara*'—combined with this new and more favourable offer to purchase his interest in it, made his suspicions stronger than ever, that some underhand agency—he knew not what nor where—was at work in connection with the Brazil mine, which was only to be detected by personal investigation. These misgivings, however, were certainly of the vaguest kind, nor had he a shadow of reason for supposing Holt to be implicated in the matter. The man's behaviour under the circumstances had been really generous; and his own rejection of his help had been cold and thankless, if not absolutely offensive. Yet Holt shewed no sign of irritation; when he saw

all argument was vain, he only observed simply: 'A wilful man will have his way.'

'Perhaps he is really sorry for me,' thought Dalton remorsefully; and he shook hands with his quondam friend, and almost partner, with a heartiness of which he had not thought himself capable in respect to him.

'You have intrusted me with no good offices in your absence, Dalton; but I hope to be of use to you, nevertheless,' said the other gently. 'If he had offered, as usual, to be "useful to him and his," Dalton would perhaps have resented it, as he had done before; but as it was, he thanked him with some warmth. 'Still, you give me nothing to do for you,' urged Holt with unexpected persistence. 'If you should want money!—'

'I have made arrangements for that,' interrupted Dalton hastily. 'My old friend Campden has kindly offered to be my banker; and here he is.'

As he entered, Holt withdrew from the library, in which Dalton was holding a sort of farewell levee.

'I don't know what to make of that man, George,' observed he, as the book-door closed behind his previous visitor. 'Sometimes I think him little better than a scoundrel; sometimes I credit him with good intentions.'

'My wife has rather cottoned to the fellow of late,' replied Mr Campden, 'and owns she used to judge him harshly. Now, for her to confess she has been in the wrong, is rather!—'

'A portent,' answered Dalton, smiling. 'Well, it shews at all events there is something in the fellow. I really don't know whether it is good or bad. He was just now offering to lend me money; but I told him that, while I was away, you had kindly given me permission to draw on you.'

'Well, yes, my dear fellow,' hesitated Mr Campden, 'I believe I did! His honest face had become crimson; he hitched at his neckcloth, and pulled at his shirt-cuffs—'shooting his linen' is the technical phrase for that form of nervousness in evidently dire distress of mind. 'But the fact is, one doesn't much like being drawn upon.'

'What on earth do you mean, Campden?' answered the other, growing very white.

'Well, of course you are welcome to the money, my dear fellow—any amount of it that I *can* get at. Here's a couple of hundreds in fivers, which—Well, that's the only way I can do it, John: and that's the long and short of it.' And Mr Campden took out his handkerchief and wiped his forehead, which was bedewed with a cold perspiration.

'I see,' said Dalton coldly; 'your wife will not let you.'

'That's it, my good friend,' answered the other, with a gush of thankfulness that the worst had now been said. 'She doesn't like my being drawn upon: bills and so on always frighten her, because she doesn't understand them. And she has made me promise that, not even in your case, don't you see! It is very foolish of her, of course; but then they all are such fools—that is, all except your wife. She would trust a fellow to any extent.'

Dalton groaned, for had she not trusted *him*, and to her cost. His friend, however, mistook the cause of his dejection.

'I know it must seem deuced hard. The idea of my not giving you power to draw on me is simply ridiculous; and scurvy too—at least it

would have been if I had objected to it myself. I am quite ashamed to go back from my word in this way. But some wives make such a row—yours never does, bless her—that one is obliged to give way. But you understand you can have the money.'

'I quite understand, Campden; but I don't want the money, thank you.'

Dalton was both hurt and indignant. He knew it was very natural that his henpecked friend should have given in to his wife's importunity and virulence against him (Dalton); but he was irritated that Mrs Campden should know that he had accepted her husband's offer as to the bill-drawing, or that any such offer had been made. What right had any man to do a kindness and then go and boast of it—or excuse himself for it, it was all one—to his wife! At such a moment, it was perhaps natural in him to exaggerate the importance of his own affairs; to consider that, under the circumstances, no matter what was his friend's domestic thralldom, that little favour—or rather the promise of it, if any necessity should arise—might have been kept private between them.

'Now don't let us part like this, Dalton!' cried the other earnestly. 'It is only the form, and not the thing, that is changed; and you know I am not changed.'

'A man and his wife are one,' answered Dalton; 'very much one, it seems, in this case, since you think it necessary to tell her every trumpery thing!'

'My good fellow, to tell you the honest truth, I could not have got the money without it,' interrupted Campden desperately. 'You don't know—you can't understand: she is a very good woman in her way, is Julia, and I know you won't say anything against her,' answered he hurriedly; 'but sometimes she *will* take the bit between her teeth.'

'And then she runs away with all your money, does she?' said Dalton, unable to repress a smile. He was still angry, but only against this woman; for his friend he now felt only pity mingled largely with contempt. We rarely make allowance for other people's weaknesses, although we have such excellent excuses for our own.

'Well, I must confess she keeps me rather short,' said Campden ruefully.

'Come to Brazil with me!' cried Dalton. It was a sneer equal to a folio of disclaim, and the next moment he was sorry for it.

'No, old fellow, I can't do that,' returned his friend good-naturedly. 'We have all to put up with something, and I know many better men in far worse case than I—you yourself, for instance.'

'I seem to myself to be the worst-used man in the world,' answered Dalton frankly. 'Let that be my apology, if I have spoken harshly. Good-bye, old friend.'

'Good-bye, John.'

And although a something had been interposed that day between their friendship, which was never removed, they shook hands with genuine feeling.

Mrs Campden and Mary came in to bid their guest farewell together. The former averred to her husband that she 'could not trust herself' to wish that man good-bye, alone, 'without giving him a piece of her mind as to his past conduct (that is, in ruining his family), as well as some

warning as to the future; but as a matter of fact, she was afraid of Dalton. If she had known what her 'George' had been just confessing, she would have been much more afraid. However, Dalton's manner towards his hostess was studiously polite, and Mary's presence saved them from any possible embarrassment. He was a genuine favourite with the young lady, and she was very 'gushing' upon his departure, and about the care she meant to take of his dear girls when he was gone.

'We shall be quite near neighbours to them, remember, Mr Dalton,' remarked her mother, as though he were likely to forget the Nook's locality. She was very nervous, and said little beyond that, except her parting speech, which was commonplace enough, and yet, under the circumstances, not a little peculiar.

'Well, good-bye, Mr Dalton, and I hope you'll enjoy yourself.' As though, in place of a voyage to Brazil, he were going to 'spend a happy day' at Rosherville Gardens, as Dalton described it afterwards.

But the truth is that, difficult as it is to find fit words to say to a man we dislike, when we meet him, it is much more difficult to do the like when we part from him, and especially if the occasion is a sentimental one.

We need not describe the leave-taking between Dalton and his own belongings, indeed there was little said on either side; for their hearts were too full for speech. To Edith, as we have mentioned, he had already bidden good-bye; but now, finding, though the carriage was at the door, that he had still a few minutes to spare, a longing seized him to see her once again. He rushed up-stairs, and hastily entered the room; but she heard him not. She was kneeling down by the bedside with her back towards him, and her face shut within her hands.

'Protect him, and bring him back to my dear ones,' he heard her praying, in earnest, passionate tones. Deeply moved, he hesitated a moment, and then softly withdrew. He would not interrupt that rapt communion between his wife and her God. Why had she said 'to my dear ones,' and not 'to me?' he wondered; but presently set it down to her freedom from the thought of 'self,' which might not intrude even in her prayers. For once he did her more than justice; it was not unselfishness that had dictated Edith's words. She had had such warnings in the way of physical weakness, that she had given up all hopes of his return to her; she was not imploring Heaven for a miracle; but only that her children should not be left in a world that no longer smiled upon them, without one parent.

A NEW WORLD IN CENTRAL AFRICA.

IN TWO PARTS.—PART II.

WHEN Lieutenant Cameron had finished his exploration of Lake Tanganyika, he started from Ujiji in May 1874, and between that date and November 1875 made his wonderful tramp to the Atlantic, through regions in most parts of which the foot of white man had never trodden. He was fortunate enough to be well received by King Kasonga, whom he ascertained to be the most powerful native chief in that part of Africa. When the narrative of his travels appears, written by his own hand, it will perhaps be illustrated with

drawings from his own pencil; but meanwhile it is pleasant to know that some of his sketches have been sent to the *Illustrated London News*, and have been engraved in the pages of that periodical.

These sketches are valuable, inasmuch as they give an insight into the manners and customs of a nation now introduced to us for the first time. In one we see the dress levée of King Kasonga of Urua, when he formally received Lieutenant Cameron. Lesser chiefs prostrated themselves before the great man, each giving his dagger or short sword to be held by an attendant. The official executioner, with axe in hand, stood ready for immediate work. Kasonga wore a European dress-coat, purchased from traders on the west coast, and a shirt, but no trousers! A long straight feather was stuck in the top-knot of his twisted hair. Two Amazons of his body-guard, in very airy costume, and armed each with an axe, stood near him; like the king of Dahomey, he has a penchant for a guard of lady-soldiers. All, men and women alike, had droll little apologies for pig-tails at the back of the head. On another occasion, Cameron met a native wedding-party. The dusky bride was lifted as high as possible on the shoulders of a stalwart man, and upheld there by another; they jumped or danced about in a grotesque way, to the music of a kind of kettle-drum thumped with the fist, and a sort of double pipe (such as has been known in Africa and the East ever since the old classical days). The assembled friends shewed the bride to the bridegroom, and congratulated him on the occasion. The costumes well, there was not much to speak of. A third sketch presents to us a Urua medicine-man, peripatetic doctor, or conjuring priest, clad in grotesque pomp of attire, with his implements of mystification, and followed by his servitors.

King Kasonga appears to be a good sort of fellow, as African princes go; nevertheless, he does a little more in slave-catching and slave-trading than is creditable. All our travellers in these African regions, however, agree that the Arab and Portuguese dealers—the former hailing from the east coast and the latter from the west—intensify the evil by encouraging it; and Cameron speaks of a certain Portuguese half-caste named Coimbra as being the worst of the lot. The lieutenant met a slave-gang of fifty or sixty wretched women, bearing on their heads heavy loads of plunder they had been forced to bring from the despoiled and destroyed villages. These poor creatures were all that were left out of five or six hundred, the rest having been killed in the villages, or starved in the jungle. All were roped together, some carrying their miserable infants at their backs; while the whip of a slave-driver urged forward those who were nearly exhausted with fatigue. These unhappy women were sent, not to the coast, but to various parts of the interior, where they were exchanged for ivory, black for white. On another occasion, Cameron sketched a dance of warriors, at a place rejoicing in the name of Kiwakasongo: the wild antics of the blacks, incited by the beating of drums, and encouraged by the admiring plaudits of the ladies, were not a little amusing. A clay idol, seen by him at Bwarwé, was a most unlovely monster, shaded under a thatched roof, where the worshippers bent lowly before him. Cameron

came upon a native family changing their abode, or 'fitting;' the men and women bore on their heads bundles of household chattels, and a gourd as a cooking-pot; one of the men carried a child on his head in a flat tray, just as a baker would carry home a hot joint of meat from the bake-house; but for the most part the women carried the bantlings in a peculiar manner at the bottom of the back. One interesting scene that met his view was a lake-dwelling, very similar to those constructed by the natives in Borneo and New Guinea, and now believed to have been well known to ancient nations in an early stage of their civilisation. This dwelling, on Lake Moheya, was elevated on twenty poles, and consisted simply of a living-room covered with a thatched roof; the ascent was made by climbing up a notched pole at one end; a boat, moored beneath, gave the inmates the means of communication with the shore.

Amid such scenes as these, Cameron trudged on. If obstacles barred his direct course, he turned to the right or the left, as the case might be, but still kept his face as nearly as practicable towards the setting sun. His journey was greatly prolonged by these detours. The number of rivers he crossed is almost incredible; he fully ascertained, as our explorers generally have anticipated, that equatorial Africa, instead of being a sterile sandy desert, is one of the best watered regions in the world, possessing immense capabilities for the future. Of course he was robbed, time after time; African travellers mostly are. While going round Lake Tanganyika (after his Livingstone search had merged into an independent series of explorations), he had at first thirty loads of stores, each a burden for one man; but by the time he had circumnavigated the lake, he had only four left, having lost six-and-twenty. Most of his men were by this time unnecessary to him; he would have had to feed them, without needing them as porters. He sent back to Zanzibar all he could dispense with, and started on his great journey westward, relying on the power of purchase to bring him the necessary supplies. Some parts of his trudge were terrible, through long grass twelve feet high, and thicker in stem than a man's finger. He had great difficulty in procuring food. The natives at one spot, who had never before seen a white man, could not conceive of any peaceful object such a traveller could have in view; they suspected him of slave-hunting and village-plundering schemes, and tried to keep him off by violence. Firmness and conciliation worked upon them; they abandoned their apprehensions, and sold him food in exchange for beads, cowries, and such other substitutes for money as he could produce. Looking at the route on Mr Ravenstein's temporary map (prepared under the auspices of the Royal Geographical Society from the traveller's excellent and numerous determinations of latitude and longitude), we see how Cameron was driven by circumstances to change his course repeatedly. First, north-west from Lake Tanganyika to Nyangwé; then (being interrupted by hostile manifestations) nearly due south to Kilemba, and south-west to Kisenga, crossing a multitude of rivers, and passing near lakes known by unpronounceable names. Obstacles too great for him to overcome prevented him, time after time, from reaching the coast at the point where the river Congo enters the Atlantic; then he tried to reach the coast at Loando, in the district of

Angola; again frustrated, he pushed farther south, and at length had the pleasure of seeing the wide-spreading waters of the Atlantic at Benguela—the first white man who, entering Africa from Zanzibar on the east, had traversed the whole breadth of the continent.

One who is well entitled to express an opinion on the matter, Sir Henry Rawlinson, President of the Royal Geographical Society, evidently looks forward to a great future for Central Africa—dependent on the gradual lessening of the atrocious slave-trade. On the evening devoted to the special reception of Lieutenant Cameron, Sir Henry remarked: 'With regard to the political results of his journey, he has discovered a new political distribution of power in the centre of Africa, of which we knew absolutely nothing before. We had not so much as ever heard the name of the great chief Kasonga, who appears to be the most important potentate in equatorial Africa. Ascertaining the power of this chief is a most important element in the future of this part of Africa; for whatever negotiations or measures may be adopted in future with regard to the suppression of the slave-trade, will have to be mainly carried into effect through the operation of this great chief.' So much for political or international relations; nor did the trading aspect of the subject escape Sir Henry Rawlinson's attention. 'I may also remind you that there are commercial results of these discoveries of Lieutenant Cameron. He has for the first time established the fact, that at this great mart Nyangwé, or in the vicinity, the trade-routes from the east and west coasts of Africa unite in a common centre: the Portuguese half-caste traders from the west coast meeting the Arab traders from the east. He has further informed us of the very valuable products which exist in those countries, of which much use may be made in the future. Not only are there cereals of all sorts, but metallic treasures, gums, copal, and other most valuable products. Amongst the results of his work is the information he has brought us with regard to the slave-trade. He has tracked that atrocious traffic to its fountain-head, to those tracts of country and those villages which have been harried and depopulated by the slave-dealer. In furnishing us with this information, and in shewing how legitimate traffic may be introduced and made to supplant the slave-trade, he has done a great service not merely to geography, but to philanthropy and to civilisation.'

Fuller details from the highly successful explorer further illustrate the importance of the newly discovered region in regard to natural wealth and capabilities. Lieutenant Cameron brought home with him a specimen of light bituminous coal; as well as pieces of hematite, specular iron, cinnabar, and malachite. Scraps of information reached him which tend to a belief that gold, copper, and silver exist there in considerable abundance. Besides the copal and other gums above adverted to, he mentions nutmegs, coffee, sesame (the oil-producing sesamum?) ground nuts, oil-palms, mpafu (an oil-producing tree), rice, cotton, india-rubber, sugar-cane, and most of the productions of Southern Europe. What a list of productions from a region the very name of which was not before known to us! A canal thirty miles long, across a flat country, would connect the two great river-systems of the Congo and

the Zambesi, which even now are temporarily connected in the rainy season. Navigation, at any rate for boats, might thus be established right across Central Africa, from the Indian Ocean on the east to the Atlantic Ocean on the west. Lieutenant Cameron throws out a conjecture that a well-managed expenditure of a couple of millions sterling, and two or three years of steady labour, would suffice to establish—at least in its early development—one of the greatest systems of inland navigation in the world. This presupposes all national and political obstacles to be overcome—a difficult proviso, of course.

Ivory, it appears, is so abundant in these parts as to be regarded by the traders with eager interest. We hear of thirty-five pounds of ivory being exchanged for seven or eight pounds of beads, or five or six pounds of cowry-shells. A tusk of magnificent dimensions was on one occasion obtained in barter for an old copper bracelet. Some of the valleys are crowded with oil-palm trees; and Cameron found himself one day under a dense grove of nutmeg-trees, the whole ground being covered with nutmegs. A copper-working company has already, it appears, been established at Lisbon, to smelt down ore obtained through the medium of the Portuguese settlement of Benguela: some of the ore being so rich in silver as to yield a harvest of both metals.

Sir Henry Rawlinson, on the occasion above mentioned, did not confine his remarks to the political and commercial importance of the regions thus newly discovered; he gave a high meed of praise, as was naturally to be expected from him, to the indefatigable explorer who had achieved such grand results. 'This gallant young officer travelled on foot a distance of *three thousand* miles, with very short intervals of rest on the tramp, for two years and eight months, exposed to all the vicissitudes of climate, through forests, marshes, and jungles, enduring hardships of all sorts; and yet his courage never gave way. Lieutenant Cameron kept his eyes well about him; and the observations which he made, both astronomical and in relation to the physical character of the country, are of extraordinary value. The registered observations he has brought home, and which are now being computed at the Greenwich Observatory, promise to be of the most important character. They are astonishingly numerous, elaborate, and accurate; and I have every expectation that the result of their computation will be that we shall find laid down a defined line from one ocean to the other, across twenty degrees of longitude, which will serve as a basis, a fixed mathematical basis, for all future geographical discoveries in equatorial Africa. The observations with which he has furnished us, and which are now being computed—for latitude, longitude, and elevation—number nearly *five thousand*. Naval officers and surveyors will understand the extraordinary minuteness and assiduity with which he did his work, when I state that, in order to determine the longitude of some particular positions, he took as many as a hundred and thirty or a hundred and forty lunar observations in one spot.'

We must, in order to render justice to such scientific achievements, bear in mind that the observations were made under all the trials, peril, and difficulties of African travel, when the

explorer could but little guess on any one day what would befall him in the next. Sir Henry made pleasant allusion to an old chronometer which is likely to have scientific celebrity attached to it. When Cameron met the natives bringing down poor Livingstone's body from Ujiji, he obtained some of the instruments they had brought with them. One of these was a chronometer of which Livingstone often spoke in his narratives with affection, calling it playfully his 'deaf chronometer.' It would only go for three hours and a half; but within that range it was perfectly reliable. This was the instrument which timed the great majority of Cameron's observations.

The world must await the publication of Lieutenant Cameron's own narrative for fuller details; meanwhile our few jottings will shew what sort of man he is. Besides other rewards, he rightly wears the gold medal of the Royal Geographical Society—a much-prized, rarely achieved honour.

ON HELVELLYN.

'A LETTER from Gerald, mamma, with "Immediate" on the envelope. What can be the matter?'

The speaker was a tall graceful girl, with a wealth of light wavy hair falling over her shoulders, and a pair of large blue eyes lighting up a face that was charming alike both in feature and expression. She was leaning over the shoulders of her mother, a stout matronly lady, who was presiding at a well-furnished breakfast-table. Opposite sat this lady's husband, a tall, gray-headed, aristocratic-looking old gentleman. Between them was a dark-haired little maiden, with a rich olive complexion, a pair of witching black eyes, and a half-roguish look lurking at the corners of her mouth.

From the window of the pleasant room in which they were all breakfasting, lay stretched before them one of the fairest prospects the eye could wish to rest upon. In the immediate foreground was a gravelled terrace and a wide sweep of soft green lawn; while all around and sloping downwards ran a plantation of thickly growing trees, rich in the glories of their early summer foliage. Below, stretching far away to the right and left, lay a broad and winding sheet of water, studded with little islets, and ruffled by the morning breeze, looking blue as jasper as it rippled in the sunshine. Beyond, on the other shore, were sloping woods and verdant meadows, with here and there a house peeping up from amid the trees; while still further, making a background to the entire scene, and forming a fitting contrast to the quiet beauty of the mid-landscape, rose a chain of lofty peaks and heather-clad mountains.

The sheet of water was Windermere, the largest, and taking it all in all, the loveliest of the English lakes; and the house to which I first introduced my readers was Raven Castle, the seat of John Vernon, Esq., and one of the most delightful residences in all the country round.

Mrs Vernon perused her son's letter, then read it aloud. It was dated from London, and ran thus:

DEAR MOTHER—Harry Standish is at last able to take a few days' holiday, and is coming down with me to-morrow to pay his long promised

visit to Raven Castle. We shall arrive by the afternoon train, and come up the lake by the steamer. You can send James across with the boat as usual to pick us up at the pier.—Your affectionate son,
GERALD VERNON.

'What a boy he is!' she cried, when she had finished, 'to give me only this short notice. He could not know that Miss Lewis was already staying with us.'

'O dear,' cried the little lady at the table; 'I'm afraid I shall be sadly in the way.'

'Nonsense!' said Mr Vernon, looking over his spectacles; 'the young men, I'm sure, will be only too delighted.'

Dora Vernon had betrayed symptoms of blushing during the reading of the letter, and the quick eyes of her young friend had soon detected her.

'By-the-by, this Mr Standish, is he not the young man whom Gerald introduced us to in London?' asked Mr Vernon of his wife.

'The same. He is so gentlemanly and nice.—I am sure you will like him, Miss Lewis.'

At this stage Dora left the table, and strolled through the open window into the garden. Her friend soon joined her there.

'Oh, you wicked little thing!' she cried, seizing Dora round the waist. 'I verily believe you are in love with this Mr Standish—or whatever his name is—and have never told me a word about it. But I've found you out at last. When did it happen? How old is he? Is he good-looking? Come, tell me everything directly. I insist on knowing.'

'Fanny, how can you be so absurd! I have only seen "this Mr Standish," as you call him, two or three times in my life.'

'And what did he talk about those two or three times?'

'I'm sure I really can't remember. Ordinary topics, I suppose.'

'Nothing else?'

'Nothing else.'

'Well, puss, isn't it jolly of your brother bringing him down just now, while I'm here? Won't we have some fun?'

'Fanny, I'm quite shocked at you.'

'And I at you, for blushing so at breakfast. But never mind; we shall see—what we shall see.'

Here Miss Lewis's bantering was put an end to by Mr Vernon appearing on the scene and asking the young ladies to accompany him for a constitutional.

Punctual to time that afternoon, the two travellers were landed at the little jetty attached to the grounds of Raven Castle. They were both tall, strongly built young men. Gerald Vernon was fair, like his sister; Henry Standish, darker and—though both were good-looking—more finely featured than his friend. They were warmly welcomed by both host and hostess. Fanny Lewis, who had been a school-fellow of Dora's, was a stranger to both; but the glad welcome of the latter, and the tender glances from the soft blue eyes, proved to Henry Standish that he at all events had not been forgotten. He was enraptured with all he saw—the house, the grounds, and all the country round, which he had never visited before.

'Well, Dora,' said her brother that evening, when they were all sitting talking in the drawing-

room, 'have you made out any programme for our week's amusement?'

'O yes,' she answered. 'To-morrow we spend on the lake; Thursday we ascend Helvellyn.'

'Helvellyn!' cried all the others in a breath.

'How delightful!' sighed Fanny.

'Capital!—the best thing we could do,' said Gerald, 'if the weather continues favourable, which I think it will.'

The day following was spent as suggested, rowing about the lake and picnicking on one of the little islands.

And then came Thursday, bright and cloudless, and giving every prospect of a fine and charming day. The four young people were driven over in Mr Vernon's wagonette to the little inn at Wythburn, from which the ascent was to commence. On the way they passed through Ambleside, then at the height of its busy season and full of summer tourists; Rydal and Grasmere, with the little white church and silent graveyard, where the poet Wordsworth lies buried; and then up the long steep of Dunmail Raise, till they reached the Nag's Head at Wythburn, their destination. Gerald and Dora had climbed the mountain so often that a guide was unnecessary, and the two ladies would not hear of ponies. So they started off in gay spirits, fully equipped with stout shoes, baskets for botanical specimens, and strong Alpine-stocks. The ascent began almost at the inn-door, and continued upwards by the side of a little stream that came dancing down the mountain-side.

Laughing and talking, slipping and stumbling, they were soon half-way up the frowning mass, and a map-like view of lakes and valleys, hills and bounding streams, was beginning to unfold itself at their feet. At length a point was reached where a faint sheep-track suddenly left the path-way they were pursuing, and wound up the mountain in a contrary direction.

'Now!' cried Dora, stopping; 'which road shall we take? Gerald and I explored this track years ago, and found it an agreeable change from the regular path, though rather longer.'

'But,' said Gerald, 'we are not far now from Brownrigg's Well; and if we do not keep to the main path, we shall miss it; and that would be a dreadful disappointment, for Miss Lewis and I are almost dying of thirst.'

'Suppose,' suggested Harry, 'that we divide into two parties, and meet on the summit?'

'Yes,' cried Miss Lewis; 'and have a race who gets there first, of course giving those who take the longer road a fair start.'

'What do you say, Miss Vernon? Shall we separate?'

'Yes, certainly, if you all agree to it. You and I can take the sheep-track; and Gerald and Miss Lewis the path past the well, as they are so thirsty.'

'Very well; it is settled, then,' said Gerald. 'Good-bye.'

'Until we meet,' added Fanny, pointing upwards with a little tragic gesture, 'on the mountain's brow.'

They then separated, and soon each couple was hidden from view.

Of the whole four, perhaps Mr Standish was the most pleased at this arrangement; for truth to say, he was enamoured of the fair-haired damsel by his side, and this was the first opportunity he had

had since his arrival of being left with her alone. A short year before, when the Vernons were staying in London, Gerald—who was then reading for the Bar—had introduced him into their little circle; and each time that he had visited them, he had become more and more filled with admiration of Dora. He knew that it was wrong and foolish in him—a comparatively poor man, with his own way to make in the world—to fall in love with a rich man's daughter; but he could not resist the fascination of her sweet society, and at last had parted from her with the avowal of his love hanging mute upon his lips, though not daring to give it utterance.

And Dora—what had been her feelings all this time! Ah! had she not betrayed them all too plainly that happy morning two days before, when she had first heard that he was coming?

They continued their rugged journey up the bleak mountain side, Dora leading the way, and Harry stopping every now and then to secure some rare little fern that lay concealed among the crevices of the rock, or to glance below on the glorious prospect that now lay stretched beneath them. At length the path they had been pursuing brought them gradually round to the other side of the mountain, and there joined one of the main tracks to the summit—the one leading from Legberthwaite and Thirlmere, past the Glen-ridding lead mines. Having reached a charming nook under an overhanging rock, which commanded a new and magnificent view, they agreed to rest for a few minutes, and then mount upwards as quickly as possible.

To their right, lay Red Tarn, six hundred feet immediately beneath the summit of Helvellyn, fenced in on the one side by the rocky ridge of Striding Edge, and on the other close to where Dora and her companion were resting—by a similar barrier, called Swirrel Edge, having for its eastern termination the conical-shaped peak of Catbedeckan. Beyond lay the lovely lake of Ullswater, with Stybarrow Crag and Gowbarrow Park fringing its western shores; while the lofty mountain of Cross Fell in the extreme distance closed in the horizon, and stood out boldly against the sky. It was a kind of rocky terrace they were on, overhanging a precipice that ran sheer down for about thirty feet, till it abruptly terminated in a small mossy bank. This also, in its turn overhung another precipice of considerable depth, making one faint and dizzy even to look down.

The young man had all through their walk been striving manfully to keep himself from making the long unspoken avowal of his love; but now that they were alone—here in the cool shade, with such a panorama before them and the knowledge of their utter seclusion from the outer world—he could no longer remain silent.

'Miss Vernon,' he said, after a pause, during which Dora had been occupied in sorting her ferns and flowers; 'do you remember that night in London when I said good-bye to you for the last time?'

'O yes,' she answered quickly.

'Well, I little thought then that I should ever see you again. I felt assured then that my secret was safe—that I should never be compelled to divulge it—that I should never suffer the humiliation which I knew could but follow its revelation.'

'A secret!' she reiterated, looking at him wonderingly. 'I do not understand. What secret?'

'Can you ask it?' he answered, taking her hand. 'In one short week, Dora—may I call you Dora?—I had learned to love you more than my own life; but I dared not tell my love—I dared not think of it. For I was a poor man then, as I am now, and you—you were the daughter of a rich man.'

She was trembling violently, and her eyes were moistening.

'O Dora!' he cried passionately, 'those tears give me new hope—new life. You do not scorn me then for my presumption—you do not cast me from you! Tell me, dear one, tell me—can it be possible that you love me?'

She did not speak, she did not utter a word, but allowed herself to be drawn by his strong manly arm in a fond lingering embrace—listening to the loving words that fell from his lips—with looks that told him all he wished to know.

How long they remained upon that little terrace can never be told; but Harry Standish at last looked at his watch with a cry of amazement.

'Why,' he cried, 'Gerald and Miss Lewis will think us lost! They must have reached the summit long before this; and we have evidently come considerably out of our way. Had we not better ascend at once?'

'O yes,' said Dora. 'It will indeed take us all our time to reach them, and then be back at the inn before dusk. Let us go at once.'

They made ready for an immediate scramble up the steep hill-side; but before going, Harry eyed a small plant growing at the edge of the path, and was on his knees in a moment, busily uprooting it.

'The *Cerastium Alpinum*!' he cried delightedly, 'and the first I have seen.'

'Yes,' Dora answered; 'it grows, I believe, only on Helvellyn. But do, do be careful; you are dreadfully near the edge of the precipice. Do not lean over; you will— Ah!'

With a wild cry she rushed forward. Her companion, too eager to secure the plant, had overbalanced himself, and with a cry of terror, had fallen down the abyss. Dora stood on the brink, gazing downwards, her eyes dilated with horror, unable to move, to speak, to help!

But his fall was suddenly checked by the shelving rock, covered with moss, which alone broke the precipitous descent; and Dora saw him lying there, with his arm twisted beneath his back, and a wound on the forehead, caused by a sharp-pointed piece of rock he had struck against as he fell. She called out to him in her agony and grief, but there was no response. She then cried aloud for help, with all the strength she could summon to her aid; but the only answer that greeted her was a dull faint echo from the distant peak of Catchedern. What could she do to save him? She knew that if left alone there for long without help, he must perish; and rushing frantically from one end of the little terrace to the other, she strove vainly for a means of reaching him. Her nerves were strung, however, to the highest pitch. She seemed possessed of a strength she had never felt before. She would reach and save him, or die herself in the attempt! With her Alpine-stock for a support, she half-

scrambled, half-slid down the rocks, some little distance from where her lover had fallen, and where the descent was not quite so precipitous; tearing her dress and bruising her face and limbs, but with the strength, energy, and courage that her desperation had endowed her with, she reached the mossy bank in safety, and rushed panting to the wounded man.

'My darling—my darling!' she wailed, as tearing her kerchief into strips, she quickly bandaged the poor wounded head and stopped the flow of blood. Then, while he was still unconscious, she gently raised him, and moved the arm from its painful position, to his side. She then knew that it was broken, and moaned aloud in her agony and despair; for how was he to be got away—away from this horrible mountain, to the civilised world below, where he might have help and succour? A dreadful thought, which she could not suppress, suddenly flashed through her brain: Suppose they could not get away at all—suppose help should *never* come! She leaped from her kneeling posture by the wounded man, and hastily traversed the little bank on which they were stationed. It was but a few yards long and a few feet in width. It would be next to impossible to get back again by the way she had come, or by any means above; while below, all around them frowned the deep precipice, with the Red Tarn at the bottom, and the mass of broken rocks that formed the base of Swirrel Edge. Even if she could have regained the pathway to go for help, could she leave him while he remained in his then unconscious state? But she would not despair; she would not give way to useless grief and idle tears. She believed that God would help her in this her sore distress, and kneeling down at the foot of a rock, she poured forth a prayer full of earnestness and yearning faith.

If she had had but a little brandy, or even a draught of cold water to wet those poor parched lips with, and to bring him back to consciousness; but she had nothing, nothing! Suddenly a thought seemed to strike her, and bending quickly over her lover's outstretched body, she gently loosened his coat and felt in his breast-pocket. A memorandum-book, and—what was this her fingers seized so eagerly, while a cry of joy burst from her lips? It was a small flask fashioned so as to fit comfortably in the pocket without fear of breakage. Unscrewing the lid, she tested the contents. It was full of brandy; and hastily emptying some into the cup that was attached, she held it to his lips, and poured the reviving fluid down his dry parched throat. Long and patiently did she await the result.

At last he moved slightly, while a faint moan escaped his lips; then opening his eyes, he looked steadfastly up at Dora's pale wan face.

'Where am I?—what is the matter?' at length he moaned feebly, looking wildly round.

With a great sigh of relief and thankfulness, Dora tenderly held him to her breast, and told him all.

The sun was already sinking over the western hills, and the strange silence all around oppressed, but did not frighten her. She had nerved herself to endure the worst that might befall her, and was now prepared for anything—even death itself. At length the crescent moon rose behind a distant

ridge, and the stars one by one lit up the dark blue canopy above.

'On Helvellyn!' he repeated, hardly crediting his senses. Then, with a sharp cry of grief: 'And it is my fault—all my fault. You, my poor Dora, here, at night, on this cold, damp mountain. Oh, I can never forgive myself; it is horrible, horrible!'

'O Harry, do not think of me. Think only what would have happened if I could not have reached you. Let us rather thank God that I came in time.'

'My preserver!' he cried fondly; 'my truest, dearest love!'

He was very weak, and his arm pained him considerably; but he bore it very patiently, and sublimed with a grateful heart while the girl improvised a splint made from a portion of her Alpine-stock, hastily broken off for the occasion. Exhausted with speaking, he fell into a quiet sleep, with Dora's hand clasped lovingly in his, and her face watching tenderly beside him. She had known neither hunger nor fatigue, though she had tasted barely anything since morning.

Through the tedious hours of the night she kept her sacred vigil, until at length morning dawned upon the great world below, and the sun rose magnificently over the mountains. Dora was on the alert. She knew that her father and brother would not leave a stone unturned to discover what had befallen them, and she felt sure that they would first thoroughly explore the path they had taken the day before. She resolved, therefore, to be constantly on the watch, for she could see easily, from the edge of the bank, any one who happened to be crossing the terrace above. Harry was still lying weak and stiff. But assistance was happily at hand, and voices could be distinctly heard, proceeding from overhead; and suddenly figures were descried moving on towards the edge of the precipice. Yes!—Dora could now distinguish them. Gerald, her father, and some men carrying tools and ropes.

'Gerald! father!—help! We are here!' she cried with all her strength, dreading lest they should neither see nor hear her.

'Mr Standish is here, dreadfully hurt. He cannot move.'

Adjuring her to take courage, they immediately proceeded to devise plans for relief. A rude car was fashioned by the men out of some boards, and let down the side of the rock by means of ropes.

Dora did not need to be instructed what she had to do; but with the bravery and strength that had sustained her throughout the whole of that dreadful ordeal, assisted Harry on to the rude craft—where he could lie at length—and bound him safely to it with pieces of strong cord that were thrown down to her.

Up, up it went. How anxiously she watched the ascent. It was lowered again, empty. She gave a sigh of relief; and hastily binding herself to the car, was soon hoisted into mid-air, and a loud and prolonged shout of joy burst from every lip as she safely reached the top of the precipice.

'Saved—saved!' she cried, rushing into her father's outstretched arms, and weeping glad tears of joy and thankfulness upon his breast.

She then quickly told him all that had occurred, for it was necessary that the wounded man should be got away as soon as possible. Indeed, this was a difficult task, for he was too weak to walk; but

the rescuers were brave and resolute, and converting the car into a species of stretcher, they carried him as carefully as possible down the steep and rugged descent.

'We have passed a dreadful night,' said Gerald to his sister, as they descended; 'almost as bad as yours. Yesterday, after leaving you, Miss Lewis and I made our way steadily to the summit, and reached it early in the afternoon. We must have waited there two or three hours, but you never came; and at last we concluded you had tired yourselves, and had gone back to the inn. We went down again by the way we had come, only to find, on reaching Wylthburn, that you had not been seen or heard of. It was then nearly dusk; and when it became quite dark, we were obliged to return alone, for it was impossible at that time to seek you on the mountain. This morning my father and I started with a gang of helpers before daybreak, and commenced our search in the early dawn.'

Gerald having then to go forward to help the men with the stretcher, Dora was alone with her father; and in a few short minutes had told him all that had passed on the little terrace, before the accident; of the young man's true and sincere affection, and of her own new-born love.

Weeks afterwards, a young man, with his arm in a sling, was lying on a sofa that had been brought out for him into a warm sunlit garden, filled with the perfume of sweet-smelling flowers and the gentle air that came up from the lake below. A fair-haired girl was seated near him, holding in hers his outstretched hand.

'Dora,' he was saying tenderly, as he looked up into her sweet young face; 'I often think that, were it not for the pain and misery you had then to suffer, I ought to look back upon my accident as the brightest event of my existence. For did you not save my life, darling, at the fearful peril of your own; did you not seal our betrothal with a noble self-sacrifice; did you not prove more than aught else could have done—that your love, like mine, was dearer than life itself!'

AN INTELLIGIBLE ART-WRITER.

SENSIBLE folks open any book professedly written upon Art with much misgiving, and the more so the more they are accustomed to books on this alarming subject. There is something in it that seems to have a scattering effect upon the wits of even intelligent writers. A welcome, therefore, should be given to any work on art which is reasonable, without pretence; and such a book now lies before us in *The Fine Arts and their Uses*, by Mr Bellars (Smith, Elder, & Co.). He addresses himself, not to artists, but to the general public, whom he warns off the rocks and shoals on which their taste is apt to be shipwrecked. He speaks of the thousands of people who go into raptures over Verrio's painted fiddle at Chatsworth, 'who would be in no way affected by the sight of a real fiddle.' The admiration they feel is the same as that extorted by any ingenious toy, and Fine Art, he wishes them to understand, is not a toy. The artist also who wishes to be admired merely for his skill and

patience, is not an artist in any high sense. Mr Bellars is honest—and very unexceptionally honest—in at once confessing that in passing from verbal poetry to painting we necessarily lose a great deal. Painting is after all inarticulate; it may make itself understood indeed to some, but not to others; and its sphere is much more limited than art-worshippers would have us believe. 'It is certain that of the people who visit our picture-galleries, nine-tenths see nothing more in Turner or Francia than a more or less successful attempt to reproduce some external fact of nature or history.' And it might even be added, that some people see more where there is really no more to see; just as the commentators will sometimes root out a meaning in their author which would astonish nobody so much as himself.

Mr Bellars does not go to this extreme of frankness; but he is more than 'tolerably honest' for a gentleman whose vocation is to write of Art. He acknowledges, for example, that music, though it exercises so widespread an influence, has 'the power of awakening but two principal phases of emotion: that is to say, elation and depression in all their various forms.' He is careful to point out, indeed, that when 'wedded to immortal verse,' its power is of much wider range; but then the sentiment of the words is often taken for that of the music itself. He adds, rather naively, that 'it will be found that the allusions in Beethoven's Pastoral Symphony are much more fully understood when there is some sort of syllabus in the programme for easy reference. Even these are not fair examples, for as they contain direct imitations of natural sounds, it would not be surprising if their motives were readily recognised.'

As for Dancing, we do not dance now; that is, there is no such thing in fashionable society, while the dancing on our stage is simply meretricious. But if you want to see what dancing, were natural grace of action, can effect, look at Mr Bellars' pretty picture of it: 'One of our old friends the organ-grinders—such a source of pleasure to the lower, and so much abused by the upper classes—has wearily dragged his organ into a quiet street on a bright summer evening. He is heavy-hearted, for he has received but few halfpence; the sun has been intensely hot, and he has been "moved on" all day, having been unfortunate enough to disturb three sick persons and a mathematician. But he must try and earn another penny or two, and he begins once more to grind out the old tunes, now so familiar that he scarcely hears them. A group of little children from a neighbouring alley gather round him, and gaze with wondering eyes upon his instrument and on himself. He smiles upon them sadly enough, for in his simple heart he loves young children dearly; and once in the old Italian days days now so infinitely far removed—had some of his own. But soon the tune is done, the barrel is shifted, and he begins another. It is an old Scotch reel, with a lilt and a quaint chime about it that would

make the very gas-lamps caper in their sockets if they knew how. And soon the children's eyes begin to sparkle, the dimples deepen in their dusky cheeks, and with one merry glance at their entertainer, they are dancing as only children can. Their round arms escaping from their dingy sleeves; their rich tangled hair falling over their shoulders, and their little lithe forms swaying with an infinite grace; their innocence, for they are innocent as yet even in a London alley, their health, and all the exquisite joy of young emotions, find their best expression so.' Mr Ruskin himself need scarcely be ashamed of the above description, which gives us art at its best, because derived direct from nature. At the same time, it is undeniable that dancing may be brought to a very high pitch of perfection by art. 'Jeremy Taylor,' says an old critic quoted by our author, 'pronounced an anathema against dancing, but had he ever seen Taglioni, he would have rented a stall.' Dancing without music, however, it must be confessed, is like veal without bacon, rather insipid.

Mr Bellars gives what seems to us a rather singular reason for why so much of the best music is sad. It is for the same reason, he says, that the best poetry is sad; though he should surely rather say the sweetest poetry. 'Our sweetest songs are those,' sings Shelley, in his ode to the Skylark, 'which tell of saddest thought;' whereas the epic is not sad, but only sublime. 'Nearly all men who think or feel deeply,' says our author, 'are so oppressed by the miseries and mysteries around them, that Joy comes to them but seldom, and before they can embrace her, she has fled. Probably bright and happy men would always write bright and happy music—but such men are hard to find.'

This may be in part correct, but we believe that it is the memory of the Past, and especially of the happiness of the Past, that makes the poet and the composer both so sad. 'The sorrow's crown of sorrow is remembering happier things;' and it is not because the world is so black with them, but because it has once been so bright, that men sing and play so sadly. They are sighing for the 'happy days' of auld lang syne. Of the absence of imagination among the old masters, our author speaks boldly, though he seems to admire what common-sense tells us is a defect. The early Pre-Raphaelite painters 'knew of course perfectly well that St Peter never wore a triple crown, and that St Stephen did not go about balancing stones on his head,' yet they chose so to paint them: 'out of earnest faith and feeling,' and all the rest of it, says Mr Bellars; but why not from sheer want of imagination? From what one knows of modern painters and their 'faith and feeling,' we confess this seems much more likely. Painters took up with religious subjects in those times, not because they themselves were religious, but because those subjects were the only popular ones.

Mr Bellars of course denies that art is a matter of taste. But after all, that is what it comes to. It is certainly not a matter of fact. Nothing can be more absurd, for example, than to admire the old masters because they are old masters; a stupidity which led some painters of late years even to

imitate their acknowledged shortcomings, such as stiffness, angularity, and want of perspective. Nor is it true that even the most accomplished connoisseur can always distinguish between an old master and an imitation. We have seen some notable mistakes of this sort made within the last few years by the highest authorities; where stolen pictures of the utmost value have been hawked about, and pool-pooled as palpable forgeries by those to whom they were offered for sale—because they were offered at a cheap price.

Though the pretence of picture-impostors has been exposed a hundred times, imposture still goes on. Every one knows the story of Michael Angelo's 'Sleeping' (upil, which he buried, that the art-critics of his day might find it, and recognise it for a priceless bequest of antiquity! Mignard painted a Magdalen so much after Guido's manner that it deceived that prince of art-critics, Le Brun, who not only paid two thousand crowns for it, but wanted to bet three hundred louis that it was Guido's. 'Well, the picture I painted,' said Mignard, 'was done over the portrait of a cardinal; and with a pencil dipped in oil he removed a lock of the Magdalen, and shewed a cardinal's hat. The famous 'Innocent Impostors' of Bernard Picart, a set of prints professedly from the designs of the old masters, deceived the whole art-world of his time, as a similar work would doubtless deceive them now, though without abating their arrogance. The unhappy fact being, that the intrinsic merit of a work is nothing in their opinion compared with an established name.

Mr Bellars, to do him justice, is above this weakness. He has given, for the thousandth time, a definition of Beauty, which is at least original: he says it is *the intrinsic perception of goodness*. 'If we have to think and argue with ourselves about it, it is not beautiful to us.' According to this theory, Le Brun was right enough in his judgment of Mignard's picture, and ought to have stuck to it, which we may be sure he didn't. Though not quite coinciding with some of our author's ideas, he is generally quite plain and straightforward, even upon such a subject as *chiaroscuro*,* about which perhaps more rubbish has been spoken and written than on any other. He points out that the effects of nature in this line can only be represented on canvas by elaborate artifice. 'No lamp-black—even apart from its surface reflection—is so dark as a cleft in a rock; no whiteness which the painter can produce, when seen in the ordinary suffused light of a room, equals the effect of a white object under the direct rays of the sun. Yet Claude and Turner have painted the sun, and the glow of nature under its influence, and the deficiency in force does not strike us.' This is effected by the ingenious use of contrast. The sea-bird which seems white against the cliff will seem dark against the bright sky. On the other hand, it is true that some great masters have scorned these devices, though they seem reasonable enough. Michael Angelo, for example, worked in fresco, 'exhibiting therein a breadth and generalised treatment, both of form and colour, such as to raise the mind at once above the idea of deceptive representation.' He even ventured upon an observation, not often quoted by artists, that 'oil-paint-

ing was an occupation fit only for women and children.' He would probably have entertained the same opinion as Mr Bellars does of Gustave Doré's 'Christ Leaving the Pretorium,' wherein the prominence and dignity of the central figure, obtained by making every leading line of the picture converge upon the same point, is here likened to the conjurer's trick of 'forcing a card.' Our author does not certainly hesitate to attack great public favourites. He accuses Landseer, for example, of passing the boundary-line which divides legitimate exaggeration from caricature. 'No dog *smiles* like the glossy-coated spaniel in the "Alexander and Diogenes";' and the supercilious *hauteur* of the hound-footman is still less doggish.

Much of Mr Bellars' book is, as we have shewn, both intelligent and entertaining; but perhaps the best part of it is his examples of *colour* from the poets, drawn from the works of Shelley, Coleridge, and Wordsworth. He shews us how superior are the lines of these genuine poets to those of mere 'word-painters,' and how not only the scene is expressed by them, but the sentiment. Thus, in Tennyson's *In Memoriam*—and in the same poem, by-the-bye, in which occurs perhaps the finest description of the dawn of day in our language—he points out an admirable representation of twilight:

The doubtful dusk revealed
The knolls once more, where, couched at ease,
The white kine glimmered, and the trees
Laid their dark arms about the field;

the last line of which 'exactly conveys the weird effect of spreading trees in an imperfect light.'

Again, in the same chapter (upon 'Verbal Poetry'), he calls some very interesting specimens of what he calls 'thought-rhymes' from the Bible, and arranges them in their rhythmical form. In the 135th Psalm, verses from 15 to 18 are thus presented to us:

'The idols of the heathen are silver and gold,
The work of men's hands.
They have mouths, but they speak not;
Eyes have they, but they see not;
They have ears, but they hear not;
Neither is there any breath in their mouths.
They that make them are like unto them:
So is every one that trusteth in them.'

The whole book, indeed, is evidently the product of a sincere and earnest mind, well stored, and capable of unusual appreciation. He has a rare reverence for what is sublime, and we may add divine; and yet does not scorn mere niceties. His account of the 'Asonante' verses—used by the Spaniards, and copied from them by Mrs Browning—is, for instance, well worth reading. In these verses 'the *same* sound does not necessarily recur, but one comes in its place sufficiently like it to suggest a correspondence between the two; thus, in the *Dead Pan* of our great poetess,

Neptune lies beside the *trident*,
Dull and senseless as a *stone*,
And old Pluto, dead and *silent*,
Is cast out into the sun;
Ceres smileth stern *thereat*,
"We all now are *desolate*—
Now Pan is dead!"*

* This alarming word might be simply translated, 'the absence of light and shade,' but that would make it too commonplace.

* We have italicised all the terminating words, as our author has done so, but as a matter of fact, only *trident* and *silent* are 'Asonante' rhymes; all the rest are what is termed 'allowable.'

A much more remarkable instance of this kind of rhyme is to be found in Shelley (where, however, it was probably not designed), in the lines :

I can give not what men call love ;
But wilt thou *accept not*
The homage the Heart lifts above,
And the Heavens *reject not* ?

For which contempt of poetic rules and regulations, as Macaulay would have said, 'any school-boy' would have been whipped.

Of the use (and abuse) of stained glass, Mr Bellars has some excellent advice to offer. Any effort at landscape in this art, he shews to be out of place, the colour not being painted on the glass (as some suppose), but given to it in the course of manufacture. 'There is no merit whatever,' he says, 'in the attempt to do anything which is out of harmony with the materials and methods at the disposal of the artist. . . . The Munich stained glass, for example, is admired by most people for the very quality which it ought not to possess, that, namely, of attempted realism.'

On the other hand, our author combats Mr Ruskin's views on the absurdity of form and elegance in a railway-station, and justly asks why that description of building need be ugly, in which people pass on the whole more spare time, in which they have nothing else to do than to admire, than in any other.

On the whole, we can cordially recommend this volume ; for, while true to his colours, and magnifying his office—or rather his subject—Mr Bellars does not, as some art-writers do, overwhelm us with big words and high-sounding eulogy. Art has very elevating effects, and much more distinct uses than is generally understood ; but it is also the very stronghold of affectation : chiefly for this reason, that patrons—flattered by their parasites—imagine that they are shewing good taste, and even considerable intelligence, when, in fact, their admiration of art is upon no higher intellectual level than their pretended craze for old china.

OCCASIONAL NOTES.

A FEW weeks ago, in the article, 'What to do with Money,' we offered a word of warning against making investments in fraudulently got-up concerns, and in particular advised every one to 'shun railways, mines, and other undertakings in the United States.' Since then, some remarkable statistics regarding defaulting railways in the States have been given in a New York newspaper. From these we learn, that from 1873 to the 1st January 1876, the bonds of defaulting railway companies amounted to seven hundred and eighty-three million, nine hundred and sixty-seven thousand, six hundred and sixty-five dollars ; or about a hundred and fifty-six millions sterling. Altogether, there seem to be seventy-four defaulting companies—that is to say, companies which cannot pay their borrowed money, independently of their embarrassments otherwise. Nearly a third of the money was borrowed from English investors. In the face of this fact, it seems little short of madness for people in this country to invest a shilling in American railway undertakings. All

American railways are, of course, not financially deceptive ; but who at the distance of three thousand miles, and without any power of discrimination amidst no end of lying reports, can get at the truth on the subject !

The constant occurrence of deaths from the foolish practice of pointing guns at persons, under the impression that the weapons are unloaded, calls for some severe punishment. A correspondent of *The Times* makes a sensible suggestion on the subject. 'It is, of course,' he says, 'an assault merely to point a gun or pistol at any one, but whenever it happens to result fatally, the accused person usually gets off scot-free ; he is usually very sorry, and every one feels that he is really a sufferer by the transaction. So he may be, and I would suggest that he be made really a sufferer. I would suggest that it should be made an offence punishable by imprisonment for three or six months with hard labour to point a gun or pistol at any one. It should be no excuse that the gun was not loaded or was thought to be unloaded. I think this would stop the abominable practice.'

A certain sea-side town has been considerably pulled into notoriety as a suitable resort for persons seeking health, on account of the quantity of ozone in the atmosphere. We will not dispute the fact, but it may be doubted whether one sea-side town more than another naturally possesses any specially large amount of ozone. What, however, is ozone ? That is a question more easily asked than answered. It appears to be a highly concentrated condition of the oxygen which forms the peculiarly vital part of the atmosphere, and is produced through electrical agency. The mechanical action of pure air over vegetation is productive of ozone, but still more manifestly is this subtle quality produced by the dashing of waves and spray against the air. These lashings of air and sea mixed are, electrically speaking, in the nature of one substance rubbing on another. They evoke ozone, which being inhaled in breathing, gives a stimulus to the constitution. Hence, the benefit to health from a sea-voyage, or a residence at a pleasant sea-side resort. We learn from a paper read by Mr Binney at a recent meeting of the Manchester Literary and Philosophical Society, that the atmosphere of towns may be sensibly ozonised, and of course improved in quality by the action of public fountains. He says : 'A water fountain may be regarded as a hydro-electric machine, the friction of the water issuing through the jets developing electric action, materially assisted by the conversion of the spray into aqueous vapour. I would suggest that this fact should be prominently brought before municipal bodies, to induce them to erect fountains in all available places in large cities, as sanitary agents. They might prove highly beneficial in crowded localities.' It need only be added, that the delicate and wholesome freshness of the air after a rattling thunder-shower in summer is very much due to the development of ozone. The subject of ozone, in its various phases, is at present engaging the attention of scientific inquirers, and we may soon hear more about it.

An attempt to explain the cause of the extraordinary corruptions prevailing among public

administrators in the United States, and now attracting public attention in Europe, is made by two of the leading London journals. The *Pall Mall* imputes much of the evil to 'the smallness of official salaries,' along with the vulgar taste for living extravagantly. Not being paid properly for his public services, and having no hereditary wealth to fall back upon, the official makes up for deficiencies by peculation or taking bribes to promote jobs and monopolies. We do not doubt that there is much truth in this conjecture; but it is not the whole truth. Official life in the States has become a trade in the hands of the least respectable of the population. Men of any mark shun it with disgust, not only, perhaps, from a matter of sentiment, but from the superior attractions of ordinary enterprise. The *Saturday Review* presents an analysis of the origin and education of the seventy-four senators and two hundred and seventy-two representatives in Congress; from which it is seen that a large proportion began life humbly, and enjoyed only the elements of school education. A number of them, for example, began life as farm-labourers, and worked their way on by skill and perseverance. While the facts disclosed make it obvious that, in the United States, the humblest citizens may aspire to the highest offices, it is not less certain that this facility for advancement acts detrimentally in deterring the well educated and the affluent from entering on public life. The acute observer from whom we quote, says very plainly: 'Political life has become so degraded that men of culture will have nothing to do with it. The way is thus left open for needy and half-educated adventurers who have fluency enough to repeat with effect upon the stump the commonplaces of popular oratory. They engage in log-rolling and wire-pulling and all the other practices by which Transatlantic politicians promote their own interests. Step by step they rise, and at last reach Congress. They have got on by courting the mob, by making themselves useful to men of influence, and availing themselves in turn of the services of aspiring followers. They have no knowledge or culture to grasp the principles of a broad national policy, or to perceive the defects of institutions worn-eaten by corruption. Naturally, therefore, they turn from this strange and uncongenial task of considering laws the merits and defects of which they are alike incapable of appreciating, to the practice of the arts on which they have prospered. Under their influence rings are formed and lobbying flourishes. They sell their support to the executive government for a share of its patronage. And they sell their votes to Credit Mobiliers and Railway Companies for hard cash. Their influence reacts upon the constituencies, and deepens their corruption. It extends to the Administration, lowers its moral tone, compels it to bargain for support, and surrounds it with tools fit for its purposes. And thus is brought about the state of things in which Cabinet Ministers barter away the offices in their gift, and the members of the President's family trade in government posts.' In these remarks generally there is uttered something of a note of warning. Alas! in this country, many men of upright character and of sensitive minds decline to take part in public affairs, from an unwillingness to propitiate mobs of illiterate voters by pandering to their

prejudices. In short, they prefer private life with its agreeable solacements to a public career secured by a dishonest avowal of principles. Where this is to end, we know not, but the subject is worthy of consideration before it is too late. W. C.

THE HERMIT.

The following verses were written in the last century by James Beattie, son of a small farmer at Laurencekirk, in Kincardineshire. Being appointed schoolmaster of the picturesquely situated parish of Fordoun, Beattie, who had shewn poetical talent while a boy, had now ample opportunity for developing it, the result of which was that he composed many pieces—such as the *Minstrel*—of very high merit.

At the close of the day, when the hamlet is still,
And mortals the sweets of forgetfulness prove,
When nought but the torrent is heard on the hill,
And nought but the nightingale's song in the grove:
'Twas thus, by the cave of the mountain afar,
While his harp rung symphonious, a hermit began:
No more with himself or with Nature at war,
He thought as a sage, though he felt as a man.

'Ah! why, all abandoned to darkness and woe,
Why, lone Philomela, that languishing fall?
For spring shall return, and a lover bestow,
And sorrow no longer thy bosom intrude:
But if pity inspire thee, renew the sad lay;
Mourn, sweetest complainer, man calls thee to mourn;
O soothe him, whose pleasures like thine pass away:
Full quickly they pass—but they never return.

'Now gliding remote on the verge of the sky,
The moon half extinguished her crescent displays:
But lately I marked, when majestic on high
She shone, and the planets were lost in her blaze,
Roll on, thou fair orb, and with gladness pursue
The path that conducts thee to splendour again;
But man's faded glory what change shall renew?
Ah, fool! to exult in a glory so vain!

'Tis night, and the landscape is lovely no more;
I mourn, but, ye woodlands, I mourn not for you;
For morn is approaching, your charms to restore,
Perfumed with fresh fragrance, and glittering with dew.
Nor yet for the ravage of winter I mourn;
Kind Nature the embryo blossom will save.
But when shall spring visit the mouldering urn?
O when shall it dawn on the night of the grave!

'Twas thus, by the glare of false science betrayed,
That leads, to bewilder; and dazzles, to blind;
My thoughts went to roam, from shade onward to shade,
Destruction before me, and sorrow behind.
"O pity, great Father of Light," then I cried,
"Thy creature, who fain would not wander from thee;
Lo, humbled in dust, I relinquish my pride:
From doubt and from darkness thou only canst free!"

'And darkness and doubt are now flying away;
No longer I roam in conjecture forlorn.
So breaks on the traveller, faint, and astray,
The bright and the balmy effulgence of morn.
See Truth, Love, and Mercy, in triumph descending,
And Nature all glowing in Eden's first bloom!
On the cold cheek of death smiles and roses are blending,
And beauty immortal awakes from the tomb.'

A MERCHANT PRINCE.

WHEN visiting New York in 1853, we were shewn an enormously large and splendid store of haberdashery in Broadway, known as Stewart's dry-goods store, and said to be the largest establishment of the kind in America, if not in the whole world. Stewart, we were told, was by birth an Irishman, but of Scotch extraction, and had risen to eminence in his profession, and attained enormous wealth by skill, perseverance, assiduous industry, and tact, along with his unswerving integrity. The career of this remarkable man was a study, and it has become more so since his recent decease. Rich as he was twenty-three years ago, he was far richer at his death, while his business establishments had spread and successfully taken root in all directions. Merely as a money-maker on a large scale, he would merit notice only as a kind of curiosity. His life, however, as has been pointed out by the press, was something more than that of a person eager in the accumulation of dollars. In short, Stewart's career bears a moral; and on this ground, after everybody else has had his say, we bring it under the special attention of the young.

Alexander Turney Stewart was born in the neighbourhood of Belfast, in 1803. His parents were in pretty good circumstances, but they died while he was still young, and as an orphan he fell to the charge of his paternal grandfather, who gave him a good education. He sent him to Trinity College, Dublin, with a view to being trained for the Established Church; but this plan of becoming a clergyman was deranged by the death of the grandfather. Stewart now fell under the guardianship of a respectable Quaker, by whose hints and good advices he was grounded in principles of honesty and truthfulness. Animated by an adventurous spirit, he at eighteen years of age went off to push his fortune in the United States. Scholarly in his tastes, and with no knowledge of business, he obtained a situation 'as teacher in a school, and in this capacity spent two or three years. He had private pupils, some of whom

are now living, to whom he taught writing and arithmetic, and he helped the present Secretary of State at Washington to acquire the rudiments of Latin and Greek. To advice that he should go into trade, young Stewart for some time turned a deaf ear; but being called back to Ireland to receive a legacy of a thousand pounds, he yielded to the suggestion of a friend, and invested a large part of the money in laces and "insertions," which he bought in Belfast, putting the remainder into a small miscellaneous stock of dry goods. He brought the stock to New York, and in a tiny shop—some twelve feet frontage and twenty-five feet in depth—he made his start as a business man. He was his own salesman, book-keeper, and porter. He was so little acquainted with his trade that when asked for hose he did not know that stockings were meant, and from more stylish customers he gathered the names of articles which he saw upon them and desired to add to his stock. He prospered, however, and moved into a larger shop in the same vicinity, near the City Hall Park. He bought job-lots at auction; married, and lived in a single room over his shop; and when the day's business was over, he and his wife worked through half the night, sorting the stock and presenting it to the best advantage. Again he prospered and again he moved, this time into premises capacious enough for a growing trade. Here he accumulated what, at the time, was deemed a competency. The panic of 1837, which swept away numbers of his neighbours, left him unharmed. In 1848, he built the large marble store on Broadway and Chambers Street, and combined the wholesale with the retail trade. A few years later, the exigencies of a business, to the expansion of which there seemed no limit, compelled him to separate the branches, and for the retail department he built the immense structure on Broadway, from Ninth to Tenth Street, and extending to the Fourth Avenue. This retail concern is said to cover an area of two and a quarter acres, is eight stories in height, and it cost nearly three millions of dollars. In the two establishments about two thousand persons

are employed, the annual current expenses are set down at a million, and the value of goods sold has in recent years averaged fifty millions of dollars, or about ten millions of pounds sterling.

These stores, vast as they are, represent but a small part of Mr Stewart's business. He owned silk, cotton, and woollen manufactories, with agencies in various parts of the States, Canada, and England. He had correspondents all over Europe. His purchases of silks, printed calicoes, lace, gloves, and woollen goods, were on a stupendous scale. Of course he employed a vast number of trustworthy assistants. In his pay-roll were included seven thousand persons. But like all who are set on doing well, he personally saw that every one was at his post and doing his duty. He allowed no nonsense, no perfunctoriness in the performance of obligations. From himself, he exacted the most scrupulous attention, even as regards what some would deem trifles. In matters of business, trifles are unknown. The Duke of Wellington, while carrying on his grand Peninsular campaigns, had an eye to the smallest concerns. He knew to a nicety the proper shape of a soldier's shoe, and how many hob-nails should be on the sole. That was eminently consistent with common-sense, for any shortcoming in the article of shoes might have ruined everything. In his multifarious business, Stewart was a kind of generalissimo, with the eye of a detective. 'He began the day in his retail store immediately after breakfast, and traversed every one of its capacious floors, his eye taking in the smallest details, and his pursuit of economy extending to the paper and twine used in the making up of parcels. He would rebuke a salesman for wasting a yard of string, and laid down a code of laws vexatious in its fines and rigid in its administration. The employés, male and female, on leaving the premises, passed before the skilled eye of an inquisitor. From the retail store he soon went to his wholesale place of business, where he remained until six in the evening. This was the routine of his life.' He does not seem to have taken much of amusement, even when his wealth was reckoned by millions. There, he undoubtedly was wrong. Recreation of some sort is necessary, if only to give rest to the brain; and we can imagine that, by taking things more easily, he might have lengthened his days. With him, attention to business was a fanaticism. He is spoken of as being a hard taskmaster to the clerks and workpeople about him. The chiefs he paid liberally; to the rank-and-file he gave the lowest market price for the service they rendered. He neither sought nor got their love. And yet he was a just man according to the strict letter of the law. What he engaged to pay, he paid; what he was entitled to receive, he exacted to the last farthing. The anecdotes told of this stern severity are anything but pleasing. Yet Stewart could do generous things when suggested by his caprices or charitable feelings. In doing them he took his own way. He freighted a ship with food which he sent to Ireland during the famine, bringing back a load of young men and women for whom he had provided employment. He bestowed a gift of ten thousand dollars to the starving operatives of Lancashire in 1862. He sent a hundred thousand dollars to the Sanitary Commission during the Civil War. He gave a hundred thousand dollars to Chicago for the relief of

certain classes of sufferers from the great fire. These are bright spots in the career of one of whom the multitude are now inclined to speak somewhat harshly.

Looking to Stewart's vast success as a tradesman, there must have been something in his method of doing business beyond what we ordinarily encounter. As far as we can learn, he was immensely indebted to a rigid adherence to the simple rules of honesty. He abhorred all trickery, finesse, and double-dealing. In his small beginnings he had a choice of two courses. One was to follow the ordinary routine of lying and pretence; the other, not to swerve in the slightest degree from downright truth, although at the risk of losing by his candour. For example, when shopkeepers generally did not mind representing an article left over from a former season as being quite the fashion for the coming autumn, or when they tried to get rid of a poor piece of goods at the price of one of superior quality, Stewart struck out a new and original plan of dealing. This novelty consisted in treating his customers with scrupulous justice and honesty. Any assistant was punished with dismissal who was found praising an article of doubtful value, or palming it off for what it really was not. A reputation for trustworthiness in his salesmen by and by spread over not only New York but distant parts of the country. The farmers soon came to know that when they made their periodical visits to the city they could buy all the finery which their wives and daughters wanted, without the slightest fear of having their innocence imposed upon. The Irish servant-girl, when she received the wages that seemed so large to her unaccustomed eyes, was satisfied that when she entered Stewart's stores she would get the value of her money as well as if she were a lady who had stepped over from Fifth Avenue.

Thorough honesty was thus the predominating cause of Stewart's success, but there were other material accessories. He sold only for ready-money, and he sold everything at the cheapest rate at which it could be afforded. In going to his store you were sure to get the best article for your money. Losing nothing by bad debts, he incurred no losses by taking credit. Paying for all his purchases in cash, he got them at the lowest price, while he was saved all the trouble and misexpenditure of time that would have ensued by giving bills. These are points on which beginners in business do not sufficiently cogitate. Often, they rush into transactions on credit, trusting somehow to get out of the difficulty, and are ever kept in a miserable state of expectation. Half their time is spent in contriving how to raise the wind. Obviously, all this is bad. Abilities are frittered away in paltry contrivances which never should have existed. There is no reason why this ought to be. If people, as Bailie Nicol Jarvie says, would only not put out their hand further than they can draw it in, they would save themselves no little perplexity. The error is, starting without the means on too grand a scale, living beyond the means, and so forth. Then follow bills upon bills; the plain English of which is carrying on business on borrowed money. The result is too frequently a proneness to living beyond available means; and although banks for their own sakes are wonderfully accommodating, the catastrophe usually comes at last.

Let us, within reasonable bounds, do honour to Stewart in his wisely considerate principles. He hated credit, he hated lies. He was not very genial, not fashionably absurd, but acting on prudential considerations, he let things take their chance. . . What more, in a business point of view, can any one be expected to do? Stewart was not in all respects a non-such. But as things go, who is perfect? In his tactics from first to last, we are greatly reminded of that eminently successful London merchant, whom, under the designation of 'Old Bob,' we made an effort to describe in these pages in the early part of the present year. And it is a pleasant thing to know that two men so alike as regards their assiduous industry, their foresight, and business qualities, should have been contemporaneous on opposite sides of the Atlantic. Both were a type of the extreme business fanatic, with a dash of culture in social and refining pursuits. In his devotion to business and to money-making, Stewart, it is stated, 'never lost the flavour of his earlier associations. He loved pictures—at least he loved the collecting of pictures. He went into the business of collection in the methodical way which belonged to all his pursuits. His agents scoured Europe every season in search of expensive works of art. He had built in Fifth Avenue a palace of white marble as his private residence, with a fine gallery for his pictures. There he entertained all manner of strangers, including many a travelling Prince and Grand-duke from Europe. It is said in New York that the white marble house was to be made a bequest to the city, with its gallery of paintings, for Mr Stewart had no child to inherit his enormous wealth.'

It is saddening to think that in human life a time arrives when success in the most agreeable and honourable pursuits comes to an end, and that there is nothing left but the cold and silent repose of a coffin six feet under the surface of the earth. Happy is the man who so lives as to have hopes beyond the grave, and who, in bidding the world adieu, leaves it some worthy memorials of his earthly pilgrimage, if only to shew that he has not altogether lived in vain :

Earth goeth on the earth glistening in gold ;
Earth goes to the earth sooner than it wold ;
Earth builds on the earth castles and towers ;
Earth says to the earth, all shall be ours.

Alexander Turney Stewart, after a career of commercial success so extraordinary as to be scarcely paralleled, lay down, sickened, and died, early in the present year. All his gigantic undertakings were abruptly left without a head. He cannot be blamed for dying ; but those who admired his diligence and integrity, would like to have to point to any great work consistent with his opportunities which he effected in his day and generation. Apart from the generousities to which we have alluded, and possibly some other charitable acts which did not sensibly trench on his massive fortune, there is absolutely nothing to record of his beneficence. He threw away opportunities of doing good such as few men possess, and so far deprived himself of honours and pleasures which amply lay within his reach. Nor had he the heart or the fortitude to be posthumously a benefactor. Prompt in his decision in everything else, he could not decide what he should do with his money. In this there was a

curious phase in human nature. Some men are unable to make up their mind how to destine their property after they shall have hidden it farewell for ever, and feebly, they leave all to take its chance. The only excuse that can be offered for Stewart's indecision is often the difficulty of knowing to a certainty what in the way either of donation or bequest will prove really serviceable.

According to popular report, Stewart left at his death property to the value of four millions of pounds sterling—though some make it as much as ten millions. At anyrate, and as a result of indecision, the sum-total, with exception of some legacies, was bequeathed to his wife, who was to be assisted in the administration by Judge Hilton. What is to be the upshot, no one knows. As for the great Merchant Prince, it was resolved to give him a public funeral on a scale which we in England are happily disinclined to parallel. We are told that the body was laid out in state in an evening dress, with white necktie and pearl buttons on the snowy shirt bosom, the deadly pallor of the cheeks being skillfully touched up with a little rouge. For anything like this we would need to go back to the dementally fashionable ladies in the reign of Queen Anne :

'Odious ! in woollen ! 'twould a saint provoke,'
Were the last words that poor Narcissa spoke :
'No, let a charming chintz, and Brussels lace,
Wrap my cold limbs, and shade my lifeless face :
One would not, sure, be frightful when one's dead—
And—Betty—give this cheek a little red.'

So, Stewart, the Merchant Prince of New York, after the manner of Pope's Narcissa, was furnished up and painted for the tomb. We cannot go into an account of the funeral cortège, with its vulgarly gorgeous trappings, or the sensation that the whole affair created among the obsequious worshippers of mere wealth. We respect Alexander Turney Stewart for his honesty in business and other good qualities ; we rejoice in his deserved prosperity ; but lament he should have done so little good with his prodigious wealth ; and regard with pity and contempt the fantastic soppories of his funeral.

W. C.

FALLEN FORTUNES.

CHAPTER XXIX.—MR HOLT ASKS MAMMA.

Is it worse for us who depart from this world and all we really love (because from all of which we have any practical experience), or for those who love us and are left? Surely—let us reverently hope—infinity worse for them. If not, woe indeed to man, and misleading as the marsh-fire all the flame of faith, the glow of aspiration. And what (we hope) is true of a death-bed parting, is certainly true of those foreshadowings of it, a man's departure on long travel, or emigration across seas, or to the wars. He has gone to his business, and will be more or less taken up with and immersed in it ; while those at home who are dependent upon him, or on the result of his labours, have to face the void that he has left by the fireside and at the board. New scenes, new companions, distract and employ his mind ; but *they* pursue the same small round of life, and must needs miss him from it.

As to Edith Dalton, there was not an hour of the day during which the fact of her husband's departure

was not brought home to her with a bitter pang, nor a single minute during which the consciousness of it did not oppress her with a weight like lead. Her only solace was found in her children, and she longed above all things to find herself alone with them, under a roof of their own, no matter how humble. Widowhood is respected by all; no friends, except the nearest, trespass on its privacy, when bereavement is yet new and strange; and was not *she* bereaved, who knew so well that she should never see her lost one more? No one could fathom her wretchedness; yet, despite her utmost efforts to conceal it, even the shallowest could perceive that she was wretched. There was something beyond mere pathos in her looks and tone—though, indeed, she spoke but little—that impressed itself on all who saw her; and it was from a sort of awe which she thus awakened, and not from mere pity (as her hostess endeavoured to persuade herself), that Mrs Campden shrank from continuing that conversation with her guest which had been cut short by Dr Curzon's call. The topic she had wished to introduce—her plan for raising the broken fortunes of the Dalton family—she had indeed, as we have seen, confided to Kitty, and in doing so (though it would have staggered some people) she had experienced little embarrassment; but to speak of it *now* with Edith was another matter. She would at least try, in the first place, whether Mr Holt could not be made to speak with her for himself. He, of course, was the proposed topic; and a marriage between him and Kate the plan that Mrs Campden had hit upon to relieve her relatives from their embarrassment. There were many reasons to recommend it to her. It was the shortest way, and it was the cheapest way, since it would not only involve no outlay in itself, but prevent the necessity of helping the family, whom it would indeed be an impertinence to assist, when they had acquired so wealthy and near a connection as the prosperous stockbroker. Besides these very natural arguments, I am afraid—for I regret to have to hint at such a weakness in so eminently Christian a lady Mrs Campden was rather pleased at the notion of the once universally admired Kate's acceptance of this very second-class husband. Her design had been unfolded pretty quickly to the object of her good intentions, but not before it had been guessed by Jenny, who, upon the first opportunity, as has been shewn, had expressed her strong disapprobation of it; for upon the nature of the 'sacrifice,' for which she had endeavoured to shew there was no necessity, there could scarcely be a doubt.

Moreover, Mr Holt himself was perfectly aware of the scheme laid by his hostess for his domestic happiness, and also for the reasons that prompted it. He knew that he had not been asked to stay on at Riverside—for even yet, after the departure of the friend who was his *raison d'être*, the cause of his being there, he was still pressed to do so—for nothing. The invitation had been given by his hostess without a word of endorsement from her husband: that gentleman endured his presence with much patience, but gave no sign of appreciating it; but Mrs Campden, who had been wont to treat him with such scant civility, was now all smiles and courtesy. In public, she paid him the most marked attention; in private, she was even more familiar with him, but it was a familiarity that bordered on contempt. She thought he was shilly-

shallying; that he had 'let the grass grow under his feet,' in prosecuting his addresses to her young friend, and had no scruples in letting him know it; and this was done—such was the adroitness of the female conspirator—without actually indicating the matter on hand. They used the same delicacy that receivers of stolen goods are said to employ when speaking of their effects, while at the same time they went to the point. They were talking together on the morning that succeeded Dalton's departure, and just after the carriage had been despatched with the three girls to the Nook, where they were to employ themselves all day in getting matters ready as quickly as possible. For once, Mrs Dalton had 'broken down,' and though it was understood that she would make her appearance at luncheon, had not quitted her room since her husband left it.

'Well, Mr Holt, the young people have deserted us again, you see; you have not too many opportunities, I fear, of making yourself agreeable. Yet I am sure I do all I can.'

'You are most kind indeed, Mrs Campden. But you would not have had me volunteer to accompany the young ladies to Sanbeck, when they declined the services of even Mr Derwent—a much older acquaintance?'

'Oh, Geoffrey is of no consequence one way or the other,' answered Mrs Campden pettishly; 'though, no doubt, he would be better out of the way. It might have been dangerous to volunteer; but then one must risk something. They will be settled in their new home in a few days, remember, so that there is very little time to spare, certainly none to waste.'

'Yes; but I have known her such a very little time,' remonstrated Mr Holt, with heightened colour: he had never gone so far as to mention 'her' before.

'True; but you must recollect that she is a very intelligent girl, and will make every allowance for the circumstances. Indeed, Mr Holt, it is idle to blink the fact, that the present conjuncture of affairs is very much in your favour.'

He knew all she meant, just as well as though she had said: 'This misfortune of our young friend is your opportunity; unless it had occurred, you would have had no more chance of marrying this girl than of getting the moon;' yet, outwardly at least, he did not vince. His dead-cold eyes were here of advantage to him, for they betrayed nothing.

'Why don't you ask her?' continued Mrs Campden, impatient at his silence.

'She is so cast down and out of spirits just now,' pleaded the other.

'What! because Mr Dalton has gone to Brazil? What nonsense! It is not as if the man were dead. On the contrary, there is all the more reason why, having lost fortune and father, she should welcome a cavalier.'

But the assuring smile with which the lady spoke was by no means reflected by her guest.

'My dear madam,' said he gravely, 'I dare not, and that's the truth. If her answer should be "No"—it seems foolish to say so, no doubt—but if it was, and I fear it would be'—

'It is foolish, Mr Holt,' broke in the other, with irritation: 'you are too diffident, too deprecatory of your own advantages. She would be mad to refuse such an offer; and if she did, it would only be for

a time. We should make some opportunity, a few weeks hence, of getting you back at Riverside—trust to me for that—and you would find her wiser by then. A few weeks at the Nook will tire her of cottage-life, or I am much mistaken.'

'Madam, I dare not do it,' answered Holt earnestly; his face fairly quivered with emotion, his forehead was damp, and his voice hoarse and low.

If he had been courting her own Mary, and betrayed this agitation, Mrs Campden would have graciously accepted it, as the homage to her daughter's charms, and still more to her exalted position, to which he might well feel it was madness in him to aspire; but in the present case she had no patience with the man's folly.

'I do not see anything to be afraid of, myself,' answered she contemptuously; 'you know the proverb, "Faint heart never won fair lady." Still you may approach the matter by another route. If you will not make your application direct, what do you say to "asking mamma?"'

'I would rather do that—much rather,' was the unexpected reply.

Mrs Campden could not understand how he could dare the cannon's mouth, and yet shrink from that of a drawing-room rifle. She did not comprehend—perhaps she was incapable of comprehending it—that Kate was to this man a divinity, to be approached with fear and reverence, and in whose hand, as it seemed to him, lay the issues of happiness and misery. However, she was well pleased to find that he would make his attempt in any way; and it was decided that he should do so, should an opportunity offer itself, that very afternoon, while the young ladies were at Saibek.

It is fair to the hostess of Riverside to say that she did her very best, when her guest and kinswoman came down to luncheon that day, to simulate sympathy for her forlorn condition; the genuine article she did not possess, and therefore could not offer it, but she shewed her pity, with only a very slight alloy of condescension. Where she did (though perhaps unconsciously) exhibit her sense of her own superiority, and of the change in their relations, was in her behaviour to Jeff. Hitherto, the presence of Mrs Dalton had always had a mitigating effect upon her denunciation of the lad's delinquencies, but why should she spare him now, when that lady's opinion of her was so much deteriorated in value? He had done nothing especially wrong that day, but she was especially angry with him, mainly on account of his being at Riverside at all. Mr Holt had dropped an expression or two which had led her to imagine that he looked upon the lad, if not actually as a rival, still as an obstacle to the accomplishment of his design; and though she had spoken of him, as we have seen, contemptuously enough—'Geoffrey is of no consequence one way or the other'—she secretly agreed with Mr Holt that there was danger in the boy.

On this occasion she seized the opportunity of the conversation turning upon Dalton's departure, to praise action and decry indolence. 'Even if your husband gains nothing else by his expedition, Edith, he will have the satisfaction of knowing that he did his best: anything is better than eating the bread of idleness or dependence,' and she cast a look of sovereign displeasure upon

Geoffrey Derwent, as she emphasised the last three words.

Jeff coloured to the roots of his curly hair, but answered nothing, only stole a glance at Mr Campden, who moved uncomfortably upon his seat. He knew that duty called on him to defend the boy. He had told him scores of times, with his own lips, that to his father's liberality and friendship he was indebted for his own *existence*, and that he need never feel any sense of obligation for any favours that he received from him and his; that Riverside was his home; nay, he had even hinted—and most certainly had intended it so—that Jeff need not concern himself about his future, for which he, Mr Campden, would take care to provide.

'My dear,' said he, cutting a large slice of roast-beef with unnecessary haste and vigour, 'it is all very well to talk of indolence; but in these days, the professions are all so full, and for that matter, the trades also, that a man can't always find work to his hand.'

'A man can always do something,' Mr Campden, returned his wife severely; 'and my remark holds still more truly of a boy.'

'Well, of course there is commerce, my dear; but I have withdrawn from it so long, that I have no longer any influence; and remember, to get a lad into a good house, a large premium is required, even when he gets no salary.'

Mr Campden helped himself to walnut pickle with complacency; he had hit the nail on the head, he flattered himself, by shewing that it was cheaper to keep Jeff at home than to send him away.

'I am not speaking of commerce,' answered Mrs Campden acutely; 'of course people that have no money must do as they can. There is the merchant service, for instance, where, if so happens, you *have* interest; and though Geoffrey has been allowed to waste some years of his life in luxury and idleness, your influence would overcome the objection to employ a lad of his years. He cannot expect, of course, to rise at once to the top of the tree.'—

'The cross-trees,' suggested Mr Campden, with a feeble smile.

'I say, no boy who goes to sea,' continued Mrs Campden, frowning, 'can expect to be an admiral at once.'

'Not in the merchant service,' murmured her husband, but this time in confidence to his shirt-collar, 'because there are no admirals.'

'Yet I cannot imagine any lad of spirit not preferring honourable employment, however humble, to living upon the bounty of his friends.'

'My dear, my dear!' ejaculated Mr Campden imploringly; 'you have hurt the lad's feelings.'

Jeff had risen from his seat, and leaving his unfinished meal, walked straight out of the room. Mrs Dalton, who had sat a silent spectator of the scene, had lifted her hand to lay it upon his sleeve, but had been too late.

'I fear, Julia, you have gone too far,' said she in a firm but gentle tone.

'It's an infamous shame!' cried Tony, with a burst of boyish passion, as he ran out of the dining-room after his friend.

Mrs Campden's face was white with wrath, with that trifling but prominent exception of the tip of her nose.

'You may all express what opinion you please,' said she, 'and couch it in what terms you please; but if anything I have said shall have stung Geoffrey Derwent into doing something for himself—it being such high time—I do not regret it.' And with that, like a frigate who has just delivered both broadsides with crushing effect, she sailed triumphantly out of the room. Mr Campden muttered, 'eh, tut!' his note of dissatisfaction when his wife had performed any more than usually high-handed act, and followed her in nervous haste, so that Mrs Dalton and Mr Holt were left alone together.

'I regret,' said he—'I deplore above all things that our hostess should exhibit this inimical feeling towards Mr Derwent, who appears to me to be a most inoffensive young man.'

'He is better than inoffensive, Mr Holt,' replied Mrs Dalton gravely; 'he is a most excellent lad. I have known him from a child, and have never detected a single serious flaw in his character: a more honest or more unselfish nature I have never met with. Not the least regret that I feel for our own change of fortune is, that we are now powerless to help poor Jeff.'

'But I am not powerless,' observed the other quickly; 'that is to say, if the possession of some stake in the world of commerce can be called power. And you may be quite sure, Mrs Dalton, that whatever aid I can offer to any friend of yours will be most gladly—most eagerly—afforded. It is very obvious that the poor lad's position here is uncomfortable, if not untenable; and if you think a responsible position in my office is worth his acceptance, he is very welcome to it, and I think I may venture to say, that in that case, no one need trouble themselves about his future.'

'My dear Mr Holt, you are most kind,' said Mrs Dalton cordially; 'I could not have hoped to experience to-day, or any day, such pleasure as you have just conferred upon me. To take a lad like that, without experience, or recommendation—'

'Pardon me,' broke in the other, waving his hand gravely; 'do not say without recommendation, for since you have praised him, Mrs Dalton, he has the very highest in my eyes.'

'You are very good to say so, I am sure; but the fact remains, that out of pity for this poor lad's position, you have offered—'

'Nay, madam, I must interrupt you once again,' said Mr Holt earnestly, 'lest I should take credit for a virtue I do not possess. That I pity the lad is true enough, but it is solely for your sake that I shall take him into my employment. You may consider the matter as arranged, and I am profoundly gratified at having had an opportunity of affording you pleasure.'

'I know not how to express my thanks, Mr Holt. If my husband were here indeed, the fitting words would not be wanting; and when he comes to know what you have done, it will rejoice him, I am sure, almost as much as myself.' Her voice fell, her eyelids drooped, as she thus spoke: the mention of the absent one had frozen the springs of her short-lived joy.

Holt cursed his quondam friend in his heart, who had thus rendered his proposed task more difficult. A few moments ago, he thought he had 'seen his way' to the subject he had in hand; Mrs Dalton's manner had been genial, and even

encouraging; and now it seemed that he had all the work to do over again. Nevertheless, desperation urged him on.

'Your husband's absence, dear Mrs Dalton,' said he, 'is regretted by no one, out of his immediate family circle, so deeply as by myself; indeed, no one has more cause to regret it; for had the necessity for his departure not arisen—taking us all by surprise, and precluding all other matters, as it did—I should have ventured to put to him a question of the most vital interest to me.'

Mrs Dalton bowed; her face was a little paler, and her lips met together with unusual firmness, but she shewed no other sign of emotion; yet she knew what was coming quite well.

'Might I put the question of which I speak, to you, madam?' inquired he, after a little pause.

'Most certainly you may, Mr Holt.' Her voice was firm, but she had grown paler than before, for the words Mrs Campden had spoken to her on board the steam-yacht, about this very man's possible pretensions to her daughter's hand, were ringing in her ears: 'I should as soon have imputed to her an attachment to the footman.'

And now, in a few short weeks, so great a change had befallen her and hers, that Mr Holt was about to ask for her daughter's hand, at the express instigation of Mrs Campden herself. Her pride was wounded, and her heart was sore; but, except where her affections were concerned, which sometimes overpowered her—as we have just seen in Jeff's case—she had learned to repress her feelings.

'What I have to ask is a great favour, Mrs Dalton; in comparison with which all that I could ever do for you fades into insignificance, and which will leave me your debtor for ever: it is, that you will give me permission to speak to your daughter, Kate, as her suitor. I am well aware of her superiority to myself in all respects; of the social gulf between us, which I am the last to conceive has been in any way narrowed by reason of your recent misfortunes. I am only a plain, blunt man, who is devoted to her.'

It was impossible to mistake these words—which were spoken with a certain homely eloquence, that won the listener's ear in spite of herself—for anything but what they were, the genuine utterance of the speaker's heart. His cautious business manners, his Frenchified airs, were gone, and were replaced by an intense anxiety and earnestness. The very existence of the man appeared, to all seeming, to be in abeyance; he neither moved nor breathed as he waited for his companion's reply.

'I must needs say, Mr Holt,' answered she, with deliberation, 'that your question gives me great embarrassment. Its suddenness—to say nothing further—has taken me utterly by surprise. I am fully conscious, believe me, of the honour you have done my daughter in making this application. The gulf you speak of might well be considered—and doubtless is so—upon your side rather than hers; for you are rich, and she is penniless; but—but I have no authority to grant your request. When my husband returns, it will be surely time enough to apply to him for the permission you demand. In his absence, I must decline—with heartfelt thanks to you, Mr Holt—to take any action in this matter.'

'And do I understand, madam, that you also forbid me to apply to your daughter herself—to hear from her own lips whether I may look for hope or not?'

'No, Mr Holt; I have no more authority to forbid than to encourage you in this matter. My daughter is old enough to know her own mind. At the same time, I would venture to suggest, that a time like the present, when she has been deprived of her natural adviser, as well as smitten by sore misfortune, is scarcely one suited for a proposal of marriage. If you have that genuine regard for her (and I do not doubt it) of which you have spoken, I think it should lead you to spare her, at a time like this, a declaration which I feel sure would be a source of pain.'

'On account of its inopportuneness?' put in the other eagerly.

'I don't say that, Mr Holt; pray, do not force me to express an opinion that may sound harsh or uncivil. I am merely pleading for Kate, that you should not—forgive me for the word—impertune her upon this matter for the present.'

It was now Mr Holt's turn to bow and not to speak. His face exhibited a chagrin, and yet a resignation that went to Mrs Dalton's heart; she never thought (as she afterwards said) she could have felt so keen a pity for the disappointment of such a man.

'I am very sorry for you, Mr Holt,' said she, 'very sorry;' and he knew that, so far as she was concerned, her words were words of doom.

THE AQUARIUM.

PART II.—ITS INHABITANTS.

WE will imagine our aquarium healthily established in its vegetation. A crystal globe or tank of bright clear water, with plants of the pretty long-leaved valisneria, chara, and perhaps a water ranunculus floating at the top, all in their healthy growth giving off bubbles of pure oxygen when exposed to the light. At the bottom of the tank is a bed of clean river-sand, with bits of rock or stones lying about, and forming tiny caves or nooks for the retirement of any of the expected tenants of the pool. It has required perhaps a fortnight of patient waiting to accomplish this condition of things, and careful attention in removing every dead or decaying bit of vegetation. The tank has been shaded from too hot a sun, and exposed to the bright light of a warm aspect only occasionally. Were it left in a window with sunlight constantly upon it, the green vegetable matter called *conservæ* would increase and grow so rapidly as to destroy the other plants, and forming a green shiny film all over the light side of the glass, would obscure it entirely. This green film must be daily cleared away and the sides of the glass polished. A bit of clean sponge tied on to the end of a stick answers this purpose well, and if used daily, is sufficient to keep the glass clear; but if the *conservæ* be neglected, and allowed to establish itself, scrubbing will hardly remove it from the glass. Almost the first inhabitant that is tried in a fresh-water aquarium is a stickleback; he is so easily caught, and is the

first game of the youthful British angler. A bit of meat at the end of a piece of string entices him, and having once seized it, he never lets go till he is dragged out of the water and opens his mouth to gasp for breath. He very soon accommodates himself to new quarters, but asserts his sovereignty at once, allowing no intruders, and usually commencing his despotic reign in the aquarium by attacking all rivals. It is best not to attempt to establish an aquatic 'happy family' rashly. The mild and pleasant little gold and silver fish live peacefully with their neighbours; but the truculent stickleback is a fish to be wary of in the way of introduction. Let him have a habitation to himself with one or two of his own species, and he is delightful to watch and beautiful to behold. He will repay you for his disposition. He has all the ways of other fish, and many more besides. He and his family are found both in fresh water and in salt. It is almost a matter of indifference to them in which they live. In Yarrell's *British Fishes* we find seven distinct sorts of sticklebacks described, according to their peculiarities, number of fins, &c., and in each case it is mentioned that they are found 'indiscriminately in salt or fresh water,' in every river, brook, lake, and all round our coast from Land's End to the Orkneys.

It is the male fish that is the pugnacious one of his tribe. We have no Amazons among fishes. The habits of the female stickleback would satisfy the strongest opponent of 'woman's rights,' for she grows very fat, never assumes the brilliant colours of the male fish, and remains at home occupied with domestic cares. Her warrior partner, however, does not throw the entire burden of the establishment on his weaker half. After clearing the neighbourhood of all intruders, by using his sharp, well-directed spines much in the way that a Chinaman or Japanese wields his knife and rips up his enemies, he sets to work to *build a nest* and to rear a family. Look into your tank: there he is—larger than the rest, clothed like a knight of old in a resplendent coat of mail, glittering with purple and gold. See how his eyes glisten, and how with every movement his colours change! His nest being carefully prepared, he gently allures his mate into it, where she deposits her eggs, and resigns them to the care of the hero of the knightly suit, who watches over them with an anxiety known to few of the males in creation besides the male stickleback. He fans and freshens the water with his fins, and superintends the first exit of the little fry with true paternal interest. An account of the nest-building proclivities of the stickleback appeared in this *Journal* (April 23, 1876); and we ourselves have seen, in an aquarium kept by a lady in Aberdeen, a nest built by a fifteen-spined stickleback on a piece of rock covered with fine green sea-weed. For about three weeks the father fish never left this nest save to drive away or destroy all other fish that approached too near. When a stick was put into the water near the nest,

the valiant guardian would fly at it open-mouthed and bite it with great fury. But all his care could not save his little ones from destruction. As soon as they escaped from the nest, they disappeared, being mercilessly swallowed in their infancy by other fish, or entangled in the tentacles of the sea-anemones—for this was a *sea-water* aquarium in which they were hatched. Probably the experiment would have succeeded better had the nest been isolated, and all the other inhabitants of the aquarium removed.

Of course, in small domestic aquaria it is best to have small fishes as inhabitants. The tiny gold-fish we have mentioned as being very suitable, and the Prussian carp, found in ponds in the neighbourhood of London, though not so bright a fish as the golden carp, has a very lively and pretty appearance. The minnow is a sportive little fish, and is seldom more than three inches long. It is generally to be bought at the fishing-tackle maker's, as it is used by anglers as a bait for pike and other fresh-water fish. The loach and the gudgeon live well in aquaria; we have them both, and have kept them alive and in health for three years. Fish in an aquarium should be well watched, and when apparently sickening, should be removed gently in the hand-net, and placed alone in fresh water, where they will often recover. If they are doomed to die, it is better not to run the risk of their doing so in the midst of their healthy companions. We always have a hospital for our sickly pets.

But although at the first glance at an aquarium one is attracted by the active little fishes swimming amongst the bright green weeds, we who watch them daily, and spend many leisure half-hours in attending to them, in clearing away the overgrowth of weeds, and making subaqueous high-ways and paths for their better movements, know that the curious Water-spider (*Erythronecta aquatica*) with his crystal bubble, the queer little Water-flea (*Daphnia*), and the odd family of Water-beetles, are even more interesting, because their habits are more obscure than those of the finny tribe. The spider's brilliant bubble, which surrounds his body, enables him to rise through the water and float about at his pleasure. Diving, he constructs a sort of nest at the bottom of the water. When he wishes to take a journey and ascend to higher regions, he inflates his transparent jacket and floats away; and when wishing to remain on firm ground, dispenses with his air-bubble, and looks like an ordinary spider. He is an easy prey to fish, and cannot well be kept with them, though he may often escape for a long time.

The Great Water-beetle (*Dytiscus marginalis*) is a well-known beetle in our ponds and streams. It is the most ravenous of its kind, and will attack everything eatable; even the stickleback is no match for it, and tadpoles it devours by dozens in a day. Its larvæ are as destructive and tyrannical as itself, and have got the characteristic name of 'water-devils.' The little Whirligigs (*Gyrinidae*) should not be neglected; they are often seen twirling round like opera-dancers on the sur-

face of the water, and are among the earliest harbingers of spring. Beetles fly at night; and unless the aquarium be covered, some of them may take a moonlight-flitting and be lost. The Water Scorpions and the Water Boatmen form pleasant little objects in the water, and the larvæ of various other species of insects may be kept with interest. It is possible also to get a little colony of caddis-worms in their curious little cases, and to watch their habits and ways with much pleasure. But to those who really take interest in matters microscopic, and are furnished with a microscope even of small pretensions, the aquarium will be a constant source of study and delight. The Hydra family, the Polyzon, &c. may be nursed, and reared, and propagated in very small water-space, and are a perpetual supply of interest. Many earnest observers have a microscope so fixed as to catch the surface of the glass of a tank, and to revolve so as to be able to fasten just over any little object to be observed. Diatoms, animalcules, and curious plant-like cells, abound in fresh water, and grow and increase abundantly if left unmolested by larger creatures: *Volvox globator*, a dark-green moving and revolving globe, once thought to be an animal, but now regarded as a plant; and *Euglena viridis*, which some suppose to be a plant, others an animal, and which often gives to water the appearance of green pea soup. Amongst animalcules, we have the curious Sun Animalcule, which has the power of suddenly contracting its tentacles, and thus leaping about in the water. The microscope shews that it has no mouth or stomach, but has the habit of pressing food into its substance by means of its tentacles. The 'bell animalcules' or *Vorticellæ*, are likewise too small to be distinguished by the naked eye. In some species, more than one individual is found on a single stem, forming exceedingly beautiful objects under the microscope. The stalks of these Vorticellæ are thinner than the finest spider's thread, and have the power, while outstretched, of instantaneously contracting, so that a large mass, expanding over the whole field of the microscope, suddenly disappears, and, 'like the baseless fabric of a vision, leaves not a wrack behind.' A little patience, and the beautiful creatures will once more reappear to expand themselves in all their beauty. Then we have the *Rotifers*, with their curious cilia, which have the appearance of little wheels ever in motion; and the *Polygastria* (many-stomached), so cleverly described by Professor Ehrenberg, who, with the most imperfect microscope, made careful observations on this group of animalcules, and determined to his own satisfaction that the little spots in their interior are in reality stomachs. He fed them with a little indigo or carmine, and then these spots became coloured blue or pink, shewing, as he then thought, that they were *many-stomached*. Recent observers doubt his conclusions, but they are nevertheless suggestive and interesting. Then we have the curious little Hydra in almost every stagnant pool in the summer-time, and we have successfully kept a colony of these singular creatures attached to a root of valisneria, which thrived well in a long glass vase—a confectioner's covered jar. Well is it named 'Hydra,' after the fabled monster that multiplied its heads as fast as Hercules cut them off, for no cutting up is

able to destroy this persistent creature. Every individual fragment very shortly becomes a perfect Hydra, which attaches itself to a bit of stick or a plant sending out its long semi-transparent green tentacles to clutch unwary prey that may stray towards it. From this very jar we have often taken bits of valisneria leaf, to make a pretty and instructive object under the microscope, for no plant shews so well the circulation of fluid through the cells and tissues of a leaf. Water-plants, being of less dense tissue than those that grow in the air, are peculiarly adapted for this purpose.

In furnishing our aquarium we must not forget the scavengers, of which we have before written. Certain varieties of Mollusca—snails with shells, in fact—live plentifully in fresh water, and have large appetites for green weeds. They are most useful in clearing off the growth of green conserved, which gathers on the sides of the glass when exposed to light; but care must be taken that their grazing is confined to that pasturage, and that they do not extend their rambles to the growing plants in the aquarium. The coil-shells are the best and least voracious of this tribe, and many of the mud-shells may be safely introduced. The large mud-shell (*Limnaea stagnalis*) is a dangerous fellow, and loves nothing better than a salad of valisneria. When vegetation is too rank in an aquarium, one or two of these fellows will soon clear it off, but they must be removed before the whole is devoured. The beautiful and common marsh-shells, the fresh-water mussel of both kinds, the swan mussel, and the pearl mussel, should be in every good collection; and as they lie at the bottom on the clean bright sand, they look very pretty, and have their use assigned to them in the colony.

We will now, however, imagine ourselves at the sea-side, anxious to preserve and bring home some of the living treasures we have gazed at in the rocky pools at low-tide, but which, on being ruthlessly pulled out of their natural element, have withered and died in a few hours. Even the seaweeds that we collect without injuring or disturbing the roots, droop, and look quite different in our basket, or when spread out on paper, from what they did when floating out in the pool of water, every frond extended, and seeming to give out sparkles of oxygen. Rather than run the risk of losing these pretty green and red weeds so essential to our aquarium—

Coral and sea-fan and tangle, the blooms and the palms of the ocean—

we gently raise the stones on which they grow, or, with a hammer and chisel, chip off some bits of covered rock, and at once carry them to our glass vase or tank, basin or foot-bath, and settle them in a bed of shore-sand with some shells and bits of rock. Take care that there be as little as possible on your bits of rock beside the weed itself. Scrape off any small adherent sponges, and see that no worms have made their tube-homes among the weed-stems; if they have, drag them out, for they will assuredly die, and as surely poison the water with sulphuretted hydrogen, blackness, and evil smells.

In a few days, when the water is clear and you feel sure of your vegetation, begin to make choice of your tenants. In the crannies of the rocks

you will find sea-anemones (*Actiniae*); and a dozen of these are sufficient to turn your glass vessel into a most brilliant living flower-garden. Hanging upon the under ledges of rocks, they look like mere lumps of jelly, but of divers colours. Take them from their piece of rock if you can without injuring them, by slipping your finger under them, or any blunt instrument; if this fail to remove them, try if possible to knock away the bit of stone to which they are attached, and so carry them off bodily in your basket of wet sea-weed. When you get them home, put them into a dishful of fresh sea-water, and leave them for the night. Next morning, what a change! The dull lumps of jelly have taken root and flowered during the night, and your dish is a garden full of the most beautiful and delicate-coloured sea-chrysanthemums, crimson, pink, purple, and orange. Touch one and it shrinks away, shewing nothing but a row of blue turquoise-like beads around its top or mouth, at the root of the petal-like tentacles it has withdrawn. This is *Metabryanthemon*, the commonest of all the sea-anemones, and to be found on most of our coasts. Others there are more gorgeous than he—some like quilled dahlias of all shades of colour. *Craspedocoris* is a large variously coloured anemone; and these two are sufficient to give much variety and interest to the aquarium; but the more delicate and rarer varieties will repay for a search: the beautiful *Anthea*, with its long hanging languid-looking filaments, which it never wholly retracts within its body; the *Callis*, or Sea-daisy, common on the south coast of England; and the lovely rose and white *Dianthus*, which is often brought up in the dredge adhering to oyster-shells or bits of rock. On the whole, however (unless an aquarium be specially set apart for the purpose), we believe it is best not to introduce creatures that live in the deep sea, but rather to confine the collection to such as inhabit the shore between the tide-marks. When your anemones have lived in their probationary dish for a day or two, carefully transfer the most healthy-looking to your aquarium, settling them as well as you can on a stone or bit of rock by means of your wooden forceps or a bit of stick. We once kept a common crimson-bodied anemone, with a row of wonderful bright blue spots like 'celestial eyes,' for several years, and had the satisfaction of seeing it bud and throw off innumerable tiny anemones during that time; none of which, however, lived to attain maturity.

A few tiny star-fishes are pretty in an aquarium; not the coarse five-fingered fellows with yellow bodies, but the beautiful little rose-coloured *Asterias*, which may be found in rock-pools for the seeking. Then you want a scavenger in the shape of a tiny crab, who will gently run about and eat up all decaying bits of food, and hide himself under the rocks when satisfied. Do not trust to a hermit crab; he is too fussy, and restless for an aquarium, and tears up the plants and scuttles about to the discomfort of the other inhabitants. He is very amusing, indeed, when not expected to submit to the rules of civilised aquarium-life. Put him into a basin of water with another of his kind, having gently taken both out of their appropriated shells, and leave one shell in the water for them to quarrel for. It is the funniest sight in the world to watch their

manœuvres and stratagems to secure the shell—the way in which first one and then the other will insert his naked tail into the coveted shell, as if ashamed of being discovered in undress, is not to be forgotten. But this amusement cannot be carried on in a respectable aquarium. You must introduce only a decent little shore-crab with a dingy russet coat, very flat, and able to fold himself up into a compact little object at any moment, and lie still and unobserved in any crack or cranny of the colony. Snails are as essential in a marine as in a fresh-water tank, and there are many varieties with pretty shells which will do the work you want them for, skilfully and surely. The green film which gathers on the sides of your glass, can, as we have already shewn, be removed by rubbing it yourself; but it is best to set three or four live shells to do it for you, 'to keep your subaqueous lawn closely mown.' A few shrimps or prawns, with their transparent bodies and swift, active movements, are desirable to secure; only keep your eye on them, for they have a way of retiring under stones to die without giving any signs of their intention, and then giving off bad gases and poisoning the water.

Of all things, beware of over-stocking a marine aquarium. It bears that process less readily than does fresh water, and is more difficult to renew. Heat and dust are the great difficulties to contend with. If once the water should become hot by exposure to the sun, it is all over with your pets. Yet they must have light, for without it the weeds would not grow; so the only thing to be done is to have a sort of shade or curtain which can be regulated according to the light and heat of your situation. Be careful to use the syringe daily, so as to pump oxygen into the water, and prevent any dust from gathering at the top.

We know how much pleasure such a collection as we have described is capable of giving at the sea-side; how it adds to the interest of the sea-shore rambles, and beguiles many a wet day in-doors. We also know the difficulty of moving the collection up to town; but it can be done by means of separate jars, and cans, and bottles of sea-water, and soon re-established in the midst of the murkiest atmosphere. Moreover, all that we have described—weeds, water, and animals—can be purchased at a established in an aquarium by those who never go to the coast at all. We have seen in London, in a large shop expressly for the sale of 'aquarium stores,' curiosities and treasures unknown to our British coasts, which live and thrive well, we are told, in many private aquaria, where temperature is carefully observed and great care given to all arrangements. For the fresh-water aquarium we saw many coloured spotted water-newts—salamanders they are called—whose native climate is a warm one, and who shed their skins curiously during the year, and cast off their four and five fingered gloves perfect as a model. Then for salt water, we saw a vase full of pretty little Sea-horses (*Hippocampi*), with horses' heads and curly tails; corallines of brilliant hue; serpulæ of bright rose colour; and other zoophytes innumerable. But these exotic treasures are only for those who can afford them, and probably do not yield so much real pleasure to the possessors as can be gained from the associations which naturally arise when we recognise the old friends of our childhood in the 'sea's abundant progeny,'

and recall the scenes and days when first we learned that a visit to the sea-side does not lose its interest when it is over, but may be prolonged through winter frosts and snows, and in the midst of city bricks and mortar.

P. L.

A DILEMMA.

IN TWO CHAPTERS.—CHAPTER I.

MR DUHAMEL and his daughter Claire were alone; but Mr Duhamel was not benefiting by that fact as much as usual, for, strange to say, Claire did not hear a word of his talk. He, in a bright-coloured dressing-gown, was marching up and down the room; she, with the *Times* drooping from her half-unclashed fingers, was leaning back absently in an easy-chair. The sweet air of the summer morning came in through open windows, and set the muslin curtains waving gently; the room was full of scent from great basins of roses which stood on the tables. Claire herself, in her white dress, and her careless attitude, was a charming object. Mr Duhamel thought so, and as he walked and talked, congratulated himself on the beauty of his daughter and the general agreeableness of his surroundings. Only one thing vexed him: Claire was not giving him her attention.

'She might have believed me,' he was saying. 'I am not in the habit of making mistakes, and I always told her what would happen. I could and would, have arranged a nice, suitable, satisfactory marriage for her more than once while she was young; but she was obstinate—a real Englishwoman—must choose for herself; and see what it has come to! An old maid! But I always knew how it would be! And there's our poor neighbour, Sir George, the moment he quarrelled with his step-mother, I told him he had ruined himself. I told him she would marry again, and she *has* married; and not one penny will he ever get of all that his father left her. I have told him so fifty times, and you know I am a pretty good prophet.'

When Mr Duhamel's voice ceased, Claire lifted her eyes languidly, and said, 'Yes, papa,' but with so little interest, that her thoughts were clearly occupied with something else. Her father stood still, and examined her face.

'What are you thinking of, my child?' he asked, after a moment's silence.

'Can't you guess, papa?' she answered with a half-smile. 'What am I most likely to be thinking of?'

'Of Eugène, of course,' Mr Duhamel replied, beginning to walk up and down again. 'I will tell you more than that: you are thinking some misfortune has happened to him.'

Claire raised herself and spoke with some energy: 'He has never before missed writing every mail; two mails have come in now without a letter from him. Have I not reason to think something is the matter?'

'Nothing is the matter,' her father said with decision. 'He has a reason for not writing, no doubt, but none that need trouble you.'

'What can it be, then?'

'Suppose he were on his way to England?'

'Ah! that would be delightful; but then he would write to say he was coming.'

'My darling, I have never seen Eugène, any

more than you have, but I can tell you that he is romantic.'

'Not a bit romantic, papa; at least, not a bit too romantic.'

'Let me go on. He is romantic. You and he are engaged by the arrangements of your respective fathers; you have exchanged likenesses, and have written to each other a great many long and very delightful letters. You love each other. What now remains but that you should meet? Eugene has finished his business in South America sooner than he expected; he is impatient to see his fiancée; what more natural than that he should resolve upon surprising her with a visit?'

This time Claire fairly jumped from her chair, flew to her father, and seized both his hands. 'O papa, you have a letter! Oh, cruel; tell me all about it directly!'

Mr Duhamel took his daughter's two little hands into one of his, and patted them with the other, as he looked down into her face with a smile of loving superiority. 'A letter? No, my child. But your father was not born yesterday. He knows the world a little, and men too—even lovers.'

Claire's face sobered, but was still turned trustfully to her father.

'You really think that's it? But his name is not among any of the lists of passengers.'

'Silly child! How could he surprise you, if he allowed you to read his name in the papers? There's no law against inventing a name for one's self, is there?'

Claire's face gradually broke into a smile. 'Ah, if I could only believe that,' she said, and went back to her chair.

'Mind, I don't say *positively*,' Mr Duhamel went on, with a sly smile; 'I don't say it *is* so; but I am a pretty good prophet, and we shall see.' With this oracular sentence he walked out of the room; and Claire, much comforted, devoted herself to the contemplation of a small portrait which she wore in a locket.

While Claire studied the counterfeit presentment of her never-seen fiancé, and Mr Duhamel prepared himself for his morning walk, a very animated conversation was being carried on by two other people, who had met midway along a path which led to the house from a small side-gate of the garden. Of these two people, one was a lady, and the other a gentleman; the very lady and gentleman over whom Mr Duhamel had been lately lamenting: his niece (or rather his late wife's niece), Anne Burton; and his neighbour, Sir George Manners. Anne was what some might (erroneously) term an old maid; she was not quite thirty, and made no effort to appear younger. She was tall, neither stout nor thin, had plenty of pretty brown hair of her own, and a graceful figure, set off by a well-made gray dress. Sir George was a tall man, broad-shouldered, and not particularly handsome; not so handsome as Anne, by any means, yet pleasant enough to look at; certainly not poverty-stricken in look or dress, and at this moment very far from being oppressed by care.

'What will my uncle say?' Anne asked, laughing softly, as she twisted a rosebud about in her fingers.

'I expect he'll refuse to believe it,' Sir George answered. 'I shall have to bring all the docu-

ments to shew him—her letter to me after she quarrelled with her husband, the notice of her death, and Payne's letters about the will, &c.'

'It would be mere hypocrisy,' replied Anne, 'if I were to pretend to be sorry she is dead. She did you a great wrong by coming between you and your father.'

'And another by coming between me and you.'

'But that was your own fault,' Anne answered quickly.

'Give me that rose,' Sir George said; and made use of the excuse to take the lady's hand into his, very much as if she were a young maid. 'I had not courage to speak while I was poor, you see; but since you waited for me, all is right.'

Anne laughed, and, in spite of her thirty years, blushed, as she drew her fingers away. 'You will miss your train,' she observed.

Sir George looked at his watch. 'Plenty of time,' he answered. 'Ten minutes to see your uncle, if I must see him, and a good hour to drive to the station in. I'd rather stay here for the ten minutes.'

'No; you must go in, lest anybody should have noticed you. After to-morrow, you can come to visit me, if you like; at present, I am nobody.'

'Good-bye, then. I shall see Payne this afternoon, and if necessary, to-morrow. At the latest, I shall be down by the four o'clock train, and will come over here at once.'

'My poor uncle! It is a bad return for all his kindness, to prove him a false prophet.'

A minute or two after saying this, Anne went on alone through the garden-gate; and Sir George, with a rose in his button-hole, rang the door-bell, and asked for Mr Duhamel. Claire dropped her locket hastily as her father and Sir George came into the room together.

'Just off, are you?' said Mr Duhamel. 'Why, you look like a bridegroom already; and you are right, you are right. The lady won't say "No."'

'I hope not,' replied Sir George laughing; and Claire looked at him with sympathetic eyes.

'No, no. And I'm glad you've learned wisdom at last. A baronetcy on one side, a fortune on the other; a reasonable bargain, and one I always foresaw you would make at last. I am not in the habit of making mistakes.'

'But, Mr Duhamel, I never said I was going to be married, still less that the lady was rich.'

'No need to say it, my dear sir—no need to say it to me. But you can't say you're not thinking of marrying?'

'No.'

'Nor that you are looking forward to love in a cottage?'

'No. But my time is up. Good-bye.'

The visitor went, and Mr Duhamel followed him with a regretful glance, sighing 'Poor Anne!'

Half-way to the station, Sir George met a shambling fly with two young men in it. One of them was looking out, and it could be seen plainly that his dark, good-humoured face was that of a stranger. 'Who can that be?' said the baronet to himself. 'Claire's Eugene? Mr Duhamel prophesies that he will be here unexpectedly, and he may be right for once.'

But the young man who had looked out of the fly was not Eugene Bertrand, for his companion called to him: 'Do sit still, Marco, and give me your advice.'

Marco dropped back into his corner, and began to excuse himself in Italian.

'English! English!' cried the other. 'What have I told you?'

'Yes—I know,' answered Marco, bringing out each word by a separate effort of reflection.

'You tell me,' continued the first speaker, 'that I speak Italian as well as you do. My English friends have often said the same to me of their language. How do I do it? By *forcing* myself always to talk the tongue of any country I happen to be in.'

'Yes—I know,' said Marco again.

'Very well. Remember, I don't understand a word of either Italian or French as long as I am in England. And now, tell me, how am I to do it?'

'*Poveretta!*' began Marco, and then corrected himself. 'Poor girl! I am so sorry for her.'

'Poor girl indeed, for I believe she loved him. Her letters are—— Well, I am glad he told me to read them, for they shew she was worthy of him. But how to tell her that he is dead?'

'Yes, to tell her. She has a father?'

'Of course. It was her father who arranged it all. He and old M. Bertrand, Eugène's father, were great friends, and they decided that their children should marry. I suppose they would have been married before now, if it had not been for Eugène's unlucky journey to South America.'

'Why did not you write to them?' Marco managed to ask.

'Because Eugène made me promise to tell the news myself. He thought Mademoiselle Duhamel would bear it better, if she were able to hear all she should wish to ask.'

Both the travellers were silent for a while, and by-and-by the fly began to pass the first cottages of the village near to which Mr Duhamel's house stood. A minute or two more, and it drew up at the door of the village inn.

'Here we are,' said the elder of the travellers with a scrutinising look at their quarters. 'Let us see our rooms, and then get this miserable business over.'

Half an hour later, the two young men walked up to Mr Duhamel's door, and the elder sent in a card with a request for a few minutes' private conversation.

Mr Duhamel had come back from his walk, and was sitting with his daughter and niece when the card was given to him. 'Emile de Bellechasse,' he read aloud. 'Who is he, I wonder? Ah—h—h!' he went on after a moment, looking with excessive slyness at his daughter. 'E. B. We have seen those initials before, I think? There's a "de" here, to be sure. But what did I say? Eh, Claire?' He got up, and went briskly out of the room, leaving the card, on which Claire seized, eagerly reading the name over and over.

'What does it all mean, Claire?' asked Anne from her work-table.

'Papa said Eugène meant to surprise us—and oh, Anne,' Claire cried, breathless, 'if this be him!'

In Mr Duhamel's 'study' an odd meeting was taking place. M. Emile de Bellechasse, sorely troubled by his mission, stood dumb before the beaming looks of his host. He, who was so seldom embarrassed, stammered, and changed colour like a girl.

'Monsieur de Bellechasse?' said Mr Duhamel, with an accent which plainly expressed, 'Call yourself what you will, you are sure of a welcome.'

'Yes,' Emile answered. 'And this, Mr Duhamel, is my friend, Marco Castelli, who, like myself, was a friend of Eugène Bertrand.'

'Any friend of Eugène's is welcome,' answered Mr Duhamel. 'You, I fancy, Monsieur de Bellechasse, are a very intimate friend, though I don't remember to have heard your name from him.'

Emile felt his task grow harder as he looked at the arch face of the old gentleman. He glanced at Marco, but it was evident enough that his comprehension had left the conversation at its very beginning.

'I was his most intimate friend,' he began gravely. 'I bring very sad news, Mr Duhamel.'

'From Brazil?'

'Yes. We landed yesterday. Eugène met with an accident which resulted in his death, just before the time we had all fixed for leaving Brazil together.'

'Dear me! what a sad story!'

'Is he mad?' thought Emile. 'One would say he was rather pleased than otherwise.'—'Sad indeed,' he went on aloud, 'for me, who have lost my best friend, and still more for your daughter, to whom he commissioned me to break the news.'

'He wished you to tell Claire yourself, did he, poor fellow?' asked Claire's father, still with the most imperturbable good-humour.

'He did. But I should be thankful to be spared the task, if you, sir, will undertake it.'

'Not I, indeed, *Monsieur de Bellechasse*. Claire will bear it much better from you. I will fetch her.'

'Good heavens! Marco, what does it mean?' cried the bearer of bad tidings, as they were left alone. But Marco could give no information.

Mr Duhamel, shutting himself into the drawing-room, gave way to the utter aggravation of his daughter—to a fit of the merriest laughter. Claire ran to him, pinched his arm, implored him to tell her what had happened. Anne pushed away her workbox, and looked on in silent wonder. Was it really Eugène?

'O Claire, Claire! what did I tell you?' were the first words they heard. 'You'll break your heart, my child—you'll never get over it!'

'Papa, don't talk in riddles! Tell us, is it Eugène?'

'O no, my dear, only M. Emile de Bellechasse, a *very intimate friend of Eugène*—so intimate, my dear, that they are quite *inseparable*, ha, ha! And if you don't see Eugène to-day, Claire, you will never see him, depend upon that. Come and ask M. Emile if it is not so.'

Claire drew back from her father while he spoke, and clasped her hands together with a pretty gesture, half-doubt, half-joy. She drew one deep breath, then slipped her hand through Mr Duhamel's arm. 'Let us go to him,' she said.

'Take care, then,' her father answered. 'Don't spoil his pretty romance—and yet he *can't* expect us to be taken in by it. He will tell you a terrible story, my dear. It is well to warn you beforehand.'

By this time they had reached the study door. Mr Duhamel opened it, and led Claire, trembling now, and changing from white to red, straight up to Emile.

'Monsieur,' he said, 'let me present to you the fiancée of *your friend*, Eugène Bertrand.'

Claire, hardly knowing what to do, put out

her hand, and Emile took it. Neither of them found anything to say, for *her* heart was beating with stifling quickness, and *his* ideas were all thrown into confusion by the sudden vision of loveliness that flashed upon him.

'Mademoiselle,' he stammered, after a moment, 'it is a cruel fate which sends me to you.'

'I can hardly think so, monsieur,' she answered, trying not to smile, 'or why yield to it?'

'You do not guess, then, what my business is?'

'How can I? Except that you come to see us.'

'What shall I say?' Emile questioned himself. 'How can I tell her?' and then his puzzled glance fell on the face of Mr Duhamel, who stood, beaming with smiles, a little way off. 'Mr Duhamel, I have a packet of letters to deliver to your daughter; will you give them to her for me?' he said in despair, drawing a small parcel from his pocket.

'Letters?' Claire repeated, and for a moment her face darkened, but a look from her father reassured her. 'Whose letters, monsieur?' she said.

'Your own, addressed to my poor friend, Eugène Bertrand, and intrusted to me by him,' he replied, giving her the packet.

'A great trust,' she answered, half-smiling, as she took them. 'And my likeness?'

'Is here,' he replied, as he put into her hand a pocket like the one she herself wore.

She held the things all together in her hand for a moment, and then laid them on the table close to him. 'Why did Eugène bid you bring me these?' she asked.

'I was his dearest friend. I knew all the story of your engagement—and I was with him when he died.'

Claire's cheek turned white for a moment. Again she looked at her father, who nodded approval and comprehension.

'Since you are so deep in Eugène's confidence, archly pursued Claire, 'you may keep those things, monsieur; I do not reclaim them.'

'I, mademoiselle?'

'Yes; at least, if you will tell me one thing.'

'Whatever you will,' he answered, giving up the problem as unsolvable.

'Did Eugène really care for me?' Claire asked very gravely, but with rose-red cheeks.

'Far more, mademoiselle, than I should have thought it possible to do for a lady one had never seen.'

'And do you think that seeing me would change him?'

'Mademoiselle, if he could have been more utterly devoted to you than he was, he must have been so from the day of your meeting.'

A suppressed sound of applause from Mr Duhamel greeted this speech, spoken with a quite involuntary amount of fervour. Claire's eyes shone like stars; nothing less like a widowed bride could possibly have been imagined. Emile felt his senses deserting him, and stood dumb.

'Well, gentlemen,' said Mr Duhamel, 'you are very welcome to England, and to my house, as I have told you already, and I hope you have made arrangements to stay with us some days at least.'

'We have taken rooms in the village,' Emile answered; 'we did not, certainly, expect so cheerful a welcome.'

'Ah, I daresay not—I daresay not. Well, give up your rooms, and come here.'

'No,' said Emile to himself; 'that will never do.

The whole family must be mad. And besides, in an hour's time, I should find myself making love to Mademoiselle Claire, who seems nowise unwilling. No; I must get away at once.'

But this was not so easy. Matters ended in a compromise. The two friends would go back to their inn, where they were expected, but they would dine with the Duhamels, and perhaps to-morrow change their lodgings. Mr Duhamel, chuckling, accompanied them to the door.

'Eugène I mean *Monsieur de Bellechasse*,' said he (and Emile thought he had never heard his own name pronounced with so much emphasis), 'you are a very clever young man, and a capital actor. But you should have been warned that some people can see a little further through a stone wall than their neighbours. It is not such an easy thing to make *me* shut my eyes. *Au revoir*, seven o'clock precisely.' Still laughing at the stratagem of his intended son-in-law, Mr Duhamel followed Claire back to the room, where Anne Burton had waited impatiently for some account of the new-comers.

'And you are satisfied?' were the words Anne was saying as he came in.

'Ay, my child, tell us now, are you satisfied? Has your old father chosen well for you?'

For all her answer, Claire threw her arms round his neck, and hugged him heartily.

'Is he like his picture?' Anne asked again.

'Not very,' Claire answered. 'But I always was certain he must be ever so much nicer than *that*. Oh, he is delightful, Anne. I know now *exactly* what I wanted him to be like, and I never was quite sure before.'

'Happy girl!' laughed her cousin. 'I hope he is equally pleased.'

'I do think he is—at least he looked like it. —Didn't he, papa? But I think he was a little put out because we seemed to guess his trick.'

'He'll forgive us,' said Mr Duhamel. 'But we shall see if he keeps up his character this evening. They are coming to dinner, Anne, so then you'll see them.'

'Oh, what shall I wear?' cried Claire, as she ran up-stairs to her room, whence, through the open windows, she could be heard singing from one of her favourite French poets:

Si vous n'avez rien à me dire,
Pourquoi venir auprès de moi?

THE MOABITE STONE.

SOME time ago, in an article on Explorations in Moab, suggested by the deeply interesting work of Dr Tristram, we had occasion to allude to the famous Moabite Stone, discovered by Dr Klein in 1868. What we said on that occasion may possibly have whetted a desire to know more about this ancient monument. If such be the case, we purpose, from the best sources, to offer some information on the subject.

We begin by leading the mind to the land of Moab, which lies on the east side of the Dead Sea, and is now, with its ruined grandeur, in the hands of barbarous Arabs, tributary to that unimprovable of all people, the Turks. The Moabite Stone, as it has been called, is nearly three thousand years old, and was erected by Mesha, king of Moab, in the year 890 B.C., as a commemorative

offering to his god Chemosh, for delivering him from the hands of his oppressors. After numberless defeats, King Mesha finally succeeded in shaking off the yoke of the oppressors, and recorded his victories in the Phœnician language on this very stone, which he set up at a place called Dibon (now written Diban), to the east of the Dead Sea, where it was discovered in 1868, by a Prussian missionary, the Rev. Augustus Klein, under circumstances we shall presently narrate.

In the meantime it is necessary to go back and tell the story of the stone, what led to its erection, and the great historical interest attaching to it, which brings us face to face with those far-off days when Elisha befriended the widow, and Naaman the leper was healed; for we read in the book of Kings how 'Mesha [the same who erected this stone] king of Moab was a sheep-master, and rendered unto the king of Israel an hundred thousand lambs, and an hundred thousand rams, with the wool.' A very heavy tribute this to pay, considering the smallness of the kingdom of Moab, which was in reality no larger than a good-sized English county.

Again we learn--from the Bible--that after Ahab's death the Moabites called the neighbouring tribes of Ammon and Edom to their aid against the oppressors; but the allied armies quarrelling among themselves, were defeated, and became the spoil of the conquerors. But the Moabites, or rather King Mesha was not one to accept defeat; and we next hear of him through Jehoram, who calls upon Jehoshaphat to help him, saying: 'The king of Moab hath rebelled against me: wilt thou go with me against Moab?' And he said: 'I will go up: I am as thou art, my people as thy people, and my horses as thy horses.' (2 Kings, iii. 7.)

The armies of Israel and Judah then united against King Mesha, whom they regarded as so formidable an enemy and dauntless that they even strengthened their forces by an alliance with the king of Edom. And now comes the connection between the Bible narrative and the inscription on the stone that is so full of interest. The three kings, it seems, instead of taking the direct route into Moab by the north of the Dead Sea, made a circuitous route to the south through the wilderness of Edom, where the lack of water and other privations made them despair of ever reaching Moab, had not Elisha worked a miracle in their favour, and supplied them with water. We are not told in the Bible why they took this longer route, with the certainty of danger attending it; not until the stone was discovered do we learn from the inscription that they were forced to do so, as King Mesha had possessed himself of, and fortified all the towns along the northern frontier.

But all King Mesha's efforts proved unavailing to withstand defeat. He was overpowered by the kings, and in his despair and desperation he strove to appease the wrath of his god Chemosh, who--the stone declares--was angry with his land. Mesha, therefore, brought to bay at last, on seeing the destruction which war had made upon his country, how 'the Israelites rose up and smote the Moabites, so that they fled before them . . . and beat down the cities . . . stopped all the wells of water, and felled all the good trees . . . then he took his eldest son that should have reigned in his stead, and offered him for a burnt-offering upon the wall. And there was great indignation against Israel,

and they departed from him, and returned to their own land.'--(2 Kings, iii. 24-27.)

The Bible narrative throws no further light upon the fate of Mesha. It is on the stone we find the sequel, which, after reading, we cannot help fancying is hinted at in the closing verse given above: 'And they departed from him, and returned to their own land,' owing, as we believe, to the 'indignation' of the Moabites against Israel, which, according to the sequel, must have manifested itself in the indomitable courage of Mesha, who, if his account of his victories be true, which some seem to question, like a true warrior, refused to be beaten, and determined to fight or die in delivering his country from the oppressor. How he accomplished this we learn from the stone, which has been translated into English by Dr Ginsburg as follows: 'I, Mesha, am son of Chemoshgail, king of Moab, the Dibonite. My father reigned over Moab thirty years, and I reigned after my father. And I erected this stone to Chemosh at Korchah (*a stone of salvation*) for he saved me from all despoilers, and let me see my desire upon my enemies. Now Om(r)i king of Israel, he oppressed Moab many days, for Chemosh was angry with his l(eg)nd. His son succeeded him, and he also said, I will oppress Moab. In my days he said, (*Let us go*) and I will see my desire on him and his house; and Israel said, I shall destroy it for ever. Now Omri took the land MEDERA, and (*the enemy*) occupied it (*in his days and in*) the days of his son forty years. And Chemosh (*had mercy*) on it in my days; and I built Baal Meon, and made therein the ditch, and I (*built*) Kirjathaim. For the men of Gad dwelled in the land (*Ataroth* from of old, and the k(ing of Israel fortified A)taroth, and I assaulted the wall and captured it, and killed all the wa(r)riors of the wall, for the well-pleasing of Chemosh and Moab; and I removed from it all the spoil and (*offered*) it before Chemosh in Kirjath; and I placed therein the men of Siran and the m(en of) Mochrath. And Chemosh said to me, Go, take Nebo against Israel. (*And I*) went in the night, and I fought against it from the break of dawn till noon, and I took it, and slew in all seven thousand (*men, but I did not kill*) the women (*and maidens*, for (*I*) devoted (*them*) to Ashtar-Chemosh; and I took from it (*the ves*)sels of Jehovah, and offered them before Chemosh. And the king of Israel fortif(ied) Jahaz, and occupied it, when he made war against me; and Chemosh drove him out before (*me, and*) I took from Moab two hundred men, and all its poor, and placed them in Jahaz, and took it, to annex it to Dibon. I built Korchah, the wall of the forest, and the wall of the city, and I built the gates thereof, and I built the towers thereof, and I built the palace, and I made the prisons for the crim(inal)s with(in the) wall. And there was no cistern in the wall in Korchah, and I said to all the people, Make for yourselves every man a cistern in his house. And I dug the ditch for Korchah with the (*chosen*) men of (I)sræel. I built Arcer, and I made the road across the Arnon; I built Beth-Banath, for it was destroyed; I built Bezer, for it was cu(t down) by the armed m(en) of Dibon, for all Dibon was now loyal; and I reign(ed) from Bikran, which I added to my land, and I bui(lt) (*Beth-Gamul*) and Beth-Diblatthaim and Beth-Baal Meon, and I placed there the p(oor people of) the land. And as to Horonaim (*the men*

of Edom) dwelt therein (on the descent from of old). And Chemosh said to me, Go down, make war against Horonaim, and take it. And I assailed it. And I took it, for Chemosh restored it (t) in my days. Wherefore I ma(de) . . . year . . . and . . . I . . .

The subsequent story of the stone will account for the italicised letters; but it is curious to note, before passing on, that all the towns mentioned in the inscription are spoken of by Jeremiah, warranting the conclusion that the stone was well known and a source of offence to many of the prophets, who threaten Moab with destruction because 'he magnified himself against Jehovah.' What we have narrated is its history as it stood until the year 1868, unknown to any, save the Arabs of the neighbourhood of Dibân, who were ignorant of the characters of the inscription, and simply regarded it with superstitious reverence as the protector of their crops. For nearly three thousand years it had stood hidden from the observation of the traveller, until a German missionary, the Rev. Augustus Klein, arrived one day at Dibân on his way to Kerak. He was received with friendliness, he tells us, by a sheik of the tribe Ben Hamide, encamped at Dibân, who entertained him with all the ceremonial of Bedouin etiquette. He was accompanied by, and owed his welcome to his friend Zattam, son of a famous sheik. Zattam, who was all anxiety to make the missionary's journey safe and agreeable, informed Mr Klein, while drinking coffee in the tent of the sheik of the Ben Hamide, that there was an interesting stone among the ruins of Dibân with an ancient inscription, which no one had ever been able to decipher, and volunteered to shew it to him. As the sun was nearly setting, the missionary was all impatience to start at once to visit it, especially as the sheik of the Ben Hamide said it was one of the wonders of the region, which no Frank had yet seen. Zattam, however, was not disposed to go at once, so the sheik volunteered to conduct him to the spot without delay, as a mark of honour both to his friend Zattam and to the missionary, who was travelling under Zattam's protection. They went accordingly, as the offer was gladly accepted by Mr Klein, who was not only the first, but destined also to be the last European who should ever see this Hebrew monument in perfect condition.

And now we will quote the result of his visit in his own words, written in a letter to the *Pall Mall Gazette*, 20th April 1870. 'When I came to the spot where this precious relic of antiquity was lying on the ground, I was delighted at the sight, at the same time greatly vexed that I did not come earlier, in order to have an opportunity of copying at least a good part of the inscription.' He copied, however, a few words from several lines at random, with a view to ascertaining the language of the inscription, on his return to Jerusalem; or to 'prevail on some friends of science to obtain either a complete copy of the inscription, or the monument itself,' which he describes as lying among the ruins of Dibân, perfectly free and exposed to view, the inscription uppermost. He got four men to turn it round (it was a basaltic stone, exceedingly heavy), in order to ascertain if any inscription were on the other side; but there was not. It was rounded at both ends, and had thirty-four lines of inscription, each about an inch and a half apart; those at

the top and bottom of the stone being somewhat shorter than the rest, on account of the narrow breadth in those parts. It was about three and a half feet high, and about two in breadth and thickness, and in a state of perfect preservation, not a single piece being broken off. But according to the *Athenæum*, the stone has been found, since its restoration, to measure 'four feet one inch by two feet one and a half inches, and the inscribed portion is surrounded by a raised border of two inches in width.' It is, moreover, square at the lower end, and not oblong, as Mr Klein supposed. From great age and exposure, some of the letters had been worn away until they were scarcely legible; but before he left, Mr Klein was able to make not only a correct sketch of the stone, but to collect a perfect alphabet from the inscription.

About this alphabet we must say a word. The origin of language, and how mankind succeeded in representing their ideas to the sight as well as to the ear, has always been a subject of the deepest interest; and here, in this stone, we are made acquainted with a fact, sometimes disputed, that an alphabet capable of forming consecutive words existed three thousand years ago. The characters are Phœnician, and the Phœnicians are supposed to have been the first originators of the alphabet, every letter of which was formed to represent some familiar object, from which it took its shape and sound. As the progenitors of mankind were pastoral in their habits, they went to nature for their characters, and every letter represents, curiously, both in form and meaning, some attribute of their pastoral life. Thus, *Aleph* (A) means ox, and the character rudely drawn is intended to represent the head of the animal. *Beth* (B), a house, looks like a tent; while *Gimel* (C) is a camel, and is drawn to represent the head and long neck of the animal. It is in these Phœnician characters that the inscription on the Moabite stone is written, and they are identical with the ancient Hebrew characters.

But to return now to Mr Klein and his adventures—or rather the adventures of the stone as soon as Mr Klein had found it. On reaching Jerusalem, he shewed his sketches to the Prussian consul, who at once perceived the value of the discovery when he saw the Phœnician characters of the inscription. He lost no time in writing home to the directors of the Royal Museum of Berlin, who telegraphed in reply that he was free to purchase it.

Mr Barclay of the Jewish Missionary Society, and Captain Warren of the Engineers, in command of the Palestine Exploration party, came to hear of the stone also; but on learning that the Prussian consul was in treaty for the purchase, they determined not to display any eagerness in the matter, knowing that if they did, the Arabs would become alive to the value of the stone, and charge accordingly. In the meantime, Mr Klein despatched a trusty messenger to the most powerful sheik at Dibân, praying for his aid to procure him the stone; but the sheik was not to be relied on, and failed to help in any way. A second messenger was then sent to another powerful Bedouin, asking him to negotiate with the Arabs for the purchase of the stone, offering him the sum of one hundred napoleons, half of which should be paid him before starting, if he would bring the stone in safety to Jerusalem. But this messenger was not any more

successful than the last, and came back with the news that the Arabs had hidden the stone. The fact is, the moment they heard that a price was likely to be offered for it, they regarded it as the Italian brigand does his captive—it was to be heavily ransomed, or destroyed! The price they put upon the stone was something enormous—equalling a thousand pounds of our money, because they pretended that if they sold it, misfortunes would overtake their crops; so they were determined to realise a handsome sum as a set-off against any number of bad harvests.

The Prussian consul of course would not pay them that sum; and the help of Turkey was asked in the matter, the Grand Vizier writing to the Pacha of Jerusalem to let the Prussian consul have the stone for the money he saw fit to give. But the pacha turned out another failure. Truly it was a precious stone, and difficult to be got at. Eight months had passed since Mr Klein had first discovered it, and still they were no nearer to possessing the stone. About eight months after that again, the sheik to whom the hundred napoleons had been offered in the first instance, came to the consulate with the news that the Sheik of the Ben Hamle, whom we have before met as the one who first shewed the stone to Mr Klein, would let him have the stone for one hundred and twenty napoleons. The money was paid at once, and the sheik returned to get the stone from the Arabs who had concealed it; but when the moment came for signing the contract and taking possession—lo and behold, they began to grow jealous and quarrel among themselves about it, until finally they refused to let it be carried away!

But now counter-influences which were at work around the stone, caused its destruction. M. Ganneau of the French consulate, hearing nothing further of the Prussian negotiations, entered the field on behalf of the French government as a purchaser, offering nearly treble what the German consul had offered, and sending a messenger to take a 'squeeze' (an impression) of the stone. It was while this messenger, an Arab, was taking the impressions with damp paper, that several parties of Arabs assembled around the stone, each advancing their separate claims for a share, and squabbling loudly for their dues. They became so excited at last over the dispute, that M. Ganneau's messenger chose the better part of valour and fled, but with his impressions of the stone nearly torn to pieces in the encounter, and a sword-thrust in his back as a parting token of remembrance. He appeared before his master in a sorry plight, handing him only a bundle of crushed papers as the result of his enterprise. But crushed as they were, M. Ganneau succeeded in deciphering them; and they were subsequently of the greatest use when the fragments of the stone came to be put together. To make a long story short, the Bedouins finally received orders from the Wali of Damascus to deliver up the stone; but rather than do this, as they had a personal spite against him, they determined to break it in pieces, which they did, distributing them among the chief families of the districts, who guarded the fragments as a charm against bad harvests.

And now that the poor stone was scattered, who would ever think of its coming together again! The energy and perseverance of Captain Warren and M. Ganneau effected the marvel. They at

once, on hearing of its destruction, had agents everywhere to secure the missing pieces; success has crowned their efforts, so much so that the *Athenæum* states, that 'the stone has been restored by means of two large fragments purchased by M. Ganneau, the small fragments obtained by Captain Warren, and given by the Committee of the Palestine Fund to the Louvre.' A fac-simile cast of the stone, as now restored, has been presented to the Committee of the Palestine Exploration Fund. Thus will the stone of King Mesha, the indomitable, find an honourable asylum in the Louvre, to testify of its preservers, no less than King Mesha, that they were men who refused to be beaten, and defied destruction.

CORNISH SARDINES.

'Are pilchards sardines?' is a question which we are told has now been answered, by scientific investigation, in the affirmative. But there is another method of determining the point, more homely, but not less accurate than that of comparing anatomic structure, in the application of an old proverb, 'The proof of the pudding is in the eating'; and the identity of pilchard and sardine may be proved in that way too. In an article in October 1875 we mentioned that a Company had been formed at Falmouth, under the name of the 'Cornish Sardine Company, Limited,' for the purpose of preserving pilchards in oil, after the same process as that adopted with the French sardines. This Company seems to be thriving. The fish are selected according to size, the smaller ones being put into tins holding eighteen ounces, and labelled 'Cornish Sardines'; while the larger ones are called 'Pilchards in Oil,' and packed in tins of twenty-two ounces. The result is a delicacy which we are told cannot be distinguished from the 'sardines' imported from France, thus practically proving the identity of the two differently named fish.

The importance of this industry in a commercial sense is likely to be enormous. Pilchards are found in vast numbers every year off the coast of Cornwall; but beyond a quantity annually sent to Italy, after being salted and pressed, and rendered unpalatable to all but fasting penitents in the season of Lent, and a small proportion preserved in vinegar by the Cornish villagers for use during the winter months, very few of these naturally delicious fish have been added to the food-supplies of the world. Large numbers are used for manure; and others are pressed for the sake of the oil they produce; but otherwise they have been little esteemed. The fish deteriorate so quickly after capture, that they cannot be sold fresh even in English markets; but the method of preserving them in tins adopted by the above Company enables them to be now brought within the reach of all. With the present high prices of meat and fish, such a means of adding to our food-supplies ought to be welcomed; and as a British production, the 'Cornish Sardines' and 'Pilchards in Oil' will sooner or later occupy a high place in the estimation of the British public. At any rate the pilchard is at last in a fair way of overcoming the prejudice against it which has hitherto unfortunately existed.

THE CROWN OF LIFE

THERE is very little unanimity of opinion anywhere, and 'so many men, so many minds,' is a time-honoured saw which incloses more truth than always belongs to these concrete crystals of thought called proverbs. But about nothing is there less unanimity than about the highest meaning of life, and what is the best thing to strive for, the sweetest thing to cherish. With some it is love; with others it is success; with a few it is religion; and with even fewer still it is abstract duty—duty irrespective of personal reward here or hereafter; duty apart from the praise of men, and without the hope of gain; duty because of the sacred obligations lying in itself alone; duty because it is duty!

It is a favourite saying with the emotional and feeble-minded that duty is cold, and that love alone gives warmth and life to action; that doing one's duty, however thoroughly, carries no sense of healing with it, leaves behind it no sense of blessing. In which is the same kind of mistake as has been so often made between justice and legality; for the duty which these objectors mean is merely the mechanical performance of so much practical obligation, and the duty which we mean, and which alone is worthy of discussion, is that which involves the sacrifice of self for the sake of conscience, the love of the soul for virtue rather than the love of the heart for love.

There are people who make the very name of doing one's duty odious, because it is all a lifeless mockery of the real thing, without truth and without meaning. The cold unloving woman who fulfils to the letter every required condition of her marriage-tie; who keeps her husband's house in respectability and outside comfort—but as his house rather than her own, or maybe as hers rather than his, anyway not as a joint home, where both have rights, and both find joy; who balances her books with accuracy, and does not fill his rooms with undesirable guests; who takes sufficient care of his money and his comforts alike, and neither sends him in milliner's bills which he cannot pay,

nor puts before him a dinner which he cannot eat; who does not defy him when he forbids, nor refuse when he requests; but who contrives, with all this apparent dutifulness, to make his life a burden to him, and his marriage a misfortune—is she one who can be said to lead a life of duty in the higher sense, whatever she may do in the way of fulfilling her obligations with what we may call mechanical correctness? Does the dull automatic performance of a few routine duties (we want two words for the different things included now in one) constitute the grand life known as conscientiousness, self-sacrifice, love of right?—all of which virtues are gathered together in that one word, Duty. Surely not! This is legality in the place of justice, obligations painfully discharged, not duty nobly accepted and loyally performed.

So, the man who 'does his duty by his family'—but the bare bones of his duty only, giving nothing beyond what the law and public opinion force him to give—cannot be said to live for that kind of duty of which God demands the strict fulfilment, if we are to find favour in His eyes. He gives his wife money enough to keep the house, but he gives her nothing of his care, none of his thoughts, his sympathies, his tenderness. Let her be happy or unhappy, it is all one to him. He has done his duty by her in the way of a liberal allowance for housekeeping, and pocket-money for herself; in the way of freedom of action, and that form of indifference called liberty, which does not care even to chide and never to direct; he has done his duty by her, he says; for the rest—who can blame him? He sends his sons to school, and then to college, or puts them into the business that offers itself; but he gives them no advice, never makes himself their friend, and simply feeds and educates them, as the obligation laid on him by society and the law, supplementing nothing of this obligation by grace given voluntarily and striking to the deeper root of things. If he had a true sense of duty, he would know that this was simply keeping the promise to the ear, while denying it to the heart

and to truth ; and that human life demands more than bare bones for its sustenance, however accurately these may be arranged and labelled. Indeed this kind of thing is not duty at all, any more than mechanism is life. But just as the ignorant savage believes that a watch lives, and that the ticking of its wheels is the beating of its heart, so does the untaught conscience accept obligations discharged as duties fulfilled, and make itself happy in the conviction that it is above reproach and beyond the need of amendment.

Nothing strikes one so much in the history of the ancient Greeks and Romans as their glorious sense of duty. The duty of the citizen to his country was the first and holiest law laid on each man's soul. For that country he must be prepared to sacrifice family and goods, and life itself when the need came, without any of that fond looking back by which the resolution of even the heroic is weakened, and the spirit of brave men subdued by their emotions. It was his duty. The world contained nothing greater or more compelling than this word ; and what discipline is to modern life, this was to the ancient—only that, being more individual in its action than discipline, the duty of the ancient hero had a certain largeness and picturesqueness wanting in general to this other. And yet, when we remember the Balaklava charge and the wreck of the *Hirkenhead*, we cannot say that discipline fails in picturesqueness ; or that masses of men, moved to consensaneous action by the law of obedience, are not as glorious as individuals voluntarily sacrificing themselves for the sentiment of duty—that unspoken law which ruled the public life of men as it has never been ruled before or since. Each method has its grandeur, its beauty, and each has its fitting time. To the smaller communities belongs the prominence of individual qualities, individual action ; to the larger, the submission to authority, to law, to organised command. But we can never forget what we owe to the ancients, as we familiarly call them ; nor how the history of humanity has been enriched and ennobled for all time by the pictures left to us of the men who went to destruction for the sake of their country, of the women who devoted themselves to death that by their sacrifice they might appease the anger of the gods and free their land from the curse—all in the name and for the sake of abstract unrewarded and impersonal duty.

So far as this goes indeed, the annals of every race and time and country teem with records of brave men and noble women who have given themselves for their kind, preferring the hard things of duty to the soft ones of selfishness, and loving the right better than pleasure. No passion has roused men to a grander life of heroism, or led them to a nobler death, than the love of country, and its twin-sister, the love of liberty. From Leonidas to Wallace—and both before and after—we see what can be done under the influence of this great love, this duty which is synonymous

with love ; and the sacred fire is not yet burnt out. If need be, and when the need is, the flame shoots up anew ; and even the most miserable war gets itself hallowed by the splendid sacrifices that are made in it, and the magnificent virtues that it brings forth. Dull and dim as the sentiment of public duty becomes in the piping times of peace, when domestic liberties are not threatened, nor the honour of the country assailed, nor its national existence in peril—when a man's highest civic functions are to serve on a jury, attend the vestry meetings, and perhaps be elected guardian of the poor, or one of the School Board—there is no question that, if the scene changed and the country demanded sacrifice, there would be thousands of volunteers for the pathetic honour of martyrdom ; thousands of brave hearts ready to give themselves for the cause, and to do their duty to the death without bewailing or remonstrance.

The race of heroes never dies out, but the dress of heroism changes according to the circumstances of the time. Now it is Leonidas at Thermopylæ, and now it is Galileo in prison ; now the poor Jew in Spain crying out from amidst the flames of the auto da fé, 'The God of Israel, He is the only God ;' now the poor Catholic in England making the sign of the cross and praying to the saints and the Holy Mother when bound to the stake at Smithfield as the best way to cure his errors ; or it is the Covenanters shot down like a malefactor in his house for reading the Bible, which was more to him than life ; or the Socinian tortured and burnt with anathemas as if he were a dog ; or it is Joan of Arc roused from her sleep by a Voice bidding her deliver France ; or a few comparatively obscure men passing years of their lives in prison not so very long ago, that the 'taxes on knowledge' might be done away with, and the press made cheap that the people might learn to be free. Sometimes in one form and sometimes in another, but always present among men is this noble spirit of duty, this glorious acknowledgment of a life higher than the life of self, and greater than the joys of sense. Without it, indeed, we should never have come to where we stand to-day ; and though our plan is infinitely below our ideal, and less than our possibilities, still, seeing that we have gained what good we have by striving after it, mainly actuated by the law of duty, we may take heart for the future and confess our gratitude to the past.

We have nothing better as a rule of action than the law of duty ; but it must be wisely directed and generously planned. We know that this law by itself, without this wisdom, this generosity, can be translated into cruelty and fanaticism of the worst kind—as witness the fearful religious and political persecutions that have taken place, and that still take place, with more or less rancour in the persecutors, and more or less suffering to the persecuted, as the law and public opinion may forbid or allow. But it is not to be supposed that men, as a rule, liked the task of harrying and burning those who differed from them in opinion.

A few unnatural monsters, half-mad and wholly callous, might have felt a fiendish kind of pleasure in witnessing pain and adding torture to torture. We have always had these semi-maniacs, these moral madmen, in the world, and we suppose we always shall; but they are the exceptions, even among the ordainers of cruelties and oppressions. The actuating motive was the sense of duty. It was their duty—so even the inquisitors taught themselves to believe—to stamp out this and that dangerous heresy from the world; and they took the best means known to them. Open and fair controversy, public discussion of differences in views and opinions, was not a method in vogue in those days, and would have been thought high treason to the majesty of truth had it been allowed. 'So many men, so many minds,' was a doctrine of shameful laxity, of consenting with sinners, and by no means to be sanctioned by the guardians of the majesty of truth. Hence the only thing remaining was to kill the bodies of those whose minds were evil, that they should not corrupt the innocent nor mislead the virtuous by their debased thoughts. It was their idea of duty to them, the inquisitors and law-makers; if also duty in their poor victims to still testify, whatever the consequences, and to prefer torture and death to recantation and life. And what we have seen in the world's history we might see again, if the current of conscientiousness set that way, and illiberality to men was again considered the highest expression of fidelity to God.

This narrowness and illiberality, this fanaticism and perfect satisfaction with one's own ideas on things, are just the dangers of very dutiful people. What they think they ought to do, that they do, without the smallest reference to the feelings, the right of free opinion, or the need of free action in others. Those rights indeed, if connected with opinions pronounced to be wrong by the fanatics, are as accursed as was ever Judaism in Spain, Mohammedanism to all Christendom, Protestantism under Mary, and Papistry under Elizabeth. Still the desire to regulate the souls of others according to the laws by which we regulate our own, dominates those of us who are earnest and faithful, lovers of the right and aspirers after good. We cannot concede the liberty of difference of opinion when we believe that we hold the truth, the very truth for what second reading can there be to truth? what difference of opinion on the supremacy of the absolute? We think it our duty to argue and protest; to suppress if we can, to deny always, such things as we hold to be errors. It may be unpleasant to the hearer and an effort to ourselves; but it is our duty, we say, and that word clamps the most shaky will into serviceable stiffness. Thus, we sometimes say that it is our duty to remonstrate with our friends for their shortcomings here and their wrong-doings there—to tell our mind to A. about his habits, how the turf will be his ruin, and cards his destruction; to inform B. that, to our view of things, his business is badly managed, and his family ill-conducted; and so on. 'It is our duty,' we say, and we must neither fear nor avoid the most disagreeable results of this powerful watch-word. But there are limits even to virtues, and the practical exercise of our idea of duty has its boundaries like the rest. It is rarely our duty to be aggressive; and putting all the world to rights may be overdone, however sincere our intention.

These are the slips made by zeal when more warm than wise, the weak points of action in a strong faith. Nevertheless, for all the mistakes that have been made, and are still daily made in the name of duty, it is the noblest thing for which to live; it is the truest compass by which to steer our course; the best guide; the most faithful counsellor; the fairest jewel to be worn on our breast; the golden chain about our feet binding us to good, keeping us back from following evil; the lamp that illumines us in the dark hours of the soul, the distracted moments of the mind's doubt; the throne whereon we rule Ourselves; and the imperishable Crown of Life.

FALLEN FORTUNES.

CHAPTER XXX.—MR HOLT DEPARTS WITH FLYING COLOURS.

HOLT did not know the precise moment at which Mrs Dalton had quitted him; a mist seemed to come over his eyes at her last words, and the next sound he had any clear cognisance of was a subdued clatter of forks and dishes. He was standing with his face to the mantelpiece, on which rested his elbows, and with his back to the table, from which the servants were removing the luncheon things. He knew not how long he had been in his present position, or how he had assumed it. He was perfectly aware, however, of what had happened: that he had proposed for Kate to her mother, and that that lady had referred him to her husband—in other words, had rejected him. He had good reasons of his own for knowing that if Dalton was to be asked the same question the answer would be a very unmistakable 'No.' To be sure there was still Kate herself, to whom he had not been absolutely forbidden to apply; but that was an experiment from which he shrank; a last hope, to which he must be hard driven indeed before he resorted to it; for he felt her answer would be final. The present, as her mother had said, was an inopportune time to speak to her, and, what concerned him more, it was an unfavourable time. 'You have only to wait,' Mrs Campden had said, or as much as said, 'until she begins to feel the discomforts of poverty, and then your chance will be improved.' Indeed, she thought it a certainty. But could he wait? There was the rub. Could he afford to wait? Being now alone, he drew his pocket-book out, and from it a slip concerning some shipping intelligence, on which he pondered with anxious care. 'The quickest ship on the line,' he murmured; 'curse him!' Then he studied the almanac. 'There is not a day to lose; there is not an hour. The pursuit is madness; I will give her up.'

As he said so, the soft crunch of gravel came from the sweep without, and an open carriage drove by the window: the three girls had come home from Sanbeck. He caught a glance of Kate, as she looked up with a cheerful smile towards her mother's room; her sun-bright hair, her pale expressive features, and her gentle reassuring eyes, made up a picture exceedingly beautiful; it passed in a moment, as though an angel had looked out from heaven, and then withdrawn herself into the impenetrable blue. But he knew that it was reality, and that his adored one was at the hall-door, within a few feet of him. He did not stir,

however, but stood as if spell-bound, listening to the ring at the bell, the footman letting down the steps, and all the usual sounds of arrival. These died away, and were presently succeeded by other sounds: a thumping of some object on the encaustic tiles that composed the floor of the hall; a rapid flutter of female garments, and some hurried talk. Then the door opened, and revealed Mr Geoffrey Derwent with a carpet-bag in one hand, and dragging a huge portmanteau with the other; behind him came Kate Dalton, entreating, commanding, cajoling. Her colour, already high, rose at the sight of Holt.

'I did not know you were here, Mr Holt,' said she eagerly; 'but I am glad of it. Do speak to Jeff. Something has happened between him and Mrs Campden—I don't know what—and he is quitting the house in this fashion.'

'I don't want Mr Holt's opinion upon the subject,' said Jeff vehemently; 'nor any man's opinion. I will not stay another night under this roof.'

'But why carry all that luggage about with you, Mr Derwent?' asked Holt, smiling.

'Because I don't wish to be indebted to any one belonging to Mrs Campden for the smallest service. I shall leave them here, behind the door; and go myself to Bleabarrow for the fly, which will take them away.'

'And then?' inquired Mr Holt with an amused air.

'Yes, indeed; that is what I have been telling him, Mr Holt,' broke in Kate earnestly. 'What is he to do in London, without money, without friends? He will starve to death.'

'He will have to apply for outdoor relief, at all events,' said Mr Holt in corroboration.

'What is that to you?—that is my look-out,' answered Jeff, turning fiercely upon the last speaker. 'You heard what that woman said to me at lunch: would you not think it better to starve than to stay here, if she had spoken so to you?'

'I should certainly not have staid here, in that case,' said Mr Holt quietly.

'There, you hear him!' cried Jeff triumphantly; 'even Mr Holt would not have staid.'

'Pray, do not encourage Jeff in his obstinacy,' pleaded Kate, with tear-dimmed eyes. 'You know the world, and should give him better advice.'

'My advice, Miss Dalton, is, that he should go at once,' answered Holt coolly—'and with me. Your mother and I were talking the matter over; and we agreed, if Mr Derwent himself approved of the plan, that I should take him into my office upon trial: after a month or two, he would be able to judge if stockbroking suited him.'

'Oh, Mr Holt, how good of you! Is this really true?' ejaculated Kate.

'I don't understand,' hesitated Jeff; 'of course it is most kind of Mr Holt; but—'

'Well, just run up to Mrs Dalton, my lad; it was she who proposed the matter, and who will be therefore in the best position to explain it to you. I suppose you would have wished her good-bye in any case.'

Jeff coloured and hung his head; his indignation had indeed been such as to induce him to leave Riverside without bidding farewell to anybody. 'Yes, I will do that,' he said, after a little

hesitation, due, doubtless, to the fear of meeting his hostess upon the way—not that he was afraid of her, but of himself.

Thus, by a most unlooked-for accident, Mr Holt found himself alone with Kate. He was by far the more embarrassed of the two, and shewed it by his silence; he that had been so glib in the presence of a third person had now not a word to say for himself. Kate, on the contrary, poured forth sentence after sentence, without much thought of anything except that she must not give her companion the opportunity of saying anything to her save in the way of reply.

It was 'so kind' in him, 'so thoughtful,' and 'so opportune' to think of taking Jeff into his employment; she was sure he would find him 'so intelligent' and 'so nice.'

'To tell you the truth, Miss Dalton,' said Holt frankly, 'I don't much care how the young gentleman suits me, though I shall do my best to make things suit him.'

'That is still more kind of you,' answered she, 'for Jeff has no friends, except Mr Campden and ourselves, who are, alas, powerless to help him.'

'Nay, Miss Dalton, don't say so: you are all-powerful. Your wish, at all events, is my law in this matter—and indeed in all matters, if you would only let me serve you.'

'You are very good, I'm sure.'

He remembered that those were the very words her father had used, and the very tone, when he had declined his assistance.

'I am not at all good, Miss Dalton,' answered he bitterly; 'except in so far as I am devoted to your interests. Should the time come to prove it, pray remember that.'

She had grown suddenly very pale, and was listening eagerly, not to him, but for Jeff's return. As his quick step was heard in the hall, the girl drew a sigh of relief. Holt perceived all this; but still he had spoken to her in a significant, if not a tender fashion, and had not been rebuked. He felt another man, and a far happier one than he had felt an hour ago. A gleam of hope illumined the dark path of his future, though it was very faint—so faint, that he also hailed Jeff's coming. It had at least precluded her from replying to his last speech, as she had replied to the preceding one. He had bidden her remember to apply to him if she needed aid, and she had not refused to do so. Still, 'not to refuse' was far different from 'to accept.'

'Well, Mr Derwent,' said he, assuming a cheerful air, 'was I not right? Does not Mrs Dalton endorse your acceptance of my offer? You must learn to employ these business terms, you know;' and he smiled pleasantly enough.

'I have no choice,' answered the boy naively. Then conscious that the words were ungracious, he added precipitately: 'But if I had, I should always have felt grateful to you, Mr Holt, for a proposal which, though I know it is not made upon my own account, is certainly generous and unselfish; for I am afraid—at first, at all events—that I shall be of very little service to you. And now, please, I would rather be off. I will stay at the *Golden Cross* in London, where I used to put up on my way from school, till you choose to send for me.'

'O Jeff, don't go away like that!' cried Kate imploringly.

'I must, Kitty. Mr Holt himself said I was right to go.'

'Yes; but not this minute, my lad. That will only make a disturbance in the house, and distress others besides your hostess, which I am sure you do not wish to do.—There is the postman's horn. Now, why should I not have a letter of importance that demands my presence in town to-morrow morning? Then you and I can start to-night.'

'I am afraid that would be hurrying you away,' hesitated Kate; 'but still, if you would'—

'You would be better pleased, Miss Dalton,' interrupted Holt with a touch of bitterness: 'that settles the matter. We must be off by the 6.30 train, my lad; so I will go and put my traps together.'

He did not wait for thanks from either of them, but repaired at once to his own room. He ran upstairs three steps at a time, for he felt like a young man. By a great piece of good fortune he had contrived to lay Kate Dalton under an obligation, and had made his first step with her in the way of friendship, familiarity, confidence. As to the *per contra* side of the account, his engagement of Geoffrey Derwent, it weighed but as a feather's weight in the balance. Indeed, he was by no means certain that it might not be placed in the same scale. If he found Derwent able to do his routine work, it might even be a good stroke of business. Of course, he would take care to treat the lad well and handsomely; but indeed he intended to make him something else than a mere clerk. He had long been of opinion that his 'manager,' Brand, was too clever by half, and had resolved to take the first opportunity of parting company with him. The same objection, he reflected with a contemptuous smile, would certainly not apply to Jeff.

There was not one member of the party at Riverside who was not grateful to Mr Holt that evening. By persuading Geoffrey Derwent to avoid a public scandal—which his slight, as originally intended, would certainly have caused—he had done good service to Mrs Campden, of whom the lad was now persuaded to take leave, though in a very stiff and formal manner. The Daltons were sincerely obliged to him, on Jeff's account; and 'Uncle George,' whose conscience reproached him for his pusillanimity in that matter, still more so. Moreover, as a host relieved of an incubus, Mr Campden blessed his guest for taking himself off.

His departure did not long precede that of those to whom he was originally indebted for his invitation, though for the future he had the assurance of its coming—and that soon—from the fountain-head, namely, the hostess herself. On the third day afterwards, the Daltons took up their residence at the Nook in Sanbeck. Before they left, Mrs Dalton received a farewell letter from her husband, written from on board the *Flamborough Head*. Knowing what we do of him, we can pretty well imagine its contents; but amid all the love and pathos of his parting words—he made no mention of his remorse, since he knew it would distress her—there was a sentence or two of genuine rebuke.

'When I asked to be shewn my berth—which, as I had been informed, I was to share with "a commercial gentleman," bound for Rio—to my

great surprise I was introduced to a first-class cabin. Some one had called, they told me, at the London office and paid the difference for the exchange. Of course I know who sent him, and why you were so particular to ask me about the agent's address. My darling, to think that you should have robbed yourself just now to supply me with a mere luxury, goes to my heart. How could you, *could* you do it?'

Yet what he deemed—and justly—to be self-sacrifice, was in one respect an act of selfishness. Nothing the money—or ten times the sum—could have brought her, would have given Mrs Dalton half the satisfaction she derived from this reflection, that so far at least as his physical needs were concerned, 'dearest John' would be made comfortable upon his voyage. She was herself bound upon a longer journey far than his (as she was well convinced), and one with more uncertain issues; but her chief thought and care were still, as they had ever been, for him.

CHAPTER XXXI.—REALITIES.

It is not to be supposed that the Daltons, being so well liked a family as they were, were neglected by their friends because misfortune had befallen them. Human nature is not quite so base as some philosophers would have us believe, though there are a great many selfish persons in the world, and especially (I am afraid I must say) in good society. John Dalton had been right in his idea that he was rather an obstacle to the good-will of others towards his belongings, and that if he were dead they would find many offers of assistance that were almost of necessity withheld while he was alive. Even his departure for Brazil brought some of these into blossom—nay, into solid fruit, if only Mrs Dalton had cared to pluck it. One good lady would even have taken Kate off her hands—she had been always 'so fond' of Kate—for good and all; though it must be owned that her proposition was a little vague. Another would have been glad to offer Mrs Dalton and both daughters a home, 'while they looked about them for a suitable residence.' Condolences and sympathetic inquiries had long been rained in showers upon this unfortunate lady; so that not the most cynical could have described her as forgotten. But the fact is, admitting that there is any number of mean and miserly people in the world, who will weep for their friends in need, pray for them, sympathise with them, and, in brief, go to any length short of assisting them, it is also difficult—it must be confessed—to afford assistance such as would be acceptable. I would on no account be supposed to have any of that 'enthusiasm of humanity' which the critics agree is a sign of the feeblest intelligence; I know how easy it is for folks to condole with their friends upon the loss of their relatives, and how difficult, because dangerous and compromising, they find it to do so on the loss of their goods; but it must be acknowledged withal that, hard as we may find it in this world to help ourselves, it is even harder to help others who are helpless. People are not more malleable, do not fit into any shaped groove that may be offered to them, the more easily because they have become poor. Mrs Dalton had two fixed ideas, in adhering to which she was resolute, and which, without doubt, rendered their case very

impracticable—namely, (1) that she would not be separated from her girls; and (2) that they should have a home of their own, however humble. Sorrow, she knew, is doubly grievous when it has to be borne with a forced smile, as it needs must be when we are guests in the house of a friend. Otherwise, when Lady Skipton wrote to invite Kate, Mrs Campden was strenuous in urging that her offer should be accepted: 'It would give the poor girl a chance once more, in the way of suitors; and perhaps she added also to herself, 'and how convenient it would be for Mr Holt in particular, to prosecute his attentions.'

These kindnesses, these offers, these well-meant attentions of all sorts, were, however, all laid before her daughters by Mrs Dalton, not so much that each should have a voice in their acceptance or rejection—for she well knew what their replies would be beforehand—as that they should understand their own position with respect to others. Even when these communications were unpleasant, as they sometimes were, she did not withhold them from their eyes. It was well that they should look the world in the face, since the time was coming when there would be none to disguise from them its stern realities—when the hand should be powerless that had secretly warded off from them its sharpest buffets, and the voice that had interpreted its tones so tenderly for their sakes should be stilled for ever.

One little indulgence Mrs Dalton did permit herself—she resolved that Tony should not be sent to school for another half-year: he was still young for Eton: his education under Jenny's auspices was going on quite satisfactorily; he was a diligent little fellow, and did not require to be nailed to his work, &c. All which excellent reasons were contained in one still greater, though she never owned it to herself: 'I cannot spare the boy; let us all be together for a while, and while we may.'

Instead of saying, 'This is weakness, Edith,' as might have been expected from so uncompromising and well-principled a person as Mrs Campden, that lady fully approved of this arrangement; and would not, perhaps, have murmured if it had been decided not to send the boy to school at all. As for Tony himself, the prospect of the new life at Sanbeck almost made up for the postponement of his Eton joys.

CHAPTER XXXII.—LADY SKIPTON'S CHARITY.

Mr Campden was sorry to lose his guests, yet not altogether so, so far as he himself was concerned; they had already begun to be the cause of quarrel between himself and his wife. He was inclined to be kinder to them in his manner, because of their misfortunes; and this his Julia stigmatised as 'weakness,' and even as cruelty to those he pitied: they would only miss everything afterwards the more, she said, from the sense of contrast; and she took care not to err in this way herself.

When the little family were all in the Riverside barouche together on their way to their new home, Tony put this question to his mamma, preceded, after the fashion of his age, by an affirmation: 'I am precious glad we are going to Sanbeck. What has made Mrs Campden so cross with us all since papa went away?'

Kate and Jenny exchanged a rapid glance.

'Even Tony has remarked it, you see,' said the latter in French. She had spoken of the matter to her sister with vehement indignation, which Kate had endeavoured to mitigate; like her mother, she always strove to find excuses for people.

'Cross, Tony?' answered Mrs Dalton quietly. 'I am sure I didn't know she had been cross. Perhaps you were troublesome.' She thought it best to ignore the general charge of crossness altogether.

'O no; I wasn't, mamma. Only she used to call me "her sweet boy," and now she says "You little nuisance."'

Nobody answered this observation, since it was impossible to refute it. Only Jenny laughed—a little bitter laugh. She had coldly touched her hostess's lips without a word, after her mother and sister had expressed their thanks for Mrs Campden's hospitality, though she had kissed Mary tenderly, and thrown her slender arms about Uncle George, and bidden him quite an extravagant adieu.

'I wish Jenny was not quite so "thorough,"' Kate had sighed to herself; 'though one loves her all the better for it.'

Mrs Dalton, too, had dropped a tear in secret over that independent spirit of her second daughter, which under present circumstances could not but be detrimental to the poor girl.

But Jenny neither sighed nor wept. She had an honest contempt for all scoundrels, as her favourite Carlyle would have expressed it, and in her indignation against them, was apt, like himself, to spare neither sex nor age, nor even social position in the county.

'That woman is a mean wretch,' was her private comment upon Tony's bill of indictment against his hostess.

The people in Bleabarrow acknowledged their presence civilly as they passed through the little town: the young with pulls at their forelocks, or rapid courtesies; the elders, with grave obeisances, as they stood at their shop-doors.

'They little think we have only one hundred and fifty pounds a year,' thought Jenny. This was a mistake of hers, for the bows were given to them as occupants of the carriage. To the British provincial eye, a fine equipage is little inferior in dignity to the Ark among the Hebrews. Indeed, even in the metropolis, it must have something sacred, or at least curiously significant, as it is often sent empty to 'represent' Royalty itself at the obsequies of our great men.

In Sanbeck, as usual, the barouche created a still greater sensation. It was followed upon this occasion by a *fourgon* containing the luggage. When they had deposited their burden and driven away, 'There go our last pomps and vanities,' said Jenny philosophically. 'Now for the crust and the cross.'

It was a relief to all of them to find themselves under their own roof. Even Lucy—about whom they had naturally some misgivings—expressed herself as agreeably disappointed, and pronounced the clipped yews upon the little terrace, which represented winged dragons, 'heavenly.' She shewed much affability to Margate, as the late Jonathan Landell's housekeeper was called (but probably not after the fashionable watering-place), and spoke of her eulogistically as 'quite a character.' She was, in fact, a great curiosity, being an honest, simple, old

woman, who had done her duty in the world for sixty years, to the best of her ability; if she had ever possessed the vanity of her sex, it had long departed; but she did think that there was no one in Derbyshire who could in its season make a better black pudding than herself; and she had just cause for her confidence. The only trial she ever caused her 'young ladies' was when she would proudly set this delicacy before them as 'a surprise,' as the cookery-books say, and then wait to see them eat it. Tony was the only one who appreciated it, and yet they could not have wounded old Margate's pride for worlds, by leaving it on their plates. Black puddings added another terror to winter at Sanbeck, for they came in with the cold, as fruit does with the warm, weather. Margate's familiar and assistant, Nancy, was a stout village lass, the very incarnation of good-nature, but with no particular beauty to boast of, save the unusual one (for persons in her position) of a set of dazzlingly white teeth; a very fortunate circumstance, since it was her custom to keep her mouth wide open.

'I do think, Kitty, we shall be happy here,' was the verdict passed by Jenny upon the Nook and its belongings, on the night of their arrival.

'If only it suits dear mamma,' faltered Kitty.

Jenny had equally thought of that, we may be sure; and both were well aware that it was not a question of 'smiting;' Mrs Dalton would have been content with far inferior lodgment and ruder fare. But there was something underneath the cheerfulness of her face, and which belied it, that both her daughters read. She had exhibited no curiosity about the house, though she had striven to appear interested in what they told her of it; her only solicitude had been expressed concerning the post—as to what time the letters arrived in Sanbeck.

It was very improbable, indeed, that any communication should be received from her husband for some time to come; yet every morning, when the horn was heard—it was near noonday generally—her eyes would light up with expectancy, and her pale face flush, till the postman had passed the house. Jenny, too, had her anxieties, it seemed, in this respect, for on the third day after their arrival she walked out alone to meet the postman. There was only one letter for the Nook, and that was for her; it was evidently the one she had expected, and she took it eagerly from the man's hand. It was an answer to one she had written to Lady Skipton, after much consideration. Folks had often praised her lace-work, telling her that nothing equal to it was to be got at the shops; that it was worth six guineas a yard at the very least; &c. &c. So she had resolved to utilise her gift of lace-making, for the benefit of her belongings. Under other circumstances, she would have applied to Mrs Camplen to effect this; but she felt too angry with that lady to ask any favour of her, however small. So she had written to Lady Skipton, an old friend of her mother's, and who had always been kindly disposed towards herself, inclosing a yard of her lace, as a specimen, and begging her to find out at what price such work could really be disposed of. If the reply was satisfactory, and such as she had always been led to expect, so far from being a burden to her family in their altered position, she could easily double their present income. Instead of returning home,

where she would be subject to interrogatories, she entered a labourer's cottage, where the auld wife placed a chair for her by the fire, to read the letter. The poor girl would have much preferred to do so in the open air; but the unusual exertion of walking a few yards alone had already fatigued her, and her white face had appealed to the old dame's hospitality. 'Now read your note, young leddie, and dinna mind me,' said she, and then had busied herself about her household work as usual. The contents of the envelope felt thicker than ordinary, and when Jenny opened it, and found a five-pound note within the folds of the letter, she gave a little cry of joy. It was doubtless the price of the yard of lace which Lady Skipton had sold for her in Regent Street or Bond Street, and perhaps she had sent orders for ever so much more. Every one who has looked upon the first money made by their own exertions will understand something of the pleasure which Jenny experienced at this spectacle; but in her case the joy was enhanced tenfold by the peculiar circumstances of her position. Instead of lifelong dependence upon others, here was independence for herself and for *them*.

'Ye will have good news, missie, I reckon?' said the goodwife, as she saw the light leap into her young guest's eyes.

Jenny did not answer, for she was already deep in her ladyship's letter, if depth could be obtained in anything so shallow. It was a long rambling rhapsody upon the Daltons' troubles, dotted with 'so sorry' and 'no one out of my own family so dear,' and not a word about the lace, except in the postscript, which ran thus: 'As to your beautiful work, dear Jenny, we all admire it above measure; but you know an amateur can never compete with these professionals; one can hardly go asking tradespeople what they will give for the production of a young lady—one's own personal friend too—and I am sure it could only result in disappointment; you might work your fingers to the bone, and only gain a few shillings. But if you will let me be the purchaser—just for this once, at all events—I shall be so pleased. I have no doubt you will find a use for the payment which I inclose herewith.'

Jenny's heart did not sink; it was not of the composition that does so, yet it turned heavy and cold. 'They are all alike,' she murmured bitterly; 'all base and cruel alike. This woman could not even ask a question for me, because of her false pride.' She folded the bank-note up very small, and gazed wistfully into the fire. 'That is where I should like to put it,' she went on; 'only she would never believe it.' Then she rose and thanked the woman of the house for her hospitality.

'Lor, missie! don't speak of it. We would all do a deal more for ye than that.'

'Why?' inquired Jenny brusquely.

'Because the doctor has told us all about ye, and whose was the hand that has given many a bit and drop to them as needed it in these parts. You're poor yourselves, I hear, now, missie, but it will nae be for long; the blessing o' the poor is on ye, and ye will thrive yet.' The woman, a hale and hearty one, though old, spoke with earnest energy.

'Thank you, dame,' said Jenny simply, and she felt genuine gratitude. The other's words had put

a strange confidence into her; it was a comfort too to feel that she had confided to no one her intention of writing to Lady Skipton. No one could remonstrate against her returning that five-pound note to her ladyship by the next post. Money in some cases is said to 'burn in the pocket;' but no spendthrift ever felt such a desire to get rid of a bank-note as now burned in Jenny's heart. She did not want five pounds for what was only worth a few shillings. Her ladyship need not have been so afraid of having to buy more lace at that fancy price. 'Just for this once, at all events,' was a phrase of quite unnecessary precaution; but it had wounded its recipient to the quick. 'Work her fingers to the bone.' Yes; she would do that, and more, before she ever appealed to that woman for assistance again, or indeed to any one. She had another string to her bow, which did not depend upon friends (so called) at all, and she now regretted she had not tried it first. If that failed—God help her!

Then she smiled to herself to think of the absurdity of that last reflection; as though we should only trust in God when all other means fail. Such a phrase was surely as ridiculous as Mrs Campden's 'D.V.s,' which she was so careful to introduce in her ordinary correspondence. How angry poor Jeff made her once by telling that story of the old lady who would 'come to tea on Wednesday, D.V., but on Thursday at all events.' By the time Jenny got home—it took her a long time to walk even those few yards—she was quite herself again.

The days rolled on at the Nook for Jenny faster than for the rest; she was used to solitariness, and never tired of reading, and Mr Landell's library gave her endless occupation in that way; almost all the books, though old, were new to her, and some of them very strange and curious. Tales of witchcraft, fulfilments of dreams, treatises upon simples, local superstitions, habits of birds and beasts—the quaintest and most old-fashioned ideas imaginable, whereof one in twenty were really noteworthy, and through desuetude had become novel. Tony, too, after he had done his lessons with her, found employment and amusement enough in the valley; but to Mrs Dalton and Kate the time hung heavy on hand. Mrs Campden and Mary drove over to the Nook occasionally; at first with laudable frequency; then less and less often; sometimes Mary came alone, and was always kind. But her kindness was of quite another sort than in the old days when Kate had been her 'dearest friend.' There was nothing to complain of in Mary—nor did Kate ever breathe a word of complaint against her—but she had evidently overrated the strength of her own attachment. Her visits became briefer, as well as rarer, being cut short by 'pressing engagements' here and there, such as in the old days would not have weighed with her a feather.

The doctor, indeed, called every day, but, unhappily, not as a mere visitor; Mrs Dalton, though she kept 'up and about,' was seriously indisposed, and gave him cause for much secret anxiety. 'My medicines,' he frankly told her daughters, 'can do your mother little good; the true remedy for her would be a letter from your father.'

But none such arrived, although weeks had gone by since Dalton's departure. The postman brought them few letters, indeed, now from anybody; though

there had been one or two from Jeff, speaking favourably upon the whole of his employer, and very cheerfully of his own position and prospects. He seemed to be in quite a responsible post—something altogether above that of a clerk. Indeed, there was nobody over him at all except Mr Holt himself; and yet he was by no means overworked. 'For all which, I know,' wrote Jeff, 'I have to thank dear Mrs Dalton.'

His immediate correspondent was Jenny, who, in return for his own confidences, wrote him a pretty exact account of how matters went on at Sanbeck; all which she well knew would have an interest for him. 'If we could only hear from papa, and mamma were better,' wrote she, 'we should not have much to complain of. Could you find out how long a letter ought to be coming from Rio? for, of course, papa would be sure to send us one by the first mail after his arrival. Would there not also be a chance of the *Flamborough Head*'s meeting a ship coming home, and sending letters by it? We are all so ignorant here, and, alas, so helpless.'

To this Jeff wrote back a cheerful reply, stating in general terms that the arrival of the mails was more or less variable, and that the wind had been contrary; but added a private slip for Jenny's eyes: 'Don't breathe a word of it to your mother, but the Brazil mail arrived some days ago; Mr Dalton could not, therefore, have reached Rio when it left. Indeed, the *P. H.* was mentioned at Lloyd's yesterday as overdue. This is likely enough, with these west winds, and there is really no cause for anxiety as yet.'

'As yet.' Those two little words sent a stab to Jenny's heart.

REMINISCENCES OF FEN AND MERE.

Few men whirled rapidly southward in the 'Flying Scotchman,' and putting out their heads to catch a momentary glance of Peterborough and its cathedral, think of the time, not so long ago, when the fair and fertile region was a swamp pregnant with malaria. We read, it is true, of the ancient time when the forests of Western England were first cleared by monastic colonies, and 'Glastonbury Tor' rose like an island out of a waste of flood-drowned fen that stretched westward to the Channel. And we read, too, how 'wilder even than the western woodland was the desolate fen-country' on the eastern border of the kingdom, stretching from the 'Holland,' the sunk, hollow land of Lincolnshire, to the channel of the Ouse, a wilderness of shallow waters and reedy islets, wrapped in its own dark mist-veil and tenanted only by flocks of screaming wild-fowl; how here, 'through the liberality of King Wulfere, rose the Abbey of Peterborough; and how here, Guthlac, a youth of the royal race of Mercia, sought a refuge in the solitudes of Crowland; and so great was the reverence he won, that only two years had passed since his death, when the stately Abbey of Crowland rose over his tomb. Earth was brought in boats to form a site. The buildings rested on oaken piles driven into the marsh. A great stone church replaced the hermit's cell, and the toil of the new brotherhood changed

the pools around them into fertile ground.' The Abbey of Ely, stately as that of Crowland, was founded in the same wild fen-country by the wife of Egfrith, king of Northumbria. But in his *Reminiscences of Fen and Mere*, the volume now under consideration, Mr Heathcote deals with the days of his own boyhood, and we will follow the story as he tells it—the story of the eastern fens, of the district 'bounded on all parts by highlands, from that point of land about Hunstanton in Norfolk to Winthorpe in Lincolnshire.'

That great fen-level comprehends some seven hundred and fifty thousand acres of land, of which, in South Lincolnshire alone, so recently as 1817, seventy-five thousand acres lay under water for the greater part of the year. In a curious notice of the ancient condition of the inhabitants of this damp county, we find its little townships thus described: 'They were small, rustical, and wild; the fashion of their houses had little changed since the days of the ancient Britons. The houses, or huts, were of a round shape, and not unlike the form of bee-hives. They had a door in front, and an opening at the top to let out the smoke, but window to let in light there was none. The walls were made of wattle and daub. The roofs, of rushes or willow branches, cut in the fens.' The condition of an Eskimo's hut would be about as comfortable. Fennmen still use the same pole which was in fashion eight hundred years ago, when we find a young novice in Crowland Abbey making his way to Spalding with a leaping-staff 'fashioned like the staff of a pilgrim; the lower part armed with a heavy iron ferrule, from which projected long steel nails and spikes.' In those days 'the kingfisher flitted across the traveller's path; the wild duck rose from the fen, and flew heavenward; the heron raised itself on its long legs to look at him from the sludge; the timid cygnet went sailing away in quest of its parent swan.' The Isle of Ely—now so fertile, which takes its name from *Hebig*, the British name for willow, on account of the willow-trees which grew into almost impenetrable forests there, concealing the marshes and quagmires beneath them—was to all intents an inland island, surrounded on all sides by lakes and meres and broad rivers. Three thousand eels, taken close under the very walls of the abbey, were by ancient compact paid every Lent to the monks of Peterborough, for leave to quarry stones in a quarry appertaining to Peterborough Abbey. And ten times the number might have been paid, and not been missed, says the old chronicler. That this vast marsh had once been dry firm land, undisturbed by the stagnation of fresh, or the inundation of sea water, is sufficiently proved by the great number of trees which have been dug up, such as oak and fir, which will not live in water. Curious little incidents are perpetually occurring, when the soil is dug down to any depth; for instance, at Whittlesea Mere, eight feet below the moor, the diggers came to a perfect soil, and swathes of grass lying as they were first mown

down; and at Skirbeach sluice, near Boston, there was found, at sixteen feet deep, covered with silt, a smith's forge and all the tools thereunto belonging; at a still greater depth, furze bushes and trees have been found standing in solid earth below the silt; while the earthy strata of the fens have proved a perfect mine of interest to the geologist, who has found remains of hippopotami, rhinoceros, ibex, elephant, and walrus among the buried treasures. We find, in ancient days, the wild boar of the fen so plentiful that the head only was served up, while in later days, 'it was facile to snare the crane, the heron, the wild duck, teal, the eccentric and most savoury snipe, the swallow-kite, the swarth raven, the hoary vulture, the swift eagle, the greedy goshawk, and that gray beast the wolf of the weald.'

Crowland lay amongst the deepest fens and waters stagnating off muddy lands, so shut in and environed, Camden writes, as to be inaccessible on all sides except north and east, and that by narrow causeways. And with an apology for comparing small things with great, he says it is not unlike Venice! 'consisting of three streets, divided by canals of water, planted with villas, and built on piles driven into the bottom of the fen, and joined by a triangular bridge of admirable workmanship.' Dugdale, whom Mr Heathcote largely quotes, says that the overflowing of rivers made a deep lake, rendering the place uninhabitable except in high places where the monks resided, and to which there was no access but by navigable vessels, except into Ramsey 'by a causeway raised on the one side thereof.' In these precincts was Ely placed, encompassed on every side by fens and waters. On the borders of this district is Connington Castle, which in 1753 was purchased, with the manor thereunto appertaining, for two thousand five hundred pounds by Sir John Heathcote. In those days it was possible 'to get into a boat from the windows of the dining-room on the ground floor, and paddle off to shoot coots on Connington Fen. The farm-horses used to plough with wide boards attached to their shoes by straps.' As recently as 1805, a small cutter was brought into Whittlesea Mere (now all under cultivation), which drew two feet of water, and had a large mainsail, foresail, and jib, a cabin where eight persons could dine, an after-cabin, sleeping-berths, and a kitchen. In that small craft, for many a year, parties were made for sailing and fishing. Professor Selgwick relates how, in 1809, he started from St John's College, Cambridge, and walked all night, that he might join his friends at Whittlesea for a merry day's fishing on the mere. In 1842 there was a regatta on the mere; and not few are the regrets of the naturalist, who can recall the days when a pike weighing fifty-two pounds was taken from the lake, and the great copper-butterfly glistened in the sun. To him it is small compensation that 'over the habitat of the fen-fowl *Ceres* now pours her golden gifts.' The whole country, extending, as we have said, from Hunstanton in Norfolk to

Winthorpe in Lincolnshire, and embracing some seven hundred and fifty thousand acres, was the delight of artists and of every one else capable of appreciating the kind of beauty Cuyp and Ruysdael, Teniers and Hobbima, have cared to paint. With the enthusiasm of a true fenman, Mr Heathcote writes: 'Those who have studied the principles of Dutch art, and know the basis on which the fame of that school permanently rests, will acknowledge that the fen-country, *when in an undrained state*, teemed with the beauty which the artists we have quoted above have embodied in their works. Here,' he says, 'were found the same long flat lines, the same richness of local colour, arising from an exuberant flora, the forms of cattle reflected in the drains, the mills, the dwellings, dress, and habits of the inhabitants, the boats which navigated the rivers, and the same conspicuous atmospheric effects, contingent on the exhalations, rising and falling above the swampy surface. All these objects are included in the term picturesque, and from time immemorial have been a source of inspiration to those who desire to represent the real appearances of nature.' But perhaps, in the eyes of the artist or the student bent on a holiday, the fens were never more enchanting than in time of frost; when cottages 'modern thought has learned to despise and calumniate,' with willows and trees denuded of leaves, made picturesque groups, and the mills stood out bare and gaunt against the sky; and it was possible to skate from Connington to Ely Cathedral and back in the course of a winter's day. Indeed, in 1799, one Francis Drake, an officer of the Bedford Level Corporation, is said to have put on his skates at Whittlesea, and crossed both the Middle and South Levels without taking them off; a distance of nearly fifty miles.'

During the continuance of frost, 'the occupation which excited the greatest interest was a skating race. A good surface of ice gave as good a prospect of competition, and as happy a holiday, as a day of the Derby.' The candidates for the prizes, Mr Heathcote says, came from the surrounding towns and villages of the fens, and much rivalry was excited between them. The prizes offered were a cocked-hat, a pig, or a purse containing from one pound to twenty pounds. But life in the fens, even on its picturesque side, was not all holiday. 'During frost, when the rivers and drains were frozen, and when high-land work was slack, a winter harvest commenced. The cutting of reed and sedge was a busy and interesting scene. A gang of ten or twelve labourers in rich, warm, stuff jackets and high fen-boots, were employed in cutting white reeds fourteen feet high, with brown feathery flowers in filaments at the top. The reeds were laid in bundles, piled in sledges which ran on marrow-bones, and were removed along the ice to the entrance of the lodges or rivers where they were stacked, and left for further removal when the river-navigation was open. The sedge was mown; and the scenes presented during the harvest-days were exceedingly picturesque.' We can easily believe it, and also that the rarest butterflies and the richest wild-flowers were to be found in the same neighbourhood. But to all this pleasant picture there was another side.

Those same 'conspicuous atmospheric effects,' so

precious in the eyes of the artist, could not conceal the malaria which lurked beneath them. The 'old draining-mill' was a picturesque object enough, but it did not save the land from being for weeks at a time under water, when the winds happened not to blow, and its cannibrous machinery was at a stand-still. It might be pleasant for the squire to get out of his dining-room windows to a boat, and paddle to a day's shooting; but it was less so to his steward, 'who, when he drew on his fen-boots in the morning, left the floor of his cottage and the legs of his bedstead covered with water.' Cottages with fireplaces but with no egress for the smoke, are familiar to the mind of the Arctic traveller, but scarcely compatible with English ideas of civilisation. In honest truth, the whole *morale* of the fens, social and physical, up to some thirty years ago, was at an exceedingly low ebb. Dr Adam Mercer, writing in 1505, says of the fen country: 'It is one of the most brute and beastly of the whole realm, a land of marshy agne and unwholesome swamps.' The oldest Anglo-Saxon poem we have, of any considerable note, the legend of Beowulf, speaks of the monster Grendel, born and bred in the marshy swamps of Lincolnshire; and some modern interpreters have even gone so far as to believe the monster with his deadly grip, coming ever in the night to destroy the bravest in the land, to be but another name for the deadly malaria which was exhaled from those dreary fens. In 1620, we find James I. 'for the honour of his kingdom determined no longer to suffer these countries to be abandoned to the will of the waters, nor let them lie waste and unprofitable,' but 'did himself undertake by a law of sewers a great work of drainage.' But the design was opposed by those corporations to whom all progress is evil, or as the old chronicler Mr Hentzote quotes, puts it: 'He who will do any good in sewaging must do it against the will of such as shall have profit in it.' An old ballad quoted by Dugdale, in his History of the Fens, in 1620, shews the spirit in which innovation was regarded by the fen squatters. Here are two of the verses:

Come, brethren of the water, and let us all assemble
To treat upon this matter, which makes us quake
and tremble;

For we shall rue it, if it be true the fens be undertaken;

And where we feed on fen and reed, they'll feed
both beef and bacon.

The feathered fowl have wings, to fly to other nations,

But we have no such things to help our transportations;

We must give place—oh, grievous case—to horned beast and cattle,

Except that we can all agree to drive them out by battle.

Macanlay, writing of the condition of the fen-country at the close of the seventeenth century, speaks of 'a vast and desolate fen, saturated with all the moisture of thirteen centuries, and overhung the greater part of the year by a low gray mist, above which rose, visible many miles, the magnificent tower of Ely.' In that desolate region, covered by vast flights of wild-fowl, he says, 'a half-savage population, known by the name of Breedlings, led an amphibious life, sometimes

wading, sometimes rowing from one islet of firm ground to another.'

In many a parish of the 'Holland' of Lincolnshire, even so late as the middle of the present century, ague and opium-eating went hand in hand. In 1793, Arthur Young reports 'that numbers of sheep die of the rot when depasturing in the drier parts of the fen during the summer months; that the number stolen is incredible; they are taken off by whole flocks; whole acres of ground are covered with thistles and nettles four or five feet high, nursing up a race of people as wild as the fen.'

In 1795, a thousand acres in Blankney fen were one of the most fertile parts between Lincoln and Tattersall. They were let by public auction at Harecastle, and the reserved bid was ten pounds for the whole tract. More or less was this the state of things before 1810. Since then, all has been changed. The Middle Level Act was passed in 1844, and the lands of the Middle Level were taxed to the amount of two hundred thousand pounds; a subsequent Act imposing a further tax of two hundred and thirty thousand pounds. Engineering works for the drainage of this vast area were commenced and vigorously carried on; the task was an herculean one that had to grapple with seven hundred and fifty thousand acres of water; but the day was won. 'In 1850, the water finally left the bed of Whittlesea Mere dry. It had been made to flow out by a small cut of the New Middle Level Drainage at Folkester Point, on the north-west side.' And now here, as over the whole district, came the question of the fertility of the land: would the huge experiment pay? A few facts may suffice. Within the space of thirty-five years, Mr Heathcote tells us, the annual rental of two hundred and fifty thousand acres, forming one-third of the area comprised in the Bedford Level, has increased one hundred per cent. An estate near Marshland, which before the drainage sold for seven thousand pounds, has lately been purchased for fifty-seven thousand pounds. Land near Ramsey which sold for ten pounds is now worth forty pounds an acre. Land once mere marsh and snipe ground is now yielding returns which may be estimated thus, according to Mr Heathcote's calculation: Three thousand acres, formerly the bed of Whittlesea Mere, now corn-land and pasture, furnish wheat for three thousand three hundred and twenty-nine persons; oats for three hundred and seven horses; beef for three hundred and eighty-two persons; mutton for three hundred and six. Add to this the whole question of the storage of the water drained away, about which we will give one detail with one set of results. The Ely Level Board of Health has been in existence only five-and-twenty years. The total cost of its water-works was sixteen thousand pounds. The population of the town is eight thousand. *All cesspools have been abolished.* Thirty-five gallons of water per day are allowed to each person, and an unlimited supply to the town. The decrease of mortality is from 25·60 per 1000 in 1841-51, to 19·55 in 1861-71. It is all very prosaic, no doubt; but a diminished death-rate, higher wages, better food, may well compensate for the loss of 'conspicuous atmospheric effects, gorgeous butterflies, and savoury snipe in a great district, rendered by sheer force of modern industry one of the most fertile and most healthy, instead of the most miserable in the

whole land. After all, poet and artist would do well to remember, that turning a swamp into a corn-field is but the nineteenth-century version of causing the wilderness to blossom as the rose.

A DILEMMA.

IN TWO CHAPTERS. CHAPTER II.

THE two young men were fairly off Mr Duhamel's ground before they exchanged a word. Marco Castelli did not often begin a conversation, especially in English, and Emile was fairly at his wits' end; at last he spoke.

'What am I to do? I believe the best way would be to leave here at once, and when we are safely back in France, write to Miss Duhamel, and tell her the whole story. Neither she nor her father would hear it to-day.'

'Yes,' said Marco, who had simply come to England because Emile did, and who had no desire to stay there—'yes, that is best.'

'But then—poor Eugène—I say, Marco, what a beauty she is!'

'Very pretty,' assented Marco.

'Pretty! She is perfection! We should be fools to go away without seeing more of her. And yet, she cannot have cared a bit for Eugène.'

'English people have no hearts,' said Marco dryly, delighted at being successful in remembering that favourite calumny.

'Nonsense, my friend,' answered Emile sharply. 'Besides, she is not English. She was born in England, and had an English mother; that's all. Otherwise, as pure French as I am.'

Mr Duhamel was impatiently looking for his guests when they re-appeared at seven o'clock. Claire, lovelier than ever, was sitting about, and saying a word now and then to her cousin about Eugène. The June evening was still light and warm; and the flowery drawing-room, with its abundance of colour and perfume, was a fit shrine for such a dainty nineteenth-century nymph. So Eugène's representative thought, as his eyes greeted her, and a pang of envy—envy of his lost friend—went right through his heart, and shocked him. The puzzle of the morning was not solved. He had told Mr Duhamel, and Claire herself, that Eugène was dead. Either they were rather glad of it, or they did not believe him. But if they did not believe him, why did they not treat him as a rogue, an impostor? And how could Claire be glad of her freedom, she who had written those letters, full of innocent girlish affection, which his dead friend had bidden him read?

'I will let things go,' was Emile's last resolve. 'It is a midsummer night's dream, and I'll make no further effort to break it.'

It would have been pleasanter, perhaps, if Mr Duhamel had not seemed to take such a singular pleasure in calling him by his name. He could not even say: 'Monsieur de Bellechasse, will you take Claire in to dinner?' without a pomp that made it sound as if he had said 'Monsieur le Marquis de Carabas;' and he looked so excessively mischievous and knowing, that he was a most embarrassing host. Miss Burton looked a little puzzled too, and evidently examined both the guests with some curiosity. She made herself very agreeable to Marco, who, finding that she could speak Italian, ventured to disregard his leader, and refresh himself with his native tongue. After

all, however, other people might be or do what they liked, they could not much affect Emile's happiness. Claire sat beside him, Claire smiled upon him, Claire talked to him with the grace and gaiety which he had found in her letters; Claire was rapidly dazzling the young man into that condition of blissful folly sometimes heard of as 'love at first sight.' She was so happy herself! She had quite forgotten what the story was with which her Eugène had introduced himself. He was pretending to be somebody else—perhaps to test her constancy to his imaginary absent self—and her clever father had found him out; that was enough for her. Since he was everything she wished in other respects, that one little whim might be forgiven him. The test was easily stood.

After dinner, the gentlemen, none of them being English, followed the ladies out of the dining-room; but on their way to the drawing-room, Mr Duhamel renewed Emile's doubts of his sanity.

'Are you satisfied now, Monsieur de Bellechasse?' said he, aside, 'or do you mean to keep up your comedy through another act? You might as well take me into your confidence, for you can't deceive my eyes, you see.'

He trotted off, after this mysterious sentence, with such an intensely knowing expression of countenance, that the unfortunate messenger of evil tidings had almost fled from the house and its enchantments there and then. In his distress, he was suddenly aware of a pair of serious and lustrous eyes regarding him. They were those of Miss Burton; and with a sort of gasp of relief he took deep into his mind the conviction that she, at anyrate, was sane, and safe—neither bewitched nor bewitching. 'She knows what it means, and will tell me,' he said to himself; but how to speak privately to her? She was still good-humouredly giving her attention to Marco, and Emile himself would have been the sport of perplexity for ever, rather than voluntarily desert the girl, who seemed tacitly to claim him. Mr Duhamel regarded the young people with looks of delight. He hovered round them, putting in a word now and then, and making Claire shew off for the benefit, or to the undoing, of the helpless victim. At last she was bidden to sing, and while she was turning over her songs, and calling upon Anne for advice, Emile found an opportunity of whispering to his companion: 'Ask what it means. You must find out why they treat us in this way.' Marco nodded; but Emile did not feel certain that he had understood; for many of the sayings which were most irritatingly problematical to him, had never reached the Italian's consciousness at all.

At last the evening was over, and the mid-summer night's dream was a more complete, more entrancing dream than ever. The two cavaliers walked slowly away through the dewy darkness, and one of them kept his head turned till the very last possible moment towards the white-robed figure lingering at the open window.

She seemed a splendid angel newly drest,
Save wings, for heaven,

he repeated to himself; and then:

Her very frowns are fairer far
Than smiles of other maidens are.

M. de Bellechasse prided himself greatly on his acquaintance with modern English poetry, but

the appropriateness of his quotations did not trouble him. He came back to prose with a sigh, and a comfortable recollection that Marco would not understand him, and eagerly inquired: 'Well, what does Miss Burton say?'

'Says that you may be Eugène Bertand.'

'What? That I am?—'

'Eugène. That you perhaps pretend to be Do Bellechasse.'

'Good heavens! They are mad, then! Explain!'

'In Italian, then?'

'As you will.'

Marco then proceeded to state that Anne, questioned by him, had honestly told him the true state of the case. She had, perhaps, already begun to suspect that her uncle was mistaken, for had she not reasons of her own to doubt his discernment? She, upon the whole, believed Marco when he assured her that his companion was not Claire's betrothed; but when he begged her to make Claire and her father understand, she positively refused.

'I should offend my uncle, and throw Claire into confusion and distress,' she said. 'I strongly advise you and your friend to let the mistake go uncorrected for a little longer—that is, if Monsieur de Bellechasse admires Claire as much as he seems to do.'

'Admire her!' repeated Emile, when Marco had conscientiously reported this advice. 'I have admired plenty of women, but I never saw one like this. Wise Miss Burton; I will do as you bid me; but for how long?'

'Let the mistake go uncorrected,' Anne had well said; but in saying so, she reckoned without her host. Mr Duhamel was far too proud of his discernment not to be impatient to force his future son-in-law to confess.

The two young men were to be at Mr Duhamel's in good time next morning. Both Claire and her father had willed it so; and Emile had been too weak to say 'no.' He had argued with himself that it was impossible for him to run away while they were in their present position; and propped by Anne's advice, he meant to take all the good provided—and wait. But as he walked up to the house, his mind was still unsettled and uneasy. A harum-scarum by nature, and already fathoms deep in love, the temptation to yield, and allow himself to play the rôle forced on him, was great indeed. Yet, on the other hand, he shrunk from defrauding at once the dead Eugène, and Eugène's betrothed. And finally, honour got the better, for the moment, of love. 'I am going to compel them to believe the truth,' he said to Castelli. 'I shall have a fight with the old gentleman, and get it over. Poor girl!'

'Stupid old man,' answered Marco, with his usual deliberateness.

Mr Duhamel met them at the door, and Emile begged for a few minutes' conversation, and was taken to the scene of their first meeting.

'Well, Monsieur de Bellechasse,' Mr Duhamel began in great good-humour, without giving him time for a word, 'you have something particular to say to me?'

'I must beg you to believe me to-day'—Emile commenced, very earnestly.

'Yes, yes, my dear boy, of course'—

'What I told you yesterday,' he went on.

'I forgive you,' said Mr Duhamel heartily. 'And so does Claire. We know all about it, you see.'

'Will you tell her, then?' Emile answered, beginning to believe that Mr Duhamel *must* know what he was talking about. 'Let her understand that I had no intention of deceiving her'—

'Or, at anyrate, not much,' interposed the other; 'and quite innocently. But I hope you are satisfied *now* that she loves you?'

'I believed that she loved Eugene'—

'And that she *likes* Monsieur de Bellechasse, eh? As you please. And you don't *dislike* her?'

'I love her with all my soul,' cried poor Emile in despair. 'But pray, listen'—

'*Claire! Claire!*' cried Mr Duhamel; and before another word could be spoken, Claire, beautiful and bright as the summer morning, stood in the room.

'He has confessed, my child,' said her father laughing; 'and he says he finds you tolerable. So, what do you say?'

She said nothing; but put out her pretty little hand, and Emile, for all the world, could not have put it away from him.

'Bravo! bravo!' chuckled Mr Duhamel. 'Did not I say so, Claire? Did not I say so?'

'Dear Eugene,' said Claire, 'why did you try to deceive us? Was it for your own sake, or mine?'

'Did not I tell you he was romantic?' asked her father impatiently.

'You might have trusted *me*. Don't you remember what I wrote to you?'

'Could I forget it?' Emile answered. 'Oh, if I am to be cross-questioned, I shall be found out without fail, and just as I had given in,' he thought with disgust.

'What did I say?' Claire went on. 'Was it not that I never had thought, and never would think of anybody but you?'

'You said that,' Emile answered boldly, 'to Eugene'—

'And you answered,' she went on. 'What?'

'Why oppose her? She will not hear me,' said Emile to himself. Then aloud: 'Did not my answer please you?'

'Yes. But I want you to repeat it.'

'When I have said a thing once I mean it always,' he replied.

'But perhaps not this, because you had not seen me. Say it, if you mean it *now*.'

'Heaven help me!' thought Emile. 'But why should I have changed, Claire, since you are all, and more than all, I fancied?'

'Oh, how obstinate you are!' cried Claire, drawing her hand away from him. 'Papa, he will not say it, because he does not like me.'

'Now you mean to quarrel, do you?' said Mr Duhamel, laughing. 'I see I must settle it. Give me your hand, Claire.—Now, monsieur, do you care for this present I have here for you? It is precious, and deserves to be valued.'

Claire, between anger, fear, and innocent love, was watching his face keenly—to hesitate for a moment, would be, he felt, to lose her for ever.

'Only give her to me,' he answered; 'you shall never find me ungrateful.'

'Bravo! bravo!' cried Mr Duhamel again, and in a trice was out of the room, calling Anne as he bustled into the drawing-room.

An arrival had taken place there during his

absence. Sir George Manners was sitting near Anne, and telling her how he had been able to get away from London last night instead of this morning.

'Ah, Sir George!' cried Mr Duhamel, delighted to see him. 'Back again already? I wish you joy, my dear sir—I wish you joy!'

'Thank you. And you are to be congratulated too, I hear?'

'Yes. I have just left them together to settle their own affairs. A fine young man as one could find anywhere. Exactly what I always thought my dear old friend's son would be.'

'But rather whimsical, I should guess?'

'Ah, Anne has told you. Romantic, Sir George, romantic. These young people *will* be foolish. But he has confessed now, so we will say no more about it. And about yourself, my good neighbour?'

'I find I am sure of the money, Mr Duhamel.'

'There now; I could have told you beforehand what you would say. At Eugene's age, for instance, the lady is everything, and the money nothing. At yours, men are wiser. Sure of the money, eh? So much the better. The lady *brings* the money, so that's all right.'

'Not in my case, Mr Duhamel. You always warned me to expect my step-mother to defraud me. But for that, I should probably have tried to get a wife long ago.'

'Yes, of course I did. And I turned out right, you see.'

'Not quite right in the end. She quarrelled with her husband, and forgave me. Her death, about three weeks ago, has given me back all that my father left to her.'

Mr Duhamel gazed at his visitor with a face where dismay gradually gave way to congratulation. 'Well, well; I always said you would get nothing from her while she *lived*,' he said emphatically. 'And so now you have got two fortunes?'

'Only one. And I am reasonable enough to be satisfied.'

'But you said just now that you had made sure of your bride's money?'

'No, Mr Duhamel; only of my father's. As for my bride, I hope I am sure of her, but I should like to have your consent.'

'My consent?' repeated Mr Duhamel, bewildered.

'Yes, please, dear uncle,' said Anne, quietly coming to the side of her lover.

'What! Anne? What do you both mean?'

'Uncle, you do not wish me to be an old maid?' murmured Anne, smiling.

'No, child, no. Bless me!' said Mr Duhamel, 'who would ever have thought it? But she has no money at all to speak of!'

'Quite enough for me,' answered Sir George; 'thanks to my step-mother.'

Mr Duhamel here left the pair and trotted back to the study, where Claire and Emile were entertaining one another. 'Come with me, young people,' he said, 'and don't fancy you've got all the love-making to yourselves. Ah, I *did* suspect it once.' He led the way to the drawing-room, and announced cheerfully: 'Here is my son-in-law, Sir George—fairly caught at last, you see.'

'De Bellechasse!' cried Sir George, as Emile came in with Claire; 'are you here? Welcome to England!' and while they shook hands, he looked

expectantly for the appearance of Mr Duhamel's son-in-law, Eugène.

'De Bellechasse!' repeated Mr Duhamel and Claire together.

'Certainly,' answered Sir George. 'I did not know you were acquainted.'

'But, my good fellow, this is Eugène Bertrand,' assuaged Mr Duhamel.

'Mr Duhamel,' answered Emile, 'do me the justice to own that I never said so.'

'You called yourself De Bellechasse, certainly,' Mr Duhamel owned—'for a whim.'

'Was it for a whim that I was called De Bellechasse in Paris, Sir George?'

'I have no reason to think so. Your conduct has always been honourable and straightforward. But what does all this mean?'

Claire had left Emile's side, and clung fast to her father's arm; both father and daughter looked confounded. It was Anne who came to the rescue.

'My dear uncle,' she said, 'you have only made a slight mistake, and one easily mended. This gentleman is *not* your old friend's son, but he seems very willing to act as if he were—why not let him?'

'Yes,' added Emile eagerly; 'only try me, Mr Duhamel. Claire, don't, I beg of you, *don't* send me away!'

Claire could not help smiling; and Mr Duhamel saw a way out of his dilemma.

'As you will, then,' said he, suffering his good-humoured face to beam on the circle. 'But you are the only people I ever knew who were clever enough to mislead me.'

THE MONTH:

SCIENCE AND ARTS.

THE *Challenger* has returned from her three years' voyage round the world laden with specimens of plants and animals, with samples of the sea-bottom from many latitudes, and with observations and theories, all of which, when sifted and classified, will be taken into the service of physical science and of natural history. Two hundred cases of specimens, in addition to the prodigious heap previously sent home and stored in the cellars of the University of Edinburgh, imply an amount of work yet to be done in description and classification which seems overwhelming. It may be that Professor Wyville Thomson will find this harder work than the work of collection was amid vicissitudes of wind and weather. But not until it has been done can the results of the voyage be satisfactorily known. A popular account of the memorable cruise will in all probability be published before the end of the present year; and some years hence the scientific account of the voyage, with its discoveries, its facts and conclusions, will appear in a goodly series of quarto volumes with appropriate illustrations.

The *Pandora* yacht has sailed once more for Greenland and the Polar Sea to pick up news, if possible, of the Arctic expedition. It is thought by some naval officers, that if Captain Nares had a favourable season last year, he may, with the heroism of a first onset, have succeeded in reaching the Pole. Should this be the case, the *Pandora* will meet him coming home in triumph.

Notes of a Voyage to Kerguelen Island to observe the Transit of Venus, December 8, 1874, is the title of a small book which is well worth reading. The author, Rev. S. J. Perry, was one of the scientific men who volunteered to go out to that land of Desolation for the advantage of astronomy, and indeed of physical science generally. A man must be thoroughly in earnest when, in order to make observations of a transit, he sails away to a lonely island three thousand miles from human habitation, through a region of mist and storm, where, during three weeks of every month, the wind blows a gale, and the greatest waves in the world are upheaved. All this, and the severity of the labour in a wild climate, and passages of daily life, and touches of adventure, are well described.

A few sheep, carried from the Cape of Good Hope, were turned loose on the island, and liked liberty so well, that, when they were 'wanted,' they took to the hill-tops, and could only be captured by stalking. A small number escaped, and if, as Father Perry says, 'they are not dead of cold, they may still be enjoying their freedom on the Kerguelen hills.' Small colonies of rabbits were established in boxes in different parts of the island, in the hope that they would increase and multiply. The botany of the island was allotted to a young curate of the Church of England, who collected plants with praiseworthy activity, with addition of specimens of natural history.

By way of turning the South Kensington Exhibition of scientific apparatus to profitable uses, a series of conferences has been held in the various branches of physical science represented by the instruments. Natives and foreigners have met at these conferences, and we may assume that one of the effects will be to establish a community of scientific opinion among those who cultivate science throughout Europe. To the cultivated observer there is something especially instructive in the contents of the long ranges of glass cases; and the thought will perhaps arise that past generations were not so benighted as we fondly imagine them to have been. Galileo's telescope, for example, is found to be a good telescope, and the favoured few who have looked through it down the long galleries of the Exhibition declare that objects are seen with surprising distinctness. Another thought is suggested by observation of the apparatus with which Faraday and other philosophers worked—namely, that genius achieves its object with the very simplest appliances. Given the genius, one may be trusted to make his research even without endowment; and he will outstrip those who put their trust in costly and complicated apparatus. Other famous names are similarly illustrated; and any one who walks through the Exhibition, catalogue in hand, remembering how much lies beneath the surface, will not fail to carry away an impression that may animate him for the rest of his life.

A Society of Public Analysts has been formed to promote and maintain the efficiency of the laws relating to adulteration—to secure the appointment of competent public analysts—to improve the processes for the detection and quantitative estimation of adulterations, and to secure uniformity in the statement of the results, by holding periodical meetings for the reading and discussion of original papers on chemical and microscopical analysis, especially with reference to the detection

of adulteration. The new Society shew that they are in earnest by publishing the first volume of their *Proceedings*, containing reports of meetings and of the papers read, with statements of legal cases and results. Among others there are papers on the detection of alum in bread—on milk—on natural constituents of wine—on butter, pepper, tea, and other articles, all connected with the general question. A Society willing to do so much for the advantage of the public generally surely deserves to prosper, and find members in every town in the realm.

Dr Stokes, Regius Professor of Physic in the University of Dublin, in the course of a lecture on Sanitary Science in Ireland, stated that there are in Dublin a thousand houses unfit for human beings to live in. 'I believe,' he continued, 'that this estimate is far below the mark. The Reports of our nuisance inspectors remind me of early days spent in visiting the poor in the Liberties of Dublin, since which time decay and destitution have been doing their work fourfold in all the poorer parts of our city. The marks of physical degradation in the inhabitants are sickening to look at: the ill-developed frame, the pallid and hollow cheek, the sunken eye, all tell of a population through which endemic and epidemic disease run riot.' As regards the origin and propagation of contagious diseases, Dr Stokes is of opinion that we know less than is commonly supposed; and he says: 'I believe that we must mainly trust for disinfection to cleanliness in the widest acceptation of the word.' The lecture is published in the *Journal of the Royal Dublin Society*, along with papers 'On the Discrimination of Good Water and Wholesome Food'—'On the Geographical Distribution of Disease'—'On the Prevention of Artisans' Diseases'—and other subjects; all of which may be read with advantage by any one interested in sanitary science.

From a paper read at a meeting of the Institution of Civil Engineers, we learn that the breakwater at Holyhead is seven thousand eight hundred and sixty feet long, and that it shelters a harbour comprising four hundred acres of deep water. The base of the breakwater was formed by dropping into the sea lumps of stone of all sizes, the refuse of the neighbouring quarries, until a mound arose broad and solid enough to serve as foundation for the masonry of the superstructure. The depth of water varies from forty to fifty-five feet; hence it is not surprising that seven million tons of stone were required for the whole work. The dropping was carried on from railway trucks running on timber-stages, built temporarily in the sea; and the daily quantity thrown down was about four thousand tons. The cost of the breakwater was one million two hundred and eighty-five thousand pounds.

A good work has been done at the mouth of Carlingford Lough, in Ireland, by dredging a navigable channel through the bar, and thus giving access to the twelve hundred acres of safe anchorage inside. The bar was composed of blue clay and boulders, some of them four tons weight. These were raised by chains and a crane; but stones of thirty hundredweight could be lifted by the dredge. The maximum weight raised in a single day was four thousand tons.

The subject of another paper read at the same place was the Pneumatic Transmission of Tele-

grams. The length of the pneumatic or air tubes in London is nearly eighteen miles. There are five tubes in Manchester, four in Liverpool, three in Dublin, three in Birmingham, and one in Glasgow. Small tubes can be worked more economically than large ones; a blast costs less than a vacuum; and it is found that lead tubes are more suitable for the work, and more durable than iron. The 'carriers' in which the bundles of telegrams are despatched are cylindrical boxes of gutta-percha covered with shrunk druggel, and their weight is less than three ounces.

A curious fact was related at a meeting of the Institution of Mechanical Engineers, namely, that a blasting-furnace in which a rich quality of iron has been smelted for some time continues to produce an equally good quality for a few days after the 'burden' has been changed; that is, after inferior ore has been put into the furnace. The explanation appears to be, that during the first smelting the furnace becomes saturated with carbon, which has a beneficial though temporary effect on the subsequent charge.

Another fact is, that in some of the saw-mills in the United States, circular saws are used with loose teeth, which can be taken out to be sharpened. Holes or recesses are drilled in the edge of the saw disc; the shank of each tooth is made with a dovetail which, when put into the hole, is turned round and thereby secured in its place. It is obvious that, if a few sets of teeth are kept always ready, the blunt ones may be taken out and the sharp ones put in with but little loss of time.

An account of another curious fact is published in a recent number of the *American Journal of Science*. 'Several years ago,' remarks the writer, 'after spending a portion of the day in experimenting with phosphuretted hydrogen, prepared from phosphorus and solution of potash, on retiring to bed I found my body quite luminous, with a glow like that of phosphorus when exposed to the air. Either some of the gas having escaped combustion, or the product of its burning, must have been absorbed into the system, and the phosphorus afterwards separated at the surface have there undergone slow combustion. I was conscious of no feeling that could be attributed to it, nor was my health apparently in any way affected by it.'

The Gas question has been discussed at the two ends of the kingdom: in London before the Institution of Civil Engineers by Mr Suggs, who stated that by his system one standard burner only was proposed for all qualities of gas. It can be easily gauged and verified. When used with sixteen-candle gas, it burns five cubic feet per hour with a three-inch flame, the light from which is equal to that given by sixteen sperm candles at six to the pound. At Newcastle-on-Tyne, Mr Pattinson, President of the Chemical Society, after describing his experiments with various burners, said: It thus appears that burners are in use in Newcastle which give a light equal to only three and three-quarter candles, with the same quantity and quality of gas as would give a light equal to seventeen and three-quarter candles when burned in a good argand, or twelve and a half candles in a good burner of its own class. From this we gather that if consumers will be careful to use proper burners, they will gain from three to five times the amount of light given by the improper burners. Besides

the saving in the cost of gas, there would be, as Mr Pattinson observes, 'the additional advantage of having the vitiation of the air in the room by sulphur compounds and carbolic acid from the burning gas reduced to the same extent.' He publishes his results, in the hope that public attention will be called to the question.

A fact which may be of use to workers in metal is mentioned in the *Journal* of the Chemical Society. A firm in Germany have invented a new grinding or polishing stone, which is prepared with emery, water-glass, and petroleum, and thus differs from those formerly manufactured of gun, shellac, and emery; a composition which, when it became warm, lost its grinding property. The new stones may be set spinning at the rate of from one to two thousand revolutions a minute without the same tendency to heat, and can therefore be used for the grinding of steel, if the surface be moistened from time to time with petroleum. The inventors of these stones are Van Baele & Co. of Worms.

We learn from the same *Journal* that the pyrites dug from the mines near Meggen is treated in such an ingenious way that it yields a number of valuable products. In the first place it is the raw material for most of the sulphuric acid works in Germany; it yields six per cent. of zinc, and Glauber's salt in crystalline masses, and the refuse on exposure to moisture forms a beautiful red powder which can be advantageously used for polishing certain kinds of plate-glass.

The President of the Tyneside Naturalists' Field Club, in his last anniversary address, presented many interesting facts in natural history, among which the following may perhaps be thought worth attention by general readers. 'I have long thought,' said Mr Carr-Ellison, 'the heel-claw of the skylark and its congeners one of the clear demonstrations of beneficent design in organisation, to enable ground-roosting diurnal birds, of small specific gravity, to pass the night, not squatting, but crouching, and fronting the storm, without being either blown away or frozen to the ground. Neither the skylark nor any of its congeners could roost upon the ground, as they do, in winter, and in rainy windy weather, without the support of such a heel. They would be frozen to the ground; for they are diurnal birds, and sleep soundly at night. They do not keep shifting their position like the wakeful peewit and gold-plover; nor can they betake themselves to hedges, as the buntings do when the ground is wet. Hence I take the liberty of reading the lesson of the lark's heel in my own way, heedless of all that evolution has yet adduced, however interesting.'

At Oxford a project is on foot for the establishment of a School 'for the benefit of students who are natives of India, so that they may take the usual degrees in Arts after examination in the classical languages of their own country.' These languages are Sanscrit, Arabic, and Persian. They stand in the same relation to young Indian students as Latin and Greek to European students, and would form a real subject of examination in *literis humanioribus*. Mr Monier Williams, Professor of Sanscrit at Oxford, says of the proposed School: 'Its principal aim will be to draw England and India closer together, by promoting a reciprocity of thought and feeling between the two

countries, and a better knowledge of each other;' and he believes that it will 'partly effect this object by adapting itself to the needs of young Indians, who, as soon as an Indian School for degrees is established, will probably flock to our university.' This seems to be a project which ought to succeed.

Asiatic cholera is so well known to be such a terribly fatal disease, that any plan of treatment that gives promise of success must excite general interest. A method has lately been introduced by Surgeon-major A. R. Hall, of the Army Medical Department, which, it is hoped, will lessen the mortality caused by this fearful malady. It consists in putting *sedatives* under the skin, by means of a small syringe (hypodermic injection), instead of giving stimulants by the stomach. Surgeon-major Hall has served nearly twelve years in Bengal, and has suffered from the disease himself. In most accounts of the state of the patient in the cold stage, or collapse of cholera, the heart is described as being very weak, and the whole nervous system much exhausted. Stimulants have, therefore, almost always been administered; but experience has shewn that they do more harm than good. Surgeon-major Hall observed, in his own case, while his skin was blue and cold, and when he could not feel the pulse at his wrist, *that his heart was beating more forcibly than usual!* He therefore concluded, that the want of pulse at the wrist could not depend upon want of power in the heart. A study of the works of a distinguished physiologist, Dr Brown-Sequard, with some observations of his own, suggested the idea, that the whole nervous system is *intensely irritated*, instead of being exhausted; and that the heart and all the arteries in the body are in a state of spasmodic contraction. The muscular walls of the heart, therefore, work violently, and *squeeze* the cavities, so that the whole organ is smaller than it ought to be; but it cannot dilate as usual, and so cannot receive much blood to pump to the wrist. Surgeon-major Hall *looks upon the vomiting and purging as of secondary importance*, but directs special attention to the spasmodic condition of the heart and lungs. The frequent vomiting generally causes anything that is given by the mouth to be immediately rejected; so it occurred to him that as the nervous system appeared to want soothing instead of stimulating, powerful sedatives if put under the skin would prove beneficial. A solution of chloral hydrate (which has a very depressing action on the heart) was employed in twenty cases where the patients were either in collapse, or approaching it, and eighteen of these recovered. They were natives of Bengal. It is probable that, among Europeans, in severe cases, more powerful depressants may be required; and Surgeon-major Hall recommends the employment of solutions of Prussic acid, Calabar bean, bromide of potassium, and other true sedatives. Opium (which is not really a sedative, but a stimulating narcotic) and all alcoholic stimulants are to be avoided, and nothing given to the patient to drink, *in collapse*, except cold water, of which he may have as much as he likes. It is to be hoped that this sedative treatment may have an extended trial, and that before long we may have further favourable reports concerning it.

BENEFACTORS.

DOING good, as must be pretty well known, does not altogether consist in giving donations of money and other articles to the needy, nor in ordinary acts of kindness and sympathy. Tradition supports the idea that doing good is very much a matter of almsgiving—giving of your abundance to the poor. It scarcely recognises the principle of doing good on an extensive scale through incidental agency that is to say, without the act of giving, be the gift much or little. Modern notions of fulfilling the duties of life take a much wider sweep. It is now understood that immense good may be done without either giving or pretending to give; in fact, by benefactors squaring their own interests with the public benefit. We will offer a few examples of what we mean, that being the best way of clearing the matter up.

A wealthy man with benevolent feelings becomes acutely anxious at the beginning of winter regarding the condition of the poor of a small town in which circumstances have given him an interest. The price of coal at the spot is as much as twenty shillings a ton, and sometimes higher, for the article has to be brought a long way in carts. It is a painful consideration, how at this rate the poor are to be able to procure a sufficiency of fuel to keep themselves warm; and, troubled in his mind on the subject, the worthy individual we speak of benevolently sends a present of ten pounds to the town, for the purchasing of coal to that amount for general distribution among all who are not above receiving a dole of this nature. It is a well-meant and benevolent act, which is highly appreciated in the community, and is, of course, noted and extolled by the local newspaper.

We now come to another species of doing good. The small town in question is so ill provided with means of intercourse with places at a distance, that no wonder coal is dear and scarce at the very season of the year when it is specially required. There has been a dearth of fuel of good quality for generations. In their pinching misery, the poorer classes have barely preserved warmth in

their dwellings, with all the expedients within reach, donations included. To all appearance, this state of things is to go on for ever. The so-called benevolent do not concern themselves about it. They have relieved their feelings by charitable contribution, and otherwise leave the town to its fate. At length, among a class of persons who have never been conspicuous for making donations, there arises a desire to remedy the condition of affairs by having recourse to a feasible and plain commercial principle. They strike out the idea of a railway, to reach the nearest coal-fields and a busy centre of population. Not contenting themselves with merely talking over the matter, or drinking toasts about it, they put their hats on their respective heads, and manfully go forth to secure adherents to the undertaking. After some trouble, and encountering a variety of rebuffs, they succeed in bringing the scheme to a practical issue. The required capital is raised. The railway is made, and comes into operation. One of the first consequences which ensues is, that the price of coal drops to one half. A slower but equally effective result is the growing prosperity of the town, along with a largely increased demand for labour. The poor no longer need to depend on charitable contributions of coal. Each, from the savings of his well-recompensed labour, is able to lay in a frugal store to carry him through the winter.

It has now to be judged in which of these examples we have the highest demonstration of the art of doing good. Whether has the benevolent gentleman's annual gift of ten pounds, or the conduct of the railway projectors, produced the most benefit? One need hardly ask the question. The gift was meritorious, but it falls immeasurably short of those lasting and prodigious advantages springing out of the railway undertaking. The true benefactors were the individuals who, risking their money on a commercial enterprise, diffused innumerable blessings in what had hitherto been an outlying and almost unknown neighbourhood. Were we disposed to spend time in the recital, there would be no end to an account of similar and vastly more important acts of beneficence effected

by undertakings primarily designed as a mere money investment. Is there anything in the annals of doing good to match the expenditure of hundreds of millions in creating a network of railways in the British Islands, or in the boundless outlay of establishing ocean steamers which communicate with all the ends of the earth? Has any one seriously considered how these mechanical agencies, with the aid of accumulated capital (savings from labour), are effecting a stupendous moral revolution—everywhere breaking down narrow and unworthy prejudices, meliorating poverty, and uniting all mankind in what they ought to have been long ago, a universal and sympathising brotherhood? Thus has physical science become the powerful handmaid of religion and civilisation. Within our knowledge, there is one man who, in a pure spirit of enterprise, by his fleet of steamers, has done more to open up, and introduce modern civilisation and comforts into, the Western Islands than all the land-proprietors and all their gifts put together for the last hundred years. David Hutcheson (the name of this enterprising individual) can only be spoken of as a great public benefactor. Are there not many other men who have in a like manner signalled themselves, not in charitable doles, but as promoters of objects which immensely tend to the public benefit? The late Mr Bianconi with his cars, the precursors of railways in Ireland, familiarly occurs to recollection as one of the great benefactors of his age. In the front rank of another class of men noted for good deeds of a transcendent nature stand the names of James Watt, the inventor of the steam-engine; of George Stephenson, the improver, almost inventor, of the locomotive; and of Rowland Hill, who boldly devised the scheme of a uniform Penny Postage, with all its incalculable benefits as regards social and commercial intercourse. Wheatstone, with his invention of the electric telegraph, will also be ever renowned as a benefactor to mankind.

Legislation, considering its opportunities, does not loom largely in acts of public beneficence. The contests of party and the ventilation of crotchets too much occupy the space that might be reasonably expected to be devoted to the doing of good on a scale worth mentioning—that is to say, to the promotion of measures of any solid advantage. The truth is, legislation is fully more noted for keeping back than for advancing such measures. It is now a century since Adam Smith clearly demonstrated the advantages of free-trade, freedom in the rights of labour, and the folly of all ineconomic restrictions. Seventy years elapsed before the beneficent doctrines of that truly great man were generally recognised as sound and brought to a practical issue by legislation. In some countries, they are not recognised yet. Here is a striking example of how a boundless degree of good may be obstructed by a union of ignorance and selfishness. The significance of Smith's doctrines, as has been said by an eminent living

statesman, is not that they make a number of men rich who formerly were poor, but that their effect is 'to mitigate the labour of those who were in hard and bitter circumstances, giving comfort, and even reasonable abundance, not to scores, or hundreds, or thousands, but to millions, to whom before life was a burden.' Surely, then, Adam Smith, by his celebrated work, *The Wealth of Nations* (which every young man should make a point of studying), is to be classed among the greatest thinkers and benefactors. Considering the heroic manner in which Smith's more important economic doctrines were, in the face of determined and short-sighted opposition, brought into practical operation by Richard Cobden and Sir Robert Peel, one has a satisfaction in feeling that he was a contemporary of these eminent individuals. If free-trade had its battles with fierce and unreasoning selfishness, so had the freedom which naturally appertains to human beings. Only after enormous struggles by Wilberforce, Clarkson, and their successors, were the slave-trade and negro-slavery abolished. Middle-aged persons may have an interest in remembering the establishing of the legal principle that every man and woman was the unchallengeable proprietor of his or her own person. Looking at it in a plain point of view, that seems a very rational principle: That every man belongs to himself, and not to somebody else. Nevertheless, years and years were expended in vindicating that wonderfully simple principle. We have heard the most beautiful oratory—the outpouring of wind-bags—ingeniously shewing that slavery was a right and proper state of things. In spite of all sorts of windy and specious declamations, the right of each man to the property of his own person was triumphantly carried. Those who stood out for right against might at this memorable occasion deserve to be gratefully remembered. They were undoubtedly great men, great benefactors, who effected the meliorations we speak of. 'There were giants in those days,' and it would be befitting to emulate them wheresoever we may be directed by a sense of duty.

Doing good on a comprehensive scale, and as opportunities occur in modern society, far transcends anything pictured in the literature of past ages. Nor are there wanting many who are eager to be benefactors. In numerous instances, the prime difficulty is how to overcome obstructions presented by the lukewarm and the selfish. In the broad category of general beneficence, may be included various eminently successful schemes for supplying towns with an abundance of pure water, for introducing better kinds of sewage, and for improving cities, with a view to promoting health and lessening the rate of mortality. We could specify cases in which, by such improvements, the death-rate of a large population has been permanently reduced from twenty-nine to twenty-two per thousand. There is a clear gain of seven lives in the thousand annually. The

lives of fathers, and mothers, and children spared that would have been otherwise sacrificed. Surely that counts for something in the annals of doing good, although it is not so obvious to the eye, and not so heroic as the saving of a single life from drowning.

It is easily understood how in ancient times, in a simple organisation of society, with neither enlarged intelligence nor accumulated capital—with barely security for human life—the giving of alms was exalted to a virtue, because under an oppressive system of polity, there were numbers ever on the brink of starvation without any public provision for their succour. The Scriptures abound in the most expressive injunctions to make eleemosynary donations—'Give alms of thy goods, and never turn thy face from any poor man.' 'He that soweth little, shall reap little; and he that soweth plenteously shall reap plenteously.' 'To do good, and to distribute, forget not; for with such sacrifices God is well pleased.' 'Whoso hath this world's good, and seeing his brother have need, and shutteth up his compassion from him, how dwelleth the love of God in him?' Excellent admonitions, not to be lightly disregarded, but in the present advanced condition of society not wholly falling in with a public code of morals. As every one knows, the giving of alms only creates a host of professional mendicants. Begging becomes a trade. Old injunctions, therefore, require to be weighed in connection with the teachings of modern experience. We are called on to apply an enlarged degree of knowledge to a subject which has been studied with a substantial regard to good-doing only in recent times, and which, in those countries still in a rudimentary state, is not studied at all. In some parts of India, for example, the giving of petty alms in the ancient style flourishes with a vigour which was common throughout the East two thousand years ago. In defiance of accumulated experience, the morbidly benevolent in our own land are seen to encourage a reliance on charity, and consequently to increase pauperism. Under the notion of doing good, they get up soup-kitchens and houses of nightly refuge, which, while possibly assuaging some immediate wants, serve as 'a draw,' from the remotest parts of the kingdom; so that, by these inconsiderate attractions, a city condemns itself to a perennial supply of dissolute idlers and their unfortunate progeny.

Three hundred years ago, and even later, it was not unusual for wealthy individuals to bequeath large sums of money in trust for the endowment of hospitals for the blind and education of the young. No one will aver that these institutions have not done good in their day and generation. They supplied a want. Many of the youths they trained rose to eminence. But the general feeling now is that, as too monastic in character, they have outlived their time, and stand in need of some very special modification. Perhaps a knowledge of this fact may have induced Stewart, the 'Merchant Prince' of New York, to hesitate so long about what he should do with his wealth that he finally did nothing at all. For men of his stamp, it would be well to have some definite

notion of what really constitutes doing good by benefactions. Everything, as it appears to us, should be avoided which breaks down the sense of independence and self-respect of recipients. Obviously there is great scope for liberal benefactions, by bequest or otherwise, in promoting schools of science and art, as well as in such less technical but still important branches of education for both sexes as are not likely to be reached by ordinary appliances; also in aiding public hospitals for the sick and hurt. One of the most remarkable and gratifying demonstrations of good feeling within the past few years has been the large subscriptions and bequests for building churches, and restoring from a lamentable state of decay those ancient ecclesiastical structures which we associate with the glory of England. There is in all this a wide field for doing good, which is clearly beyond challenge.

The same thing and much more can be said of the prodigious and single-hearted efforts made to reclaim from barbaric paganism. The assaults on the savagery of Africa from all sides, along with courageous attempts to introduce Christianity, are among the marvels of the age. In this line of beneficence, merchant millionaires would be quite safe. Already, in the matter of African discovery, from Park to Livingstone, there has been a 'noble army of martyrs.' Long did the enterprise appear well-nigh hopeless. In recent events we at length see the dawn of a brighter day. Africa is in course of being opened up by different bodies of pioneers as assiduous in the cause of civilisation as any noted in history, and from the plans pursued likely to be peculiarly successful.

To come nearer home in connection with matters of social concern, there have, in attempts to do good, been some mistakes calculated to discourage intending benefactors. We are not without instances of public libraries and reading-rooms being completely thrown away on the persons for whom they were intended. Some few years ago, we took a hand in establishing what was loudly called for—baths for the working classes. The baths, after being got up on an approved principle, proved an entire failure. The people did not take advantage of them. In a city we could mention, certain Improvement Trustees spent ten thousand pounds in building houses for the poorer classes, who had been dispossessed by the removal of their dwellings. With the multitude, this was a popular act. Like the baths, it proved a miserable failure. The poor could not rent the houses, nor did they care about them, and the last thing we heard of the dwellings was that they were put up to sale. One would need to take care how he trenches on the principle of natural supply and demand. Further, it must be kept in mind that what will work well in one place may work badly in another. In other words, be sure of your man before you try to expend money in benefiting him. It is very painful to think that there are masses of people who like to live in dingy holes and corners no better than pig-sties, in preference to wholesome apartments with the light of day; but such being the case, we must act accordingly. The rooting out of what is offensive will usually be found to lead naturally enough to something better without any extraneous effort. In short, doing good on a large scale, apart from that species of commercial adventure which necessarily

develops into a lasting public benefit, is about the most difficult art that can be cultivated to any useful or satisfactory purpose. We commend the subject to professional teachers of ethics. W. C.

FALLEN FORTUNES.

CHAPTER XXXIII.—EVIL TIDINGS.

JENNY said nothing of the news she had got from Jeff, even to Kate. It was quite right of Jeff to tell her: she would have resented it, had he not done so; but it was also right in her not to tell her sister. That one of the family should know it—and be miserable accordingly—was sufficient. What Kate would have said, had she known that Jenny, the weakest of them, was bearing this burden all alone, was another matter. There had been a time when Kate had been Jeff's confidante, and not Jenny; but of late he had changed in this respect. His letters were full of Kate, as Jenny noticed with many a quiet smile, but they were not addressed to her.

'He is quite wise,' reflected the recipient of these missives, 'or that man might be tempted to open them.'

This invalid young lady was certainly rather strong in her likes and dislikes. She thought Uncle George 'an old dear,' and the doctor 'perfection'; but she had no hesitation in pronouncing (to herself of course) Mrs Campden as 'base'; Mary, as 'weak' and 'undependable'; and Mr Holt as 'a horror.' She would never forgive his having aspired to her sister's hand, or Mrs Campden for 'egging him on' to do it (as she guessed), under pretence, too, of its being for the benefit of the family, and especially of herself. She even suspected Holt of being the cause of her father's ruin.

A fortnight had passed by since she had been told that there was 'no cause for anxiety as yet'; and she could see that her mother was growing very anxious. In default of letters, Mrs Dalton read the newspaper every morning with avidity—that is, the two half-columns of it which referred to 'Shipping Intelligence' and 'the Mails.' This paper, which arrived at Riverside in the afternoon, was forwarded to them by post next day with commendable regularity.

'It is so kind of Julia,' said Mrs Dalton, speaking of this to the doctor, 'and so thoughtful.'

'Yes,' added Jenny drily, 'and so troublesome. Marks [the butler] directs it himself, and puts it in the bag.'

One morning, the *Morning Chronicle* came instead of the *Times*, which the girls could see had quite a depressing effect upon their mother. The reports about the shipping, she complained, were not so full.

'Never mind, mamma,' said Kitty: 'Tony shall go over the hill after dinner, and fetch the *Times*, and take a line from Jenny to Marks to tell him to be more careful in future: the old fellow is devoted to her interests.'

But before Tony's lessons were over, Mr Campden himself arrived on horseback; he had come once or twice before, but always hitherto with his wife or daughter.

'This is a great compliment, Mr Campden,' said Mrs Dalton gratefully, 'that you should come riding over in this way, when we know you hate riding.'

'I hope I should ride much farther than this, or walk either, my dear, to oblige you,' was the reply, given with unusual earnestness. He had never called her 'my dear' before.

'I always thought you were a duck, Uncle George,' said Kate.

'I always said you were,' said Jenny; 'I had the courage of my opinion.'

'What is it you want of me, girls?' inquired Mr Campden, but his voice was mechanical, and unaccompanied by the usual sly smile.

'Well, I want the *Times* newspaper,' said Mrs Dalton. 'I frankly tell you, Uncle George, I hoped you were come to repair a mistake that was made this morning: the *Morning Chronicle* was sent instead.'

'Dear me!' said Mr Campden: 'how stupid of them. The fact is, we have such a lot of papers, and they get laid about so. But it shall not happen again.'

'There was nothing in the *Times* about—about Brazil or the Rio mail, Uncle George, was there?' inquired Mrs Dalton.

'Nothing, nothing, my dear,' answered Mr Campden, turning very red. 'I'm going up to the mere, to see about some damage that has happened to the keeper's cottage from the wind.'

'Ay,' said Mrs Dalton with a shudder, 'what winds there have been lately!'

'They have been partial, however very partial,' continued Mr Campden: 'nothing seems to have suffered in the south.—What do you say to a little walk to the lake-side, Kate? If you will be my companion, I will put up the mare here, and go on foot.'

To this Kate gladly agreed; and Tony looked up eagerly from his book with: 'May I come too, Uncle George?'

'Well, no, my boy,' returned Mr Campden gravely: 'it would be an interruption to your lessons; and just now it is expedient that you should buckle to.'

A faint flush came into Mrs Dalton's face; it was the first time that Mr Campden had alluded—even thus indirectly—to the changed circumstances of the family.

'That is quite right,' said she quietly. 'But you can go down for a minute, Tony, and see that Uncle George's horse is put in the stable, and some corn given to it.'

'Oh, never mind the corn,' said Mr Campden hastily; and then he got so red again, that Jenny became red too, from sheer sympathy with his embarrassment. Fortunately, at that moment, Kitty, who had left the room, re-entered it, equipped for her walk, giving the squire an opportunity of complimenting her upon the rapidity of her toilet, and after a few commonplaces, they took their departure.

Over the bridge and past the churchyard, they walked in silence, or only returned the greetings of the villagers; but as soon as they got clear of the hamlet, Mr Campden addressed his companion with an unaccustomed tenderness and gravity.

'Kitty, my dear, you are a brave girl, I know; but I have got something to tell you that will try your courage.'

'Not about papa, Uncle George?' cried she with sudden vehemence. 'Oh, don't say there is bad news about papa!'

'Well, my darling, it may not be bad news

at all; there may be really nothing in it; but it does concern your father.'

She did not answer, but he felt the arm within his own grow very heavy.

'That is right, dear; lean on me: whatever happens, lean on me,' said Uncle George encouragingly. 'You see, although there may have been many causes to retard the ship in which your father sailed, the prevalent wind has been against it, for one thing, and the wind makes a difference even to a steamer. It is without doubt overtime. That circumstance gives us anxiety, of course, and causes us to feel alarm, where perhaps there is no reason for alarm.'

'Yes, yes. But what has happened, Uncle George? I am sure something has happened.'

'No, no; we are not sure of that, thank goodness. We can still hope for the best. But a vessel has come into Liverpool that has fallen in with a lot of wreck—not of the ship, not of the ship, Kitty. Here; sit down on the hill-side.—(Good gracious, she will catch her death of cold,' cried Mr Campden helplessly. 'What the deuce shall I do with her?' added the squire privately, who was one of the clumsiest, as well as the most amiable of men.)

'Never mind me—I am better now,' said Kitty slowly. 'You said it was not the wreck of the ship?'

'Nor was it, my dear girl. It was only a bit of a boat belonging to the ship; the cutter, I think, they call it. You have seen how boats are swung upon deck, and how easy it must be for a big wave to sweep them off into the sea. That is what has probably happened in this case. The ship has lost a boat or two—that's all.'

'But how did they know the cutter belonged to papa's ship?'

'Because it had *Flamborough Head* painted on the stern. There may be nothing in it; but that's why we didn't send the paper that had the paragraph in it on to the Nook.'

'How good and thoughtful you are for us, Uncle George!' said Kitty, who had risen to her feet, and was now walking slowly on.

'Well, we must not put that item down to our own credit, Kitty. We might have taken the precaution or not. Perhaps we should have done so, had the paragraph caught our eyes; but it might have escaped them. I am bound to say I think it was very considerate in Mr Holt to telegraph and draw our attention to it. "Send on the *Chronicle* to Sanbeck," he wired; "the bad news is not in that." He is a sharp fellow, there is no doubt; and I begin to think he is a kind fellow.'

'It was very kind of him to telegraph,' answered Kitty in a low tone.

'Yes. Not one man in a thousand, as my wife says, would have thought of such a thing; and it shews the very strong interest he takes in you all. I don't think your father gave him quite credit for a good heart.'

Kitty did not reply to this; and they walked on in silence for a while.

'I think, my dear, you are beginning to tire,' said Mr Campden presently; 'it is ill walking upon bad news.'

'But we are not at the mere yet, Uncle George.'

'Oh, never mind the mere,' answered the other, turning about towards home; 'that was only my

excuse for getting a walk with you alone. I thought it right that one member of your family at least should know what had happened.'

'And when shall we know more, Uncle George?'

'That is impossible to say, my dear. I hope the next Brazil mail may bring good tidings. Otherwise—otherwise, there will, no doubt, be grave cause for anxiety. You must try and hide your feelings from your mother, Kitty dear.'

'(O yes, Uncle George; nobody shall see that I have her—her—heard anything; and she made a strenuous effort—which almost succeeded—to stifle a sob.

'Yes, yes; you are a brave girl, and a clever one too. Now, as for me, I can never hide anything from Julia—I wish to heaven I could, sometimes! And just now, in your dear mother's presence, I felt like—I don't know what—a disconcerted pick-pocket. It was the worst job I have had to do for many a day. She seemed to look through and through me, poor dear; as much as to say: "How can you deceive me, and keep things back like this, Uncle George?" I can't see her again, Kitty; I dare not. But if there is good news to bring, I'll bring it to her, at the best pace the mare can go. You must make some excuse for me to your mother: say my wife insisted on my being back to lunch then she will understand I had to go.'

Poor Uncle George: his distress and embarrassment were so extreme that he was ready to part with this last rag of independence, even before society, with whom he had hitherto kept up some fiction of his being responsible for his own actions.

Kitty let him go, of course; and as he got on his horse at the old 'mounting-stone' in the Nook yard (within view of them all, as she knew), shook hands with him gaily, and waved her handkerchief as he rode out under the archway. Then, putting on as cheerful a face as she could assume, she entered the house. On the narrow and ill-lit stairs, stood Jenny with her finger on her lips, as pale as a ghost. 'Come into my room,' she whispered; 'mamma is tired, and has fallen asleep on the sofa; and Tony is at his sums.'

Kitty followed her, alarmed for her secret; her sister's eyes seemed to pierce her.

Jenny's room was a pleasant one in its way, though like others at the farm-house, low and dark. Books were on the table, the floor, the chairs, and even the little bed; her old desk was heaped with them; reading and writing had elbowed out the lacemaking, which, however, she still pursued in the parlour. 'What news, Kitty? I am sure there is bad news; were her first words as she closed the door.

'No—nothing,' faltered Kitty.

'Don't deceive me, Kate; I mean, don't try at it. Do you suppose I am blind? Uncle George did not come here for nothing. Who ever saw him like that before, so nervous and ill at ease. Was it like him to tell Tony to remain within doors? Of course he had something private to tell you; some misfortune—something about papa.'

Kitty burst into tears. 'Yes, Jenny, he had.' Then, as well as she could, she told her. She had wept but little before Mr Campden; sympathy of the passionate sort was wanting between them, and she had a reputation for courage to keep up; but now she broke down utterly.

'Hush!' said Jenny warningly; 'mamma will hear you.' Her voice was firm, her eyes were

tearless. Kitty thought she must have some hope.

'You think with Uncle George, dear, that the boat must have been washed overboard,' said she eagerly—'that nothing has happened to the ship itself?'

'No, I don't,' was the cold reply.

'But you don't think the steamer has gone down, Jenny?' continued her sister pleadingly; 'things will not surely be so bad as that.'

'My thinking will not alter them, Kitty. They have been bad enough hitherto. One thing I confess I am surprised at, that Mr Campden should have had the forethought to keep back the *Times*; that was a piece of prudence beyond Uncle George, and an act of tenderness (as I should have thought) beyond his wife.'

'It was Mr Holt's doing, Jenny,' said Kitty. 'He telegraphed to Riverside, to put them on their guard about the paragraph.'

'O indeed; that explains the matter.'

'It was very thoughtful of Mr Holt—was it not, Jenny?'

'Certainly. But no one ever accused him of want of forethought. He is a man who lays his plans very far ahead, I reckon.'

'Jenny, darling, what makes you so hard? Surely, at a time like this'—

'Hard? I am not hard,' broke in the other. 'It is you, Kitty, who are too soft. Do you suppose that this man cares one farthing about dear papa or mamma, or even about *you*, except so far as you concern himself? Do you suppose he took Jeff because he liked him, or out of charity, or from any good motive of any kind? No. He did it because he hoped to melt your heart towards himself; in hopes that you would say: "How thoughtful and kind Mr Holt is!" Just what you have said, in fact.'

'O Jenny, how can you talk of Mr Holt now, with such sad news knelling in our ears!'

'That is the very thing that makes me so bitter against him. At the first tidings of danger to dear papa, this man puts himself forward, presses himself upon your attention. He knows Mrs Campden is backing him.'

'And yet, if he had not telegraphed, Jenny; and the *Times* had come, and mamma had read the paragraph'—

'True; it would have killed her.—Pardon me, Kitty,' said Jenny, throwing her arms about her sister's neck; 'I have been unjust and harsh. One has no right to disbelieve in good, for that means in God. Perhaps it is all for the best, but we have been greatly tried of late; and we are feeble folk like the conies—a few women and a child. It has seemed hard to me, that's all: I have known about papa for weeks; that is, that the ship has been spoken of as Lloyd's as overdue. Jeff wrote to say so.'

'O Jenny, how could you keep such a dreadful secret to yourself?'

'Because it was needful, Kitty, as it is needful now to keep this one. I believe that mamma suspects something even now. She was no more deceived by Uncle George than I was.'

'But, Jenny, if she asks me!'

'She will ask nothing. She will be as dumb as an Indian at the stake. She will know that we have good reasons for being silent; and that will be enough for her. She is a saint and a martyr;

and yet not a martyr for any purpose. I mean, "unmerciful disaster" pursues her "fast and ever faster," without any reason, except it be to shew the futility of being good.'

'O Jenny, don't say that. The ways of Providence are inscrutable.'

'I think I have heard that remark before. For my part, Kitty, I derive no comfort from such commonplaces. You will presently tell me that we may be even worse off than we are. Mamma may die, for example, as well as papa be drowned. Then you will say, like the Job's comforters of whom the poet speaks, that

Death is common to the race.

His reply was, if you remember:

And common is the commonplace,
And vacant chaff well meant for grain.

I confess that I agree with him.'

'O Jenny, do not be so bitter. I am sure, I am quite sure, that if dear mamma knew it, it would distress her almost as much as this sad news to-day.'

'You are quite right, Kitty; that is, because she is an angel. Yet only think what she has suffered! Is Fate a coward, think you, that it should thus heap blow on blow on one like her, so helpless and so innocent; or how is it?'

'The riddle of the painful earth' was growing too much for this poor girl, as it does grow once or twice in a lifetime for most of us; and for some, alas! all their hard lives through. Her thin hand was clenched, her frail frame trembled, her large soft eyes flashed defiance—at the Universal Law. There was one thing excusable about this poor impotent mutineer—that she was not in rebellion on her own account. No one had ever heard her, cripple and invalid though she was, utter one impatient word with respect to her own condition. These bitter reproaches against Fate—the *sera indignatio* that Swift felt upon his own account, and would have had sculptured on his tombstone—were all for her mother's sake; she reviled the Inevitable, as the hen flutters her feathers in the face of the cruel fox because her young—not herself—are menaced.

Mrs Campden used to say of Jenny that she had an undisciplined mind: one of those severe but sagacious remarks that even the shallowest people will bring forth sometimes, who are always talking, and always with the view of making themselves more or less disagreeable.

Kate herself, as we heard upon the occasion of our first introduction to her, was by no means one who had accepted life without question, or concluded it easy-going for everybody, because the way had been always, until recently, made smooth for her; but Jenny's revolt was so decided, that it shocked her into propriety of opinion, as a respectable Whig, finding himself in Radical company, will shake his head, turn short round, and retrace his steps. In argument, she knew her sister was too strong for her, so she wisely avoided it.

'My dear Jenny, all these things are too difficult for me,' said she frankly. 'Of course, I am well aware that dear mamma does not deserve to suffer; for if she does, who on earth would escape suffering, as certainly some folks do! Perhaps she suffers—as she does everything else—for the sake of other people: of you and me, for instance. In the end,

she will be among the blessed for ever, but in the meantime she is martyred for our sake; being a lesson to us of obedience and submission to the will of God such as we should never learn elsewhere. One may say, if this be so, it must be cruel to wish her to remain with us; and yet we are both so selfish, that we cannot bear to think of parting with so sweet a teacher.'

'That is true, at all events,' said Jenny softly. 'I will go to her now, lest our absence should excite her suspicions. I shall say that I have seen you, and that Uncle George is gone. Kiss me, Kitty.'

The two sisters embraced tenderly; they had never had the quarrels that sisters do; thanks, perhaps, to Jenny's condition.

If Fate was resolute to be hard upon them, it would at least find them united.

MISTAKEN IDEAS OF INDIA.

THE writer of this is what is known as an 'Old Indian,' and like many others of his class, has a very tender regard for the country in which many of the best years of his life were spent. He cannot forget the happy friendships he formed there, the social enjoyments in which he participated, the exciting pleasures of the chase, and other sports in which he indulged, and last, but not least, the many kindnesses he experienced at the hands of the natives. It will not be wondered at, then, that he is often very much amused, and occasionally somewhat put out, while listening to the disquisitions which arise in social gatherings, particularly among the ladies, regarding his old country.

Lamentable to say, he often hears it spoken of as a dreadful region, in which at every turn, by day as well as by night, both indoors and out, in the quiet security of the cantonment, as well as in the densely wooded forest, one is constantly exposed to some covert danger, which nought but constant vigilance and precaution can guard him against. The writer has often endeavoured to disabuse the minds of people who entertain erroneous notions of a country which he holds dear. He has mildly expostulated, and tried to convince them that some war had been amusing himself at their expense by playing upon their credulity; but to no purpose. Meanwhile, he is determined to make an effort to place on record a reply, not only to the present generation of detractors, but one that may serve for others who may feel inclined, in the future, to perpetuate the calumny.

In undertaking this onerous task, he feels that his only chance of success lies in giving authentic instances, which will serve as proofs that the charges brought against the country, in which he was for many years an exile, are of a doubtful character; and to begin, he will give an instance of devotion, involving self-sacrifice on the part of an Indian attendant, which equals if it does not surpass many cases of the kind on record.

The attendant whose devotion he would record was called Vittu. He was a man of caste, and had been in the writer's service for fifteen years. He was attacked with cholera early one morning, and died during the afternoon of the same day. The writer became aware of his illness at about 10 A.M., and from that time, in the absence of a doctor, did

all in his power to save his old and tried servant; but in vain. The fell disease progressed with rapid strides, and finished its work in spite of every effort to arrest it. When Vittu was gone, the writer asked his butler how it was that he had not been made sooner acquainted with the poor fellow's illness. Mark the reply. 'Vittu warned us particularly not to say anything to you about his being attacked, till you had breakfasted, for fear that you would get alarmed and not eat anything.' The writer had gone out early in the morning, but returned home about 8.30 A.M., and thus fully an hour and a half was lost before any remedies were resorted to. And why? Because the stricken man would not have his master upset, so as not to be able to eat his breakfast. Vittu was aware of the risk he was running, for he had been a witness of many deaths from cholera; but he also knew that his master dreaded the dire scourge; and he would rather sacrifice himself than alarm him at an untimely hour. Instances of the devotion of native servants might be multiplied; but let this suffice. The writer would merely add, let us hear no more of the treacherous Indians. Treat the natives of India kindly, and they will be found equal to any race in gratitude and fidelity.

The allusion to cholera leads to a consideration of the climate of India. The worst that can be said against it is, that it does not in all cases agree with the constitution of Englishmen. But to condemn it for this reason, would be to say that because the English climate does not suit the natives of India, it also is a bad one. But the question to be settled is, whether or not the climate of India is as bad as it is made out to be. Many people judge of it from the numbers of our countrymen who return from India with shattered constitutions; but if the history of each of these broken-down men with enlarged livers were known, it would be found that it was not so much the climate of India, as imprudent habits, which had undermined their health, and reduced them to the infirm state in which they have returned home. Ruined health is chiefly due to a too free indulgence in intoxicating beverages, and heedless exposure to the rays of the sun; and if to these be added late hours and a recklessness as to the mode of living most suitable to India, we should find little left for the climate to account for. Though undoubtedly there are cases of home-sickness such as that of the artisan whose daily life we lately described in these pages, still there are few men who have led temperate lives, and have been careful as to exposure to the sun, who return home the worse for the climate of India; many indeed who, on retiring from the public service or from business in India, elect to spend the remainder of their days there, in preference to returning to England. Why is this? Because they see that numbers of their countrymen, who have made the same choice before them, have lived to a great age in India, and they would much rather not expose themselves to the chance of being attacked by a host of diseases peculiar to England, from which they have nothing to fear in that country. The writer himself resided for thirty-five years in India, and lived under canvas for fully half the time, exposed to every vicissitude of weather; notwithstanding, he has a very vague idea of dyspepsia, and is not at all aware that he possesses a liver.

He will now pass on, and say something of the dreadful animals which are supposed to endanger life in India. The native idea is, that all wild animals have a wholesome dread of man inherent in them; and that even the tiger will not molest a human being, unless he is at first attacked himself. The writer is inclined to attach much importance to this assumption, based as it is on the personal experience of the natives. They tell you that wild animals slink out of their way when met in the jungles; and the following incident, which may be fully relied on, shews that even the tiger is chary of gratifying his voracious propensity at the expense of a human being.

Nearly half a century ago, a Captain J— of the Bombay Engineers was travelling along the western mountain range, then covered with dense forests, and infested with tigers, leopards, bears, and other wild animals. He had retired to rest one night, and was all but asleep, when hearing a rustling in his tent, he stretched out his arm, to get hold of a cane he knew stood against the tent-wall close by. In doing so, his hand struck against a tiger, which had somehow found its way into the tent. On being touched, the animal uttered a deep growl; and J—, fairly aroused, became aware of the nature of his unwelcome visitor. He was seriously alarmed, but wisely remained perfectly still; and the brute after a little time quietly left the tent, and was seen walking leisurely away, by men who were posted in the vicinity to keep watch during the night. They commenced shouting at the animal, which merely quickened its pace at the noise, and disappeared in the jungle close by. Here was a chance for the tiger; but if the truth were known, it would very likely be seen that it was as much terrified as J—, and lay crouching in the dark until it thought it could escape with safety.

Another idea the natives have regarding the nature of the tiger is, that once the animal has tasted human blood, it will, in preference to devouring cattle, seize any man it can get hold of. The idea is beside the question at issue; but as the following remarkable incident, illustrative of it, which fell under the writer's notice, may prove interesting to the reader, he ventures to narrate it. It happened just after the Mutiny of 1857, when the people had been disarmed, and were unable to defend their cattle from wild beasts. How the tiger to which the story relates had acquired a taste for human blood, was never cleared up; but so great was his partiality for it, that he would rush among a herd of cattle and carry off the keeper, leaving the cattle unmolested. Such was the daring of the brute, that one night he entered a hut, in the outskirts of a village, which was occupied by a man, his wife, and child. He first seized the child, and was carrying it off, when the mother rushed after him with a hatchet; the tiger dropped the child, and seized the woman, whom, in turn, he also dropped on seeing the man pursuing him. The woman was too much injured to continue pursuit, but succeeded by her screams in arousing some of the villagers. When they came to her aid, pursuit was useless, for the brute had got clear away. The remains of the man were found next day; the woman died a few days afterwards; but the child, which was not very much injured, survived. The tiger was killed a short time subsequently, by a native

Shikari (hunter), who had obtained a license to keep firearms. It is believed that the consequence of eating human flesh, to the tiger, is an attack of mange; and there appears some truth in the notion, for this animal was covered with mange, particularly its tail, which was one mass of scabs and without a hair.

Whether or not tigers and other such wild animals, under ordinary circumstances, will not, except in self-defence, attack men, there is no doubt that the snakes of India will not do so. The writer has seen great numbers of them in his time, but he never heard of one attacking a man. In short, they invariably rush off at his approach; and so long as he avoids treading on, or otherwise hurting them, he is quite safe. Their principal food consists of frogs, rats, and mice; and if they enter a house, it is rather in search of these animals than to injure the inmates. The following instance will shew how little danger is to be apprehended from snakes.

Some twenty years ago, a Mr F— was travelling during the rainy season, and arrived rather late at a staging, or travellers' bungalow, where he intended to remain for the night. He found, on his arrival, that every room was already occupied by travellers; and he was obliged, therefore, to remain in the veranda for the night. After partaking of some refreshment, he spread a small carpet on the floor, converted his saddle into a pillow, and lying down, soon fell off to sleep. It rained all night, and towards morning he was aroused by a cold wind which had set in. He lay awake for a time, moving from side to side, and suddenly felt something move under the carpet near his head. As it was still dark, he groped to see what it might be, and to his horror, discovered from its smooth scaly skin, that it was a snake. He jumped up and procured a light, just in time to see the snake rush out of the veranda. It had come to seek shelter from the pouring rain and cold, and was glad, no doubt, of the opportunity of warming itself under Mr F—'s carpet. It certainly had no idea of molesting him.

The animals which remain to be spoken of, from which it is just possible that some danger may be apprehended, are, the bear, the bison, the elephant, and the wolf; but the chances of danger from these are so remote, that the mere mention of their names seems all that is necessary. The carnivorous wolf would, of course, be glad of a bite of human flesh; but he is too great a coward to attempt to attack a man; and even when he is himself attacked, as long as there is any way of escape, he will rather run away than shew fight. As to the rest, if the right of way in the forest is disputed, bruin may give one an ugly hug; bright colours may provoke a charge from a bison; and an elephant may revenge himself on one man for the insult offered by another; but if these animals are not molested, they will not go out of their way to take upon themselves the offensive.

Having dismissed those dreadful denizens of the forest, from which, under certain circumstances, the life of man is endangered, a few words may be said of those smaller animals, of an objectionable nature, which either live in the neighbourhood of man or share his dwelling.

Among these may be mentioned the scorpion, the mosquito, the frog, and the house-lizard. The scorpion is the only one from which any great

inconvenience may be apprehended. Its sting, particularly in the case of a black scorpion, causes much pain, accompanied with swelling, which sometimes continues for a day or two; but as the scorpion seldom enters the houses of Europeans, there is not much fear of their being stung by it. In short, the writer does not remember a single instance of a European suffering from the sting of a scorpion. He has, however, known several cases of natives being stung by this animal; but when it is considered that the thatched huts of the natives afford peculiar facilities for animals of this kind to secrete themselves, and that the poorer natives go about night and day without shoes, the wonder is that they are not oftener stung by scorpions.

The mosquito is very like unto, if not identical with the gnat of England, which is common in summer; and the reader will therefore have no difficulty in forming a correct idea of the nature of this much-dreaded insect. Mosquitoes are, it is true, much more numerous in India than gnats in England, and therefore the inconvenience arising from them is proportionally greater; but at the worst, inconvenience is all that need be apprehended from them—danger there is none. All the precautions the poorer natives use to guard themselves from the attack of the mosquito is, when lying down for the night, to envelop themselves from head to foot in either a coarse blanket or thin sheet, according to the season of the year. As a matter of course, this does not secure impunity from the enemy; but it shews what little importance the natives attach to the bite of the mosquito. A good rub and a grunt are the only indications the sleeping victim shews of the infliction he has undergone. Europeans who can afford them, have net or gauze curtains to their bedsteads, which effectually keep out these little tyrants, and all that has to be done to secure a quiet night's rest is, on getting under the curtains, to make certain that no stray member of the mosquito community has found a lodgment within them.

Frogs are perfectly harmless, and seldom intrude into houses, except for shelter during the hotter season of the year. They may then be seen in bath-rooms or such places, crouched under earthen pots or other vessels containing water. If it were not that they prove a strong temptation to snakes to come into the houses in search of them, there could be little objection to a frog or two taking shelter from the heat in those parts of the house visited but once or twice during the twenty-four hours.

The house-lizard, or fly-catcher as it is sometimes called, is not a nice animal to see about the house, and some ladies, from its look, have a perfect horror of it. However, it also is quite harmless, so far as the genus *homo* is concerned; and its preference for his dwelling to the open air, arises simply from the fact that it lives on flies and mosquitoes, and these are found in greater abundance within houses than anywhere else.

And now the writer trusts he has dispelled some of the idle fears with which India is connected in the minds of many who have not been there to judge for themselves, and whose confiding credulity has been practised upon, for the sake of amusement, by those who have. He does not object to a little fun in its proper place, but he certainly objects to a mosquito being turned into an ele-

phant, and a house-lizard into an embryo crocodile, particularly if the transformation is intended to cast a slur upon a country of which he is known as an indubitable champion.

DASHMARTON'S LEGACY.

CHAPTER I.

IF the county of — be the warmest, sunniest county in England—as its inhabitants pretend—it may be safely affirmed that there is no warmer, sunnier spot than Mordieu within its compass. The house of Mordieu is an old-fashioned red brick and tiled house, which has been added to here and there; here a substantial wing put on, there a bow-window thrown out. The front of it is covered with ivy and creepers, out of which the cheerful windows twinkle and blink in the sunshine; and from early spring to Christmas-tide almost, the hum of bees and twittering of song-birds never cease about its walls. Then it has a fine old-fashioned walled garden, where rich peaches, and luscious nectarines, and sunny apricots grow and ripen in their seasons. Add to this that it is infolded and sheltered by a group of noble trees, of varied, well-contrasted foliage; that you have a charming lawn, surrounded by gay flower-beds, and rose-trees running riot in profusion, backed with flowering shrubs, such as the nurserymen of Woking and Bagshot may envy, and you will admit that Mordieu has about it the elements of a pleasant tranquil retreat. But add another element. Let it be known that the house whose outward shell we have described is happy in the presence of fair and graceful womanhood, and the place assumes a brighter, warmer interest, Mordieu is very well in its way, but Lucy Dashmarton, who lives there, is far more worthy of our respectful admiration.

John Dashmarton, her father, is the owner of Mordieu and the farm of the same name; a tall, good-humoured, but passionate, prideful man, with healthy, ruddy cheeks, a fine aquiline nose, and a frank, impetuous bearing. He is not only the owner of Mordieu, but also the agent to the Chilprune estate, a position that gives him commanding influence in the neighbourhood; for far and wide, stretching for miles around, this great estate of the Chilprunes has swallowed up and digested all the minor properties that came within its folds. It is in the hands of trustees now, for the benefit of the little Lady Chilprune, a child some five years old; and these trustees appear upon the scene at rare and uncertain intervals, so that nobody in the neighbourhood knows much about them. John Dashmarton is the virtual ruler of the estate; and if you asked any of the smaller tenants who was their landlord, the reply would be, in nine cases out of ten, 'Mas'r John Dashmarton.'

John had long been a widower; and for several years—ever since she left school—his daughter Lucy had ruled over his house. She was now nearly two-and-twenty, with a dark winning, almost Irish face; a neat, well-developed figure, rather under than over the middle height; a pleasant, caressing manner for those whom she liked, and a good deal of dignity and promptitude for the rest of the world. Nature and the position she held had given her a good conceit of herself; indeed, she

could hardly have been John Dashmorton's daughter without a fair share of that quality; but it was tempered by an affectionate disposition and generous, kindly impulses.

There was a brother, Spiller, a year younger than his sister, who was now an undergraduate at Cambridge. In him the family trait, of a somewhat inordinate self-opinion, had developed in the kindly soil of the university, till it had almost choked and superseded any other qualities he might have originally possessed. With his budget of current slang, his wardrobe of the choicest Cambridge cut, his handsome expressionless face, his overweening assurance, and his measureless contempt for everything outside his own small clique, he was an object of wonder and aversion to the disinterested observer; but it must be admitted that he was popular enough with the ladies of his acquaintance, and was dearly loved by his sister Lucy.

It is a letter from her brother Spiller—and not a love-letter, as you might have guessed from the breathless attention she gives it, and the heightened colour that glows in her cheeks—that Lucy Dashmorton is reading at the breakfast-table in the parlour at Mordieu this fine October morning. She is alone, for her father breakfasted a couple of hours ago, and was away with his gun and dogs before Lucy came down. The parlour is warm and sunny, and the windows were wide open down to the lawn; a pleasant breeze steals in with the rustle and murmur of leaves and the hum of bees, and, it must be added, of wasps also, from the neighbouring grape-vine. Nothing in this world is perfect; and Lucy's appreciation of the balmy morning, of breakfast, for which she has an excellent appetite, and of her brother's letter, is somewhat marred by the occasional incursions of these little warlike and aggressive insects. They have begun to crawl now too, and thus to render themselves particularly dangerous to the petticoated sex. Lucy is not brave against physical dangers, and is a good deal worried in her mind about the wasps. Still, her brother's letter seems to be an important one, and claims her thoughtful consideration. One passage she reads over and over again.

'I have fancied,' wrote Spiller, 'from your mentioning Alfred Harvey's name several times in your last letter, and from what I observed in his manner when I was last at Mordieu, that he is not unlikely buoying himself up with the hope of making himself agreeable to you. Now, I hope you will at once and firmly stamp out any idea of the kind he may have conceived. Of course, I don't allude to the possibility of your thinking seriously of his attentions. I know very well that you have too much family pride, too much consideration for my interests, to dream of an alliance so compromising. Such a man I could not possibly introduce to any of my friends. He would be set down at once as a common cad. Now, Tresilian Whitwick—although I think you might look much higher—is still in every way unexceptionable.'

But Spiller seemed to have overshot the mark a little. 'A common cad,' she repeated to herself more than once. 'No; he is not that, Spiller. And considering how kind and hospitable he always is to you, it is not grateful of you to say so.' Spiller, had he been present, would have rejoined, that he had said nothing of the kind, that he had only set forth what opinion his friends would

have. But Lucy's common-sense would have at once ignored such a nice distinction.

'Well, he is gone now,' said Lucy, with a sigh—'gone away for six months, perhaps; and in that time what may happen? I dare say he will bring a wife home from America—the girls there are very fascinating, they say; and as Alfred has plenty of money, they are not likely to be so fastidious as Spiller would have me be.'

Alfred Harvey was one of the principal tenants on the Chilprune estate—the son of a wealthy shopkeeper in the chief town of the county. He was a farmer of the modern school, with plenty of capital, a farm well stocked, and furnished with all the latest mechanical appliances. A man with an ugly, good-tempered face, a great brown beard, and a manner somewhat brusque and rough. He had been a good deal at the Dashmortons' lately, for John liked his company, although he sneered at him sometimes behind his back. He had shewn his admiration for Lucy pretty plainly, and a very little encouragement from her would have brought him to declaration point. But that encouragement she would not give. She liked him well enough, but she had pictured to herself a very different type of man as the ideal husband; and then to marry him would be to a certain extent a decline in the social scale. The Whitwicks would not visit her, nor the Mainprices, nor the Leystones, nor any of the good families of the neighbourhood with whom they were now on friendly terms.

And then, what was worse than all, Alfred had a very objectionable father and mother.

They had been on a visit at their son's house, not long ago, and Lucy half-suspected, with the object of 'taking stock,' as Harvey *pere* would have expressed it, of Lucy herself. Alfred had persuaded Lucy and her father to meet them at a picnic which he gave at an old castle near by; but the thing was a failure. John and Mr Harvey quarrelled desperately more than once; whilst Lucy and the mother had not an idea in common, and grew wofully tired of each other ere the day was out, Mrs Harvey being one of those plain-spoken women who seem to have an instinctive knowledge of everybody's tender corn, and to delight in trampling on it.

After that, the father and the mother both set their faces resolutely against any alliance with the Dashmortons. Mr Harvey had no doubt kept a tight hand over his son in the way of the capital he had advanced him, and what he said went for a long way. Still, if Alfred persevered, there was no doubt his father would give in at last; and somewhat fearing this, the elder proposed to his son to take a tour in America for three months or so after harvest, to see what they were doing over there in agriculture and implements—the father to pay all expenses. This might be the means, Mr Harvey hoped, of weaning his son's affections from the girl at Mordieu, by shewing him how many other pretty girls there were in the world, and that a man with his pockets well lined need not bate his countenance before any one.

Well, Alfred was gone; he had started for Liverpool the night before, and was to sail this very day. But the last house he had visited had been Mordieu, and the last adieu he had made had been to Lucy Dashmorton.

'I shall take no one's hand in mine after this, on this side of the water,' said Alfred, in parting,

giving her a long and tender clasp; 'and when I come back I hope it will be the first to greet me.' Alfred's eyes were all of a swim, and he might have blurted forth a declaration of his love, then and there, but at this moment John Dashmarton came out, and took him by the arm. 'Come along, Harvey,' he said; 'I have got a word or two to say to you about what we were talking of just now' (Alfred had been closeted with Dashmarton in his business-room for some time); 'give me a lift as far as Ashleyhurst.'

And then the dogcart had dashed away from the gate, and she had seen no more of him. Well, if the declaration that had trembled on his lips had been made, she would have refused him point-blank. She felt sure of that. And on the whole she was glad that he had not asked her. She had now three or four months to think about the matter, and test her feelings for Alfred, and of course she could not do that effectually without flirting a little with somebody else.

Breakfast was over and luncheon, and still John Dashmarton had not returned. Lucy was not surprised at this, although she wondered a little that her father had not sent home for refreshment, as he was not given to long fasting. But perhaps he had gone further afield than he originally intended, and had claimed hospitality at some farmhouse. He would bring home a good bag of game, no doubt, and it would come in handy at this present time, for Lucy meditated a little dinner-party. She could give a dinner-party now with a mind free from anxiety, lest Alfred should resent being left out, or the other guests should be offended at being asked to meet him. Lucy had donned a pretty afternoon costume, and now sat down in the drawing-room by the open window to make a list of the guests whom she would invite, and draw a rough sketch of the dinner she would give them. The bustle of an arrival, however, soon disturbed her; a carriage—the Whitwicks'—drove up to the door. Lucy ran to the pier-glass in a little trepidation, to see if her hair was all right, and ready to receive visitors; and then she snatched up her company bit of Berlin-wool work, and began to stitch artlessly and originally.

'My dear Lucy!' said Mrs Whitwick, a stout portly dame, who delighted in black velvet and sparkling heads of jet. 'Always busy, you indefatigable girl. Now, whom may this charming piece of work be meant for? A curate, according to the books. Well, here is a curate for you.—Tresilian, come forward. —I brought Tresilian; poor boy, he was so anxious to see you.—Now, Tresilian, would not a piece of work like this reconcile you to a curacy?'

Tresilian was a mild-looking but rather pompous young man, with his mother's somewhat massive face, but without the strong determined will that shone in hers. He was of Oxford, and had taken orders in compliance with his mother's wish; rather to keep him out of mischief, and under her maternal wing, than that she thought him peculiarly qualified for the profession.

'Yes,' went on Mrs Whitwick, as soon as Tresilian had greeted Lucy, and they were all settled; 'I think poor Tresilian has made up his mind to take a curacy. It is a great trial for us all, but we think it for the best, especially as we have met with such a charming opening. Of course a common curacy would not do for Tresilian.'

'Of course not,' said Lucy; 'I should have thought he would have taken a bishopric at once.' 'Come now, Miss Dashmarton,' cried Tresilian; 'don't chaff a fellow, now; ha, ha!'

Mrs Whitwick, seeing that her son was pleased, smiled too, condescendingly. 'You are so severe, Lucy; you really want some one to curb you,' she cried, shaking her finger in playful menace. 'But you know some of these curacies are so disagreeable. Upon one trying occasion, Tresilian had to lodge over a barber's shop; and really on Saturday nights the snipping, and shaving, and stamping of feet in and out—oh, it was dreadful!'

'But the pomatum was the worst,' said Tresilian.

'Yes. Fancy in the hot weather the smell of the pomatum and hair-oil. Poor fellow, he shall never be exposed to anything of the kind again. His pa is going to build him a church by-and-by; but in the meantime, a most fashionable neighbourhood, a charming house—the vicarage—the rector gives it up to him, being a man of large property, who lives at the manor. Plenty of room for his old mother, when she comes to see him—ah, and for a young wife too, Miss Dashmarton!'

'Perhaps not,' said Lucy sagely; 'it might not be big enough for them both.'

'Ah, of course, my dear Lucy, the mother would retire into the background then.—Tresilian, my dear, I must have one or two of these charming blue flowers I see at the end of the garden—with your permission, Lucy. Ah, do go and get me some; and, my dear boy, run round to the gate first, and see that Thomas is not teasing the horses; flick, flick, flick; he drives them almost mad when we are not looking after him.—And now, my dear,' said Mrs Whitwick, as soon as her son had left the room, 'now that we've got rid of Tresilian, I want to speak to you seriously. Poor boy, he has set his heart upon you. Candidly, I tell you I would rather he had waited; but I can deny him nothing. Now, Lucy, what are you going to say to him?'

'Why, when he comes and asks me himself, perhaps I may give him an answer.'

'But, my dear girl, consider; the poor boy's nerves are so delicate. I am sure that the shock of a refusal would unman him completely. Not that I think you *would* refuse him, dear, for just consider, an only son—all his pa's property and mine. You were laughing about a bishopric just now, Lucy; but I assure you there are many bishops who are worse off than Tresilian will be by-and-by.'

'Still, if I can't make up my mind to like him, Mrs Whitwick?'

'Well, Miss Dashmarton,' said Mrs Whitwick, 'I can only say that there is not a girl within twenty miles round who would not have jumped at such an offer; but if you don't know your own mind—Ah, what's that?'

'It sounded like a shot,' said Lucy, going to the window, through which Tresilian was just entering.

'Yes, it was a shot in the woods,' said Tresilian.

Shortly afterwards, the clock on the mantel-shelf struck the hour three, and the church clock boomed solemnly forth. At the same moment, a sharp rat-tat was heard at the door, a noisy double-knock, which had a certain business-like harshness about it.

'It was my father, I daresay, firing a parting shot at a rabbit; he is coming home now, I fancy.'

'And yet,' said Tresilian, 'it had a muffled heavy sound, like a gun fired close to the ground.'

'More visitors, it seems,' cried Mrs Whitwick, rising, as the servant entered with a card. 'We can't stop any longer, Lucy, no, not even to see John Dashmarton. We'll find our way across the lawn, dear; and think of what I've said, and try to make up your mind.' Mrs Whitwick kissed her fingers, seized her son by the arm, and led him out.

'Mr Elkins,' said Lucy, reading over the name on the visiting-card. 'I don't know him; but shew him in, Jane; he is one of papa's friends, I daresay.'

Mr Elkins was a short, precise-looking, elderly man, dressed in professional black, with a shrewd, pinched face, and bright, wide-open, unwinking eyes. He bowed very coldly to Miss Dashmarton. 'I have an appointment with Mr Dashmarton,' he said—'three o'clock prompt.'

'Papa will be here directly, I think. I heard his gun in the home-woods just now.'

'Oh, shooting, is he?' said Elkins, looking at his watch with a dissatisfied expression. 'My time is valuable, young lady; can you let your father know that I am waiting? Mr Elkins, the auditor of the Chilprune estate.'

'But Mr Partridge is the auditor, and my father did not expect him for another month.'

'Mr Partridge has resigned, and I am here in his place; and, as I said before, my time is valuable.'

'You are not so nice as Mr Partridge, anyhow,' said Lucy to herself; for Mr Partridge's visits had always been occasions of festivity at Mordien. He usually gave plenty of notice of his coming; a dinner-party was generally arranged in his honour; and he was such a funny, courteous, pleasant little man, that his company was always appreciated. But this new man didn't seem at all pleasant, and Lucy did not think that she would even ask him to stay to dinner.

'Perhaps you can shew me the books, young lady,' said Elkins, after a moment's fretful impatience, 'and I can make a start.'

'O dear, no,' said Lucy; 'I would not touch any of papa's books on any account—he would be so angry.'

At this moment the drawing-room door was flung violently open, and two handsome spaniels, panting and open-mouthed, dashed into the room, and sprang joyously towards Lucy.

'O Chance, Dash! you naughty dogs, get out of the room directly.—But papa is home now, anyhow, Mr Elkins; here are the dogs.' Lucy ran to the door, and called out loudly: 'Papa, papa! call away these dogs of yours; they are making such a mess in the drawing-room.' But there was no reply; and Lucy, with an undefinable feeling of uneasiness, ran out to the gate, to see if her father was coming along the road. But instead of her father's well-known figure, she only saw the keeper hurrying towards the house, his face ashen pale. 'What's the matter, Giles? Is anything wrong?' cried Lucy, her heart giving a strange throb of foreboding.

'Master—master!' gasped the keeper—'in the home-wood—shot dead—through the heart!'

There was a long argument among the twelve honest farmers and tradesmen who formed the coroner's jury over John Dashmarton's body, as to the verdict they should return. That no one was

concerned in his death but the man himself, was evident enough. His gun, still smoking, had been found at his side; whilst in the trigger-guard was twisted a flexible strip of ground-ash, that had no doubt been the means of discharging the weapon. Half the jury had come to the conclusion that the death was the result of an accident. John had been making his way through the wood; his gun had caught in this twig; he had turned round to disentangle it, and had received the contents in his chest. The other half pointed out the improbability of a man like Dashmarton, an old and careful sportsman, carrying his gun in such a reckless way. Some of these latter, too, remarked, that they had noticed John looking a bit worried lately; and altogether they thought that a verdict of temporary insanity would best discharge the obligations of their oath, without unnecessarily distressing the feelings of the dead man's relations. But the foreman, a well-to-do farmer, a great friend of poor John's, threw the weight of his influence on the other side. 'Why should we go and cast a slur upon the family?' he asked—'a family as has always lived respected among us. There was never any insanity about John—as clear-headed a man as ever lived, and what's more, one as paid his way, every halfpenny of it. Why, I happen to know that John went round the town the day before he died, and settled up every bill he had in the place. Does that look like temporary insanity?' This statement was corroborated by more than one of the shopkeepers who were on the jury, and led to a general revulsion of feeling. The more favourable verdict was returned—'Accidental Death.'

Even in the depth of her distress at the loss of so kind and loving a father, Lucy Dashmarton had a sense of vivid relief and comfort, when the result of the inquest was told her. An uneasy doubt had entered her mind; she strove to thrust it out, but it dwelt there, nevertheless. Could her father, in a moment of depression and causeless dread, have put an end to his own life? He had not been himself, of late, had sometimes fallen into fits of low despondency. His manner—to her more affectionate than ever—had often about it a tinge of sorrow and regret. When he had kissed her sometimes, she had seen his eyes dimmed with tears. At the time, she had set this down to nervous fancies about his health and prospects of life; but now she dreaded, and the news of the coroner's verdict came to her as an answer to her unjust suspicions, and relieved the dark shadow that had fallen upon her heart. Those who were best qualified to judge had put it on record, after a long investigation, that her father was guiltless of self-slaughter.

Spiller was on his way home; he had been telegraphed for, and was expected that evening; and Lucy put off her grief for a while, whilst she hurried here and there to see that everything was ready for his reception. Many other duties fell upon her; and the messages and condolences from all the county round were incessant—very gratifying, as shewing the respect in which Dashmarton had been held, but at the same time keeping the house in no little confusion.

Mr Elkins the auditor had not yet made his appearance again at Mordien. He had attended the inquest as a casual spectator, and had smiledardonically when the verdict was given. But Lucy

had a note from him in the course of the day. Mr Elkins was deeply sorry to intrude at such a moment, but his time was valuable. The books of the estate were the property of the estate, and must be given up to him, that he might perform his duties. He would call in the course of an hour, and trusted that Miss Dashmorton would give the necessary orders.

To this Lucy replied that her brother was the master of everything now, and that she could do nothing till his return. He was expected home that evening, and Mr Elkins could see him then.

Spiller came as expected—a good deal agitated and distressed at meeting his sister under such altered circumstances, but still with his natural self-importance cropping up through it all. He soon made it evident that he was the master now; and Lucy, too glad for the moment to be relieved of all responsibility, gave up everything into his hands.

When the first shock was over, Spiller reviewed his position with some little complacency. But yesterday he had on his mind the awkward fact that he owed two hundred and fifty pounds, and that ere long he would have to confess as much to his father, and beseech him to help him out of his difficulties. To-day, he was the owner, no doubt, of Mordieu—and that must be worth ten thousand pounds at least—so that, if he had been five times as much in debt, he need not worry himself about the matter. Then, as to the future, he could hardly perhaps hope to succeed to his father's post and the enjoyment of his full salary all at once; but still it was possible—a sort of hereditary right among the employes of a large estate being often acknowledged by those who owe so much to that principle. Altogether, Spiller looked hopefully to the future; and if, as he expected, his father had left a good round sum invested—the accumulations of his lifetime—to his sister Lucy, they might live together for a while very comfortably and easily, without troubling themselves about the Chilprune agency, if it did not fall in to him.

'Who is Elkins?' said Spiller to his sister, as that gentleman's card was brought in once more. 'And what does he want bothering at this time?'

'He is the new auditor,' said Lucy. 'He was to have met papa yesterday at three o'clock, to go through the books, and it was just at that hour—' Lucy was overpowered with the reminiscence, and hastily left the room.

'Perhaps,' said Spiller to himself, 'I had better keep in with these people if I mean to try for the agency.'

Mr Elkins was therefore admitted. He had brought with him the clerk who was employed by Dashmorton at certain periods to help him with the accounts.

'This young man knows where everything is kept, I believe,' said Elkins in explanation.

Spiller led the way to the business-room. The books of the Chilprune estate were kept in a fire-proof safe built into the wall; Spiller had his father's keys, and it was soon opened.

'There's only one book I want at present,' said Elkins quietly, 'and that is, the banker's pass-book.'

Dashmorton's funeral was attended by a large number of friends and by the tenantry of the Chilprune estate; but even at the ceremony itself sundry sinister rumours were whispered about. It was said that deceased was consider-

ably deficient in his accounts; that large defalcations had been discovered, that his estate was in fact insolvent. The purport of these rumours soon reached the Dashmortons in a very substantial, unpleasant form. Mr Elkins shewed conclusively a deficiency of ten thousand pounds in John Dashmorton's balances. The Mordieu property, it turned out, was mortgaged to its full value. The trustees of the Chilprune estate seized upon all that was left, and that was little beyond the furniture of Mordieu, the horses and carriages, and a cellar of choice wines. Nor was anything remaining for Spiller and his sister, except a few articles of furniture and some personal belongings, which they were allowed to carry away. So they were driven out from sunny Mordieu, and took lodgings for a time in the neighbouring town of Friddenden. Much sympathy was felt with the young people, and they received many offers of assistance. John Dashmorton had been wise in this; he had incurred no debts in the neighbourhood. He had, at all events, robbed no one but his employers, and even they did not feel it personally. Only the little being of the Chilprunes who was yet in the nursery would perhaps have a tiara of brilliants the less, or a *parure* of pearls, in the days to come. Thus all the world of Friddenden looked very favourably upon the Dashmortons, and did what they could to make them welcome; and as something must be done for daily bread, Lucy determined to set up a little school—a kind of preparatory school for young ladies.

SICK-NURSING, AN EMPLOYMENT FOR EDUCATED WOMEN.

To many who are anxious to give their daughters a staff to lean on in life, an occupation which will render them self-dependent and useful, the necessary education for the medical profession is too expensive, independently of other and more serious difficulties. Latterly, many sources of employment have been secured to women; and within the last year, certain of the government offices have opened their portals to educated girls, capable of passing an examination by no means trivial, at the hands of the Civil Service Commissioners. With what success this step will be attended, it is early to prophesy. It has one great recommendation—namely, that the requirements are not such as to dismay any good pupil in a well-directed collegiate school, and can possess no terrors for those who have already passed the local examinations of the universities—a test which most parents who estimate real mental training for their daughters would desire them to submit to, whatever their prospects in future life may be.

The complete recognition of the large field of labour open to women as nurses, dates we think, from the time of the Crimean War, when Miss Nightingale and her band of assistants were of such incalculable service to the heroes of their country, when wounded, sick, and dying. Every one at that time felt that the dire necessities of war had developed a sphere for woman's work, the value of which could not be gainsayed; but it has taken years of effort, unassisted by the great pressure of the battle-field, to convince the directors of hospitals, boards of guardians, and district visitors, that to nurse wisely and well, and with benefit to the patient be he even a pauper, *intelligence* and

special training are necessary, and that without these qualifications a nurse (so called) is often a curse instead of a blessing. Gradually the state of feeling which made it possible for 'Mrs Camp' to be more than a creation of fancy, is passing away, and all classes are beginning to see, that in sickness the choice of a nurse is perhaps more important even than the choice of a doctor; that oftentimes life and recovery are in her hands, when the doctor has done his best or his worst as it may be. Nor will any who have ever passed through the valley of severe illness fail to estimate at its true value the tender care of one not only well instructed in her art, but by reason of her previous surroundings and education, capable of entering into the minute refinements of feeling, be they for pleasure or pain, which severe suffering frequently develops in a patient. Well can we understand the feeling which was gratified and soothed, inadvertently enough, in the frame of a poor dying girl in a workhouse, when we gently stroked her thin wasted hand. She exclaimed: 'Oh, do that again! It is so long since I felt a soft gentle hand—never since I was a little child!' At that moment we knew that were it no other gift in a woman which fitted her specially to minister to the sick, her soft white hand is in itself an instrument of healing.

But the education necessary for an efficient sick-nurse is not of the sentimental or dilettante sort; she must in the first place have good and vigorous health, which supposes also good spirits, and we think she ought to have a sympathetic and kindly heart devoted to her calling. At present there are but few women who take the social rank of ladies, who have given themselves to this work; and there are perhaps some difficulties to encounter in their necessary training when they volunteer for the service. Notable amongst the women of the upper classes who give their lives to the nursing of the sick, and to training others to do so, is Miss Florence Lees, the friend and assistant of Miss Nightingale. She was the first student of the art of nursing who entered St Thomas's Hospital, London, under the Nightingale Fund as it is called; and since that time she has seen considerable service in the hospitals of the continent in the Franco-Prussian War, and is now superintendent of the Metropolitan Institution for providing trained nurses for the sick poor. In an address on 'Nursing the Sick,' recently given by Miss Lees before the National Health Society, she explained the working of this nursing Institution, and the great benefit derived from its operations wherever they extend. Unconnected with any particular religious creed or denomination, the object of the association is to provide nurses for the sick poor in their own dwellings. Unless in a hospital, but few of our poorer neighbours know the luxury of a nurse in illness. With the best intentions in the world, neither the ability nor the time of the relatives of the sick admits of the necessary care and attention. Medicine given just when remembered, and dirt and squalor rendered more terrible and overwhelming than usual, from the extra demand which sickness makes on the resources of every household—these conditions must be apparent to all who have ever visited the sick poor in their habitations. The district nurse changes all this. As far as possible, after she is called in, the sick-room assumes a

different aspect; cleanliness takes the place of dirt; the atmosphere of disease is purified and changed, and many are the recoveries which can be traced mainly to her beneficent influence. The want of especial nursing is felt perhaps more terribly by poor than by rich patients, so few of the former class know even how to apply the simplest remedies, to prepare a poultice or to apply a fomentation; and it is with the hope of remedying this great deficiency, that the system of district nursing is being encouraged largely in London, and has already been most successful in Liverpool, Birmingham, and other large towns.

The nurses at present employed in London as workers amongst the poor, are taken chiefly from the class that would otherwise become superior domestic servants. They are lodged and boarded in a district Home, of which it is contemplated to open three as soon as possible in different quarters of the metropolis. Two are already in full operation, containing six nurses each, who are lodged, fed, and superintended by a district lady manager. Every nurse is required to undergo one year's training in a hospital; and most of the large hospitals arrange to receive them. In the Nightingale training ward of St Thomas's Hospital, the probationary nurses obtain a thorough professional education. As soon as the nurse has passed her hospital year, she is placed in one of the Homes of the association, and commences her practical duties as district nurse amongst the poor of the neighbourhood, directed and assisted by the lady superintendent of her Home. The expenses of training are not great, and are within the means of all but the very poor. The hospital year costs the probationer thirty pounds for her maintenance during that time, payable in two instalments, fifteen pounds on entering, fifteen pounds at the expiration of six months. Immediately on being received into the Home, and commencing work amongst the poor, the nurse receives a salary, beginning at thirty-five pounds a year, and increasing three pounds a year till it reaches fifty pounds. As a rule, each nurse is provided in the Home with full board, washing expenses, a suitable and sufficient uniform dress, a separate furnished bedroom, and the use of a comfortable sitting-room. Every nurse is required to work eight hours a day in her district; and as a rule, unless in some cases of sickness, her duties cease after five o'clock in the afternoon. This is, of course, whilst occupied in district work, which is in a measure a training for more advanced positions and greater responsibilities.

Miss Lees tells us that nursing the sick is by no means a cheerless or depressing occupation; she thinks that no brighter or happier group of women-workers can be found than the nurses in her Home; and we can well imagine that the deep interest that must arise in the mind of every woman engaged in so good a work, must greatly elevate and purify the character of the nurse herself. Miss Lees is anxious to induce gentleness to join her staff of nurses, and to qualify themselves by the prescribed training, and by the experience gained in district nursing, for the entire charge of special cases amongst those who can afford to make skilled nursing a remunerative employment for women.

Miss Merryweather, who until lately had the charge of the district nurses at Liverpool, and is now lady superintendent of the Westminster

Hospital training-school for nurses, is most anxious to induce ladies to join her ranks. The difficulties existing in the way of the intimate association of different classes of women in the training Home—at present too small for all requirements—may, it is hoped, be removed by the erection of a suitable building, and the inauguration of a fund in memory of the late lamented Lady Augusta Stanley, than whom none more fully appreciated and encouraged the idea of trained and skilled sick-nurses. We can well understand how valuable an assistant the anxious surgeon or physician might secure in a well-trained, cultivated, and intelligent lady nurse. It is often highly desirable, for the sake of change of air, to send a patient to a distance from her medical attendant; but lest matters should go wrong, and for lack of some friend whose knowledge is equal to the necessity of the case, the change is pronounced to be impracticable. We will suppose that a lady equal in social standing with the doctor himself, possibly with the patient also, has been engaged at the early stage of the illness, has, with the doctor, watched the progress and symptoms of the disease, and has taken her place as nurse and companion to the patient. Her education and experience are such that the doctor can with confidence trust her to keep a watchful eye on his patient, to note every changing symptom, and to keep him informed daily—hourly if need be—of the minute details of the case on which his treatment is based. In the charge of such a nurse, the most anxious medical man might trust his patient to remain at a distance, feeling sure that the state of the pulse, temperature of the body, and every changing phase of disease, would be accurately communicated to him by letter or telegram, and so enable him to regulate his visits intelligently and according to necessity, and not by the caprice of an excited and nervous patient, or an ignorant and terrified nurse. Such skilled attendance would undoubtedly command liberal payment; and we can well imagine that many who now toil their lives away as governesses—vainly striving to teach that which they never knew, and to exercise a vocation for which they were never fitted—might have experienced a very different fate, and spent happy and useful years, had it not been for the fixed idea which until lately remained unchallenged, that educated and refined women who required to earn their living must of necessity be governesses or nothing.

It is right to say that recently the committee of the Nightingale Fund have afforded increased facilities for gentlewomen wishing to qualify themselves in the practice of hospital nursing, and a limited number of such probationers are, as we have already stated, now admitted to St Thomas's Hospital upon payment only of the cost of their maintenance during their year of training. These candidates are supposed to enter with a view of ultimately taking superior positions in public hospitals and infirmaries. These lady probationers—whose ages should not be less than twenty-six to thirty-six years—receive instruction from the medical instructor and the hospital 'sisters' or chief nurses in the wards, and serve as assistant-nurses during their year of probation. The lady superintendent of the Nightingale Institution at St Thomas's Hospital is at all times accessible to written inquiry, and to personal visits on Tuesday

and Friday between ten and twelve o'clock. It is difficult to imagine an occupation for our daughters and sisters, more entirely in harmony with the character of a true woman, or more beneficent in its object than that of tending their afflicted fellow-creatures.

LEECHES.

THE great demand which suddenly sprung up for leeches for surgical purposes at the end of last century, caused their natural haunts in the swamps and marshes to be invaded by armies of collectors, who soon denuded them of their ordinary stock. The French seem particularly partial to leeches, and their use in that country has always been more general than elsewhere. As a consequence of the drain upon her supplies, she was the first to suffer from a diminished yield; and in time the famine spread to Hungary, Turkey, Greece, and Germany, and even to Algeria and Syria, all of which countries were ransacked in the search for these bloodthirsty creatures. The scarcity and dearth of leeches at last attracted attention, and it was, we believe, about 1830 that the idea was conceived by a Frenchman that leeches might be kept in regular farms and bred, just like any other animal for which there is a steady market. The idea was soon carried into practice, and with such success, that leech-breeding has come to be regarded as a distinct industry of no little importance, and is carried on to a considerable extent in different parts of the continent.

The success of such an establishment depends, of course, on the choice of a suitable locality, and as the spots best adapted for this purpose are generally tracts of marshy ground, which are either useless for any other purpose, or—worse than useless—a nuisance, the selection of such areas and turning them to account in this way, is a double benefit. As an instance of the advantages attending the establishment of the industry in such places, setting aside the actual and immediate profits of the trade, we may quote a French writer, who, twenty years ago, gave his experience of such an undertaking. Natural swamps previously neglected are cultivated and placed under control, their miasmatic effects are neutralised, and employment is given to many poor people, who would otherwise find it hard to get a living. In the department of La Gironde alone, about ten thousand acres of land have been devoted to this purpose; its value has risen six or eight fold; men's wages have risen from 1s. to 2s. 6d. and 3s. a day; women and children also find remunerative occupation; shops have sprung up where none previously existed; and the condition of the peasantry generally has been vastly improved.

Let us examine one of these farms which have been the means of doing such an amount of good. We will pay a visit to one of the first of many which were established by M. Laurens—namely, that at Purempuyre, about nine miles from Bordeaux. Here an area of about four hundred acres near the Garonne, is devoted to this industry. The marsh is subdivided into compartments of five or six acres in extent, each of which can be inundated separately. It is surrounded by a ditch eight feet wide by five feet deep, outside which is a bank of earth which acts as an obstacle to the escape of the

leeches, and which also enables the watchmen to go round the property at night without being seen; for there are some thieves who cannot resist the temptation of stealing even leeches when the opportunity presents itself. Outside the bank, is a second ditch, connected with the inner one by occasional breaches in the intervening bank. Each compartment is intersected with drains, and can be flooded or laid dry at will by opening the hatches with which the ditches are provided. In the case of draining the water off, the lower hatches are replaced by perforated metal ones, through which the water, but not the leeches, can escape. Besides these breeding-grounds is a reservoir, similar to them in every respect, which is replenished at every opportunity with the larger leeches; so that, when the other beds are laid dry, there is always a stock on hand ready for the market. This reservoir is always kept covered with water to the depth of three to five inches, and holds from forty to fifty thousand leeches to the acre—a rate rather larger than that observed in the breeding-ponds, which are populated to the extent of thirty to forty thousand leeches per acre. During the cold season the leech remains quite underground; but the first rays of the spring sun bring him out, and then a troop of horses is made to enter the breeding-grounds, in the proportion of ten to the acre. The leeches attach themselves to the lower part of the legs of the animals, and then gorge themselves. The same troop of horses remain 'on service' for five or six hours, when they are recalled and tended, and sent back to their pastures, where they are allowed to rest and regain strength. After eight or ten days' rest, the horses are again despatched on duty; the hitherto unfed leeches, and those that have digested their last repast, come out again; and from about the 1st of March to the middle of June they are thus fed about eight or ten times each.

In June, the leeches all go underground, and the laying dry of the parks commences; the horses are kept out of them, the weeds and reeds are allowed to grow, and the soil becomes better knit together, as it were. In July and August the leeches come out to deposit their eggs in the tufts of herbage, and then the drains before mentioned are filled with water enough to keep the ground moist. The leeches having performed this duty, again burrow underground, and in a short time the young ones make their escape from the eggs.

The parks are now inundated, and at the end of August the fishing commences. The fishers, protected by high boots, enter the pond arranged in lines, and beat the water with sticks, to arouse the dormant leeches, which soon appear in great numbers, ready, after their long fast, for another feast. The large ones are carefully lifted out and placed in bags, with which each person is provided; and the line of fishers gradually advances till the whole bed is thoroughly beaten. It is then left to be subjected, three or four days afterwards, to another careful search, a sufficient stock being always reserved in the shape of the young and small leeches, and those that, not having digested their food, do not put in an appearance on the uncere- monious summons of the collectors.

The price of leeches in the market now is about four pounds per pound-weight—an average of five hundred individuals going to the pound. An

establishment such as that described above will produce several million leeches annually in a healthy condition. Serious losses are experienced in cold weather, and in consequence of injudicious handling of the annelides; but the profits are nevertheless considerable, as the cost of maintenance and collection is not very great.

The method of feeding these interesting flocks is, as we have said, by sending a number of horses into the ponds periodically, for unless leeches are provided with an ample commissariat, they will take themselves off in search of forage elsewhere. The horses used for this purpose do not suffer to anything like the extent that might be imagined. They are closely watched during the operation, and carefully tended afterwards. In many cases, horses which have been bought for a trifle have, under the care bestowed upon them, improved so wonderfully as to have been sold afterwards at a profit, so little does the system injure them. Old horses, whose lives have hitherto been a succession of hard knocks and fastings, and a perpetual round of fatiguing journeys, here find a relief from their burdens; death is deferred for months, and even years, and the latter period of their life is passed in a paradise, compared with the experience they have gone through.

Paris alone 'consumes' some twelve million leeches annually; and, prior to the establishment of the system of producing them in artificial reservoirs, the annual importation into France from abroad, exclusive of its own production, was nearly fifty millions. The enormous demand for these useful surgical attendants throughout the world may be estimated from the above figures.

A LULLABY.

Hush! hush! The night draws on;
The sun has long since set;
And the fast-closing flowers
With heavy dew are wet.

Shut close thine eyes;
Twilight is darkening the skies.

Hush! hush! All sounds are still;
The birds are gone to rest;
The mother-bird keeps warm
Her young within the nest.

Shut close thine eyes,
For the last songster homeward flies.

Hush! hush! The moonbeams fall
Upon the summer leas;
The night-wind murmurs soft
Among the dusky trees.

Shut close thine eyes,
For the last streak of daylight dies.

Hush! hush! The day is done.
Lie down, my child, and sleep;
The silver stars above
For thee a watch will keep.

Shut close thine eyes;
Sweet peace upon thy pillow lies.

Hush! hush! And happy dreams
All through the silent night.
Fear nothing; slumber on
Until the morning bright.

Shut close thine eyes,
For angels sing thy lullabies.

PRICE 1½d.

GILBERT WHITE.

In the sequestered village of Selborne, in Hampshire, lived, a hundred years ago, a clergyman named Gilbert White. Apart from his sacred office and his reputation for learning, his parishioners thought little or nothing of him, except, perhaps, that he was an oddity. The parsonage there was essentially his home. It had been his birthplace, and was destined to be his deathplace. Seventy-three years made up the sum of his tranquil existence. The very room in which he was born (18th July 1720), and in which he died (26th June 1793), is still shewn to the strangers who, out of respect for his innocent memory, come to take note of his haunts under those picturesque old roof-beams.

Imbued with a strong love of nature, this earnest observer had an eye for every living thing he met with during his rambles. The subtlest change in the atmosphere, the first unfolding of a leaf, the first budding of a flower, he took note of, as matter of importance. For him a saunter down a lane, a stroll through his own garden, a peep into a hedgerow, a momentary glance at a wayside bramble, was fraught, any day in the year, spring, summer, autumn, or winter, with keen enjoyment. A thousand chances to one but at these times some hitherto unregarded fact in the natural sciences would in a twinkling be brought to the knowledge of this investigator, who, having recognised the new fact, would duly record it for his own satisfaction and for the benefit of others. And it was through the simple day-by-day accumulation of the notes thus jotted down, apparently haphazard, and given to the world in a series of Letters, that there gradually, almost imperceptibly grew up, as an oak does from an acorn, that vigorous and indigenous product of the English soil and atmosphere, White's *Natural History of Selborne*.

Nestling in one of the most richly wooded corners of perhaps the best timbered district in England, the village of Selborne lies at a distance of fifty-four miles to the south-west of London.

Two hours' journey from the Waterloo Station by railway, and another hour's drive, in a fly, from the Alton Station, bring the traveller by two easy stages to his destination. The single straggling street three-quarters of a mile in length, which forms the main road of the village, is sheltered from the westerly winds throughout its whole course by a precipitous height running parallel with it, known all over that country-side by its old Saxon name of the Hanger. This noble acclivity rising abruptly three hundred feet above the village, is clothed from spur to summit with an umbrageous mass of beeches, and is at once the screen and glory of the village. Skirting either side of the cartway worn by the traffic of generations, and immediately under the shadow of this beechen Hanger, is a line of thatched cottages with diamond-paned lattice-windows, each with its little patch of garden, bright in the summer-time with gilly-flowers and sweet-williams, and in the autumn with tiger-lilies and hollyhocks.

Whatever changes have come upon the place during this century have only helped to beautify it. Its woodlands are more umbrageous; its thickets are more densely tangled; its hedgerows are more luxuriant. But the flowers, the birds, the beasts and insects of coppice, lane, and mere—the flora and fauna of Selborne—are nowadays very much as they were when watched and recorded more than three generations back by the old parson-naturalist. Written though his book was so long ago, it is still to this moment the exactest possible handbook to Selborne.

The original edition, published in 1789, was a quarto of four hundred and sixty-eight pages. It consists of a series of letters, one hundred and ten in number, addressed partly to Thomas Pennant, partly to the Hon. Daines Barrington. Since its earliest appearance, the work has been several times reprinted, often with additions, never once—a fact that has its significance—with emendations. Within the past twelvemonth a charming reprint has appeared, with Notes by Frank Buckland; a chapter on Antiquities by Lord Selborne;

some New Letters; and illustrations by P. H. Delamotte. (London, Macmillan.) Than Frank Buckland, no more suitable editor could have been selected among living naturalists; and very lovingly has he discharged the duty intrusted to his hands. As for the embellishments scattered through the volume, they are worthy of the letter-press. Delamotte's frontispiece gives at a glance the whole panorama as seen from the Hanger! The village itself, the white tower of the rustic church, the snug parsonage, the comfortable farms, the pretty cottages sprinkled over the landscape, the straw-yards, the hop-lands and the corn-fields, are all so clearly indicated by the artist's pencil, that that single leaf strikes you as a revelation. Instead of looking at a picture in a book, you are there, at that aerial height among the beeches, gazing down at the old Hampshire parson's homestead. Opening the volume elsewhere, you are in the central playground of Selborne, called familiarly the Plestor, where, with a circular bench for gossips round the trunk, flourishes to this day a noble sycamore, upon the site of which formerly stood, for at least four centuries, a vast but stunted oak that was levelled to the dust eventually by a hurricane. Hard by, from time immemorial, stood the village maypole, round which the lads and lasses danced to the pipe and tabor every spring-time, when the Maid Marian of the season was crowned with cowslips and May-blossom.

The parsonage of Selborne—now and for the last three-and-thirty years the residence of a worthy successor, Professor Thomas Bell—is a snug, homely rustic dwelling, trailed about, up to the very eaves, and in between the dormer windows on the roof, by blooming creepers, such as rose and clematis. A world of greenery brims up the front-garden to the very palings, so that as you stand outside in the roadway you catch but a half-glimpse of the front-parlours upon either side of the porchway. From under that trellised porch, and out through the little swing-gate in front of it, old Gilbert White has often emerged upon the village highway—a little, thin, prim, upright man in the clerical wig, buckled shoes, and knee-breeches of a by-past generation.

Crossing the entrance-hall, which has a curiously low ceiling, you are at once in White's own study—the very room in which he so often wrote and meditated. And yonder, propped in a corner, is the very walking-stick (a pale Malacca) upon which he so often leant in his tranquil saunterings.

In the back-garden, at the opposite extremity of a lawn covered with a deliciously soft grass carpet, upon which Frank Buckland's observant eyes took note that many water-wagtails were busily at work, you come upon White's own sundial. Visible at a glance from that back-garden on the acclivity of the hillside, is the Zigzag pathway (so called and so formed), tempting way-farers to climb the Hanger. Immediately at its foot is a shiver-leaf aspen, reputed to have been planted as a sapling by Gilbert White himself, a splendid tree, now a hundred feet high and eight feet six inches in circumference. So completely does the whole scene breathe of the old-world days when the Selborne parson strolled there noiselessly over the turf, or with crackling shoes over the gravel, that you are half inclined to look about you among the flower-beds for Timothy

his tortoise, to hear the clucking of his favourite bantam hen Guntery; or are prepared to encounter at a turn of the shrubbery, his faithful Thomas, at once butler, valet, gardener, and assistant-naturalist; a factotum whose very 'small beer,' when he brewed, his good old master did not disdain to 'chronicle.'

Gilbert White was born in the very same room in which seventy-three years afterwards he peacefully breathed his last. The house—familiar even then as a home to several generations of his family—was at that time the residence of his grandmother. His father, John White, a barrister of the Middle Temple, was the only son of the Rev. Gilbert White, vicar of Selborne. The naturalist's mother, Anne, was the only child of the Rev. Thomas Holt, rector of Streatham.

Passing over his education at Oxford, where he took honours, we find him installed in the old family home as parson, taking with delight to a humdrum existence, that, for nearly fifty years together, was as the very breath of his nostrils to him as an Out-door Naturalist. His habits were secluded and temperate, his life being singularly monotonous and methodical. For years together he kept a diary with scrupulous care and neatness; while as for the epistles that, growing up side by side with this diary, compacted themselves into the completest possible History of Selborne, upwards of twenty years were given by him freely to the task of their compilation. The earliest date affixed to them was the 4th August 1767, the latest being the 1st January 1788. It was his custom, whenever he returned home from his out-of-door excursions, to take the first sheet of paper that came to hand and write upon it the day's observations. Having no blotting-paper in those days, the metallic glitter of the pounce sprinkled upon the wet writing may even yet be discerned.

The naturalist's father in his will directed that no monument should be raised to his memory, desiring only, as he said, to have his name inscribed upon the Book of Life. The son's name, it may be remarked with truth, has been inscribed by his own hand upon the Book of Nature. And although in the chancel of the old church at Selborne there is a marble tablet to his memory, his actual burial-place, with a modesty akin to that of his father, is barely indicated. A headstone marking the fifth grave from the north wall of the chancel has upon it his initials and the date of his death, the lettering being almost filled up and obliterated with moss and lichen. Otherwise, there is but a slight heave of turf, beneath which repose the remains of the naturalist and philosopher. Close by, within the toss of a pebble, is a grand old yew-tree, the age of which is unknown, the girth of its giant trunk being five-and-twenty feet; popular tradition according to it an existence of at least seven centuries.

So luxuriant is the vegetation all round Selborne that Mr Buckland pronounces it to be 'a primeval English forest.' Its Hanging Lanes, not less than its Hanging Woods, are among its distinctive peculiarities. These Lanes are really rocky hollows, which in the lapse of ages have been worn down by the fretting of water and by the traffic of generations. New roads having been opened to the neighbouring towns since Gilbert White's time, that traffic has long ago ceased

altogether. They are much wilder, consequently, these wonderful Hanging Lances, than they were in his day, having been for years almost untrodden. Bisected by the high-roads now traversed to Alton and Liss, they reveal the aspect of matted jungles, are avoided as frightful traps by fox-hunters, and altogether present a mingled wildness and beauty that Salvator Rosa's pencil would have rejoiced to delineate. Looking more like water-courses than anything else, even a hundred years ago, these sandy channels—walled upon either hand by the gnarled roots of the stunted oaks, hazels, hawthorns, and dog-roses, by which they were overhung—had their banks carpeted in profusion with wild strawberries, ferns, and primroses. From the presence of so many trees all over the parish, the air of Selborne is soft and moist even to humidity. The manor, in all its sloping coverts, abounds with hares and pheasants and partridges. In old days, the woodcocks thereabouts were plentiful. A few quails may still be met with, these however mostly affecting the open; and after harvest you may come upon an occasional land-rail. The whole country is abrupt and uneven, being full of hills and woods, and consequently rife with birds of unusual variety. Hence it is that while Gilbert White is, in the broadest sense of the word, a naturalist, he is especially and pre-eminently an ornithologist. Secluded from the rest of the world at Selborne, he watched the coming and going of the feathered tribes with the intensest curiosity. While he had the keenest sympathy, of course, with the poor of his parish, who during the dear months of the year were busy spinning wool for the Quakers at Alton, to turn into the 'gentle corled stuff' called barragons, he had a watchful observation also for the light-winged denizens of the air. Nothing escaped him in this regard. He not only haunted his own garden chiefly to observe their habits, but made frequent excursions to the royal forest of Woolmer, a domain seven miles long and two and a half broad, that always afforded him an endless amount of entertainment both as a sportsman and as a naturalist. There he listened to the piping and drumming of the snipes, and marked, according to his opportunities, the fitful ways of the wild ducks, teal, and lapwings. His vigilant glance took note of the widgones preening and resting among the osiers in Woolmer Pond until sunset, when they went forth in parties in quest of food to the neighbouring brooks and meadows.

There can be little doubt that among his parishioners he was regarded throughout life as one in no way out of the common—as, indeed, a mere potterer and maulderer. Two years ago, the oldest inhabitant at Selborne, one Mrs Small, a shrewd intelligent old woman aged ninety-three, and who was consequently eleven years of age when Parson White died, speaking of him to Mr Buckland, described him simply as 'a quiet old gentleman, with very old-fashioned sayings.' A village labourer named Henry Wells, and nicknamed Farmer, told the same authority last year, with a sense of mother-wit underlying the simple observation, that Gilbert White was 'thought very little of till he was dead and gone, and then he was thought a great deal of.' While, a whole generation back, a writer in the *New Monthly Magazine*, in the course of a paper descriptive of

a visit then recently paid to Selborne, reported the remark of an old dame who had nursed several of the family, to the effect that Parson White was 'a still quiet body'; adding, almost in contemptuous commendation: 'There wasn't a bit of harm in him, I'll assure you, sir; there wasn't indeed!'

Early in the correspondence that was to render him so famous, it is amusing to find the naturalist complaining that he lacks a companion 'to quicken his industry and sharpen his attention;' as if they admitted of being quickened and sharpened! By reason of this, he modestly insists he has made but slender progress in a kind of information to which he has been attached from his childhood. Moreover he had a charmingly unaffected tendency to self-depreciation. Thus, when describing, under date 25th December 1778, in a letter to his sister Mrs Barker, the fine warm winter-room his great parlour made, he—who must surely have been gifted with the keenest sense both of sight and hearing that naturalist ever enjoyed—laments naively, as the chief fault in the apartment, 'a strong echo, which when many people are talking makes confusion to my poor dull ears!' His every sense, we may be certain, was exquisitely refined, and matters trivial to others were important enough for him to note and chronicle. If a Stone-curlew is skulking on the bare ground, where it lays its eggs, endeavouring to evade his observation, and undistinguishable itself from the gray spotted flints around it, his keen glance detects it by the spark-like scintillation of its eye. He perceives upon the instant what nobody had perceived before, that bats sip water as they fly. If, in handling one of these creatures, his olfactory nerves are affected by its rancid and offensive smell, his sense of sight and feeling are simultaneously so gratified that he seems yearning over what the moment before has nearly sickened him. 'Nothing,' he says, 'could be more sleek and soft than their fur, which was of a bright chestnut colour.' Gilbert White it was who noticed that birds are strangely influenced by colour in the choice of food; not always, by the way, to their own advantage. Thus, though white currants are sweeter, they eat up all the red before touching the white, in spite of the latter being the riper and more palatable. He comments upon the noble and providential supply of ivy-berries for birds in winter and spring; the black fruit of that evergreen never appearing to freeze, whereas at the first sharp frost the haws are ruined. The hedge-sparrows at breeding-time, he notes, have a remarkable flirt with their wings; while he distinguishes between the redstart, shaking its tail horizontally, as a dog does when it fawns, and the up-and-down bob of the wagtail, like that of a horse completely jaded. Nothing distracts his attention. In the midst of what he calls 'an awful thunder-storm,' for example, on the 23d December 1791, we find him busy counting the number of seconds between flash and explosion. Every now and then, too, he evidences a quiet sense of the humorous, peculiarly his own; the merest glint of a smile, as we may conjecture, flitting over his features at these times while he is jotting down his observation. Thus, when he is remarking that in August the winged ants swarm by myriads in the air, bent on immigration, he adds that they

do so 'to the great emolument of the swallows, who fare luxuriously.' Again, where he speaks of their having had a weekly concert one winter at Selborne of 'two violins, two re pianos, a hautboy, a German flute, and a violoncello,' he refers to the entertainment as presumably 'a great annoyance to the neighbouring pigs, which complain that their slumbers are interrupted and their teeth set on edge.' Or, again, if he is expatiating upon the peculiarities of that eccentric bird, the Long-legged Plover, of which there is a folding sketch opposite page two hundred and nine in the first quarto edition, its legs, as he expresses it, are distinctly 'in *caricatura*, the length of them being so extraordinary.'

He is his own Boswell, this simple-hearted parson-naturalist. He lets us into an intimate knowledge of all his little whims and oddities. He babbles his partiality for whipped syllabubs. He speculates with a tenderness that is half pathetic over what he conceives to be the erotic rather than simply erratic movements in June of Timothy the tortoise. If he grumbles about the dogs eating his gooseberries, he anticipates the modern outcry against bird-murder by energetically defending the rooks and crows from destruction, as themselves the destroyers of vast numbers of cockchafers. His wildest conjectures he puts into the plainest possible language. He wonders to himself and to his correspondent, and is wondering on now to posterity, whether it may not be possible to naturalise canaries by placing their eggs in the nests of their congeners the goldfinches and greenfinches, the callow young being possibly rendered hardy before winter, and able to shift for themselves. He speculates quite seriously as to the possible hibernation here in England of a few straggling swallows. Apropos to which not unfrequent surmise of his, we would here note the fact, that on the 3d of November 1789, the good old parson of Selborne made quiet record in that secluded village of the fact that 'Two swallows were seen this morning at Newton Vicarage House hovering and settling on the roofs and out-buildings. None have been observed at Selborne since October the 11th. It is very remarkable that after the hirundines have disappeared for some weeks, a few are occasionally seen again; sometimes in the first week in November, and that only for one day. Do they not withdraw and slumber in some hiding during the interval?' Observe the date—a date, in truth, so portentous—the 3d November 1789! It was the very morrow of the day, as it happened, upon which in France, the National Assembly at one fell swoop confiscated the whole ecclesiastical property, otherwise one-third of the entire landed property of that kingdom, estimated at about eighty million pounds sterling. Here, a simple-hearted curate in England wondering to himself with astonishment at the flight of a couple of swallows in November. Yonder, upon the other side of the Channel, a whole hierarchy shattered into the ghastliest ruin by something worse than a volcanic eruption or an earthquake—by the explosion of one of the most appalling Revolutions of which there is any record in the history of the human race. The startling contrast presented to view by those two dates and their respective incidents, demonstrates more clearly even than the beautiful book over which we have been lingering, that the lines of

Gilbert White's life had indeed 'fallen unto him in pleasant places,' when they led to his birth, his long career, and his peaceful death in that little silvan village of Selborne, of which it was his destiny to be the historian.

FALLEN FORTUNES.

CHAPTER XXXIV.—A CATASTROPHE.

'O MAMMA! Kitty! news, news!' cried Tony, running joyfully into his mother's room one morning. She was not yet up; yielding to her daughters' entreaties and to the monitions of her own growing sense of weakness, she had of late consented to take her morning meal in her bedroom.

As her son entered, she rose from the pillow with eager eyes.

'What news, my child? It is not post-time yet. How can there be news?'

Kitty too, who was arranging some late autumn flowers in a little vase upon the dressing-table, so that her mother should see them reflected in the glass, turned round with a beating heart. 'The ship must have arrived at Rio!' thought she.

'O mamma!' said Tony, his ardour greatly cooled, and half-conscious of having aroused undue expectations, 'the first snow has fallen upon the fell. It is quite high up; but one can see it plainly, and it looks so beautiful. Margate says that it will not go away again till late in the spring; and that its coming so early is a sign of a hard winter.—What is the matter, dear mamma?'

Mrs Dalton had sunk back on the pillow, and covered her face with her thin hands. What sort of news she had expected, Kitty knew not; but it was plain that the disappointment had been a terrible blow.

'A hard winter,' she repeated, 'a hard winter.'

'That is what Margate says,' continued Tony, reassuringly; 'but Margate may not be right, you know. And even if she is, what will it matter? The snow will fall and fall; the beck will be frozen; the roads will be choked up, so that only light carts can come; and we shall be snug and cosy in Sanbeck, all by ourselves, just as though we were out of the world.'

'Out of the world,' repeated his mother slowly.

'Yes, mamma; but why should we care, being all together,' reasoned Tony gently. 'I have heard you say yourself, that you are always happy when you have us about you; and I am so glad that I am not at Eton this half.'

She was kissing him now in a strange passionate manner, and the rare tears were streaming down her cheeks. Kitty would have drawn the boy away; but she signed to her to leave him.

'You have not forgotten who is *not* here amongst us all, Tony?' whispered she.

'O no, mamma: I often think of dear papa.'

'And pray for him, darling? Do you pray for him?'

'Yes, indeed I do; every night and morning,' answered he in her ear, 'just as you taught me. There is no snow where he is gone, Jenny says.—I went to Jenny first, because I knew she was up and at her desk. And I have promised her to write to him all about it. Margate says there will be skating on the mere, and sleighing; the timber trucks make capital sleighs, and the boys will draw me—half-a-dozen of them at a time, Margate says—and one shoots down the fell like an arrow.'

Now, all that will be something to write about to papa. I don't mind writing, when I have got something to write about—that's her difficulty, Jenny says; so it happens to clever people as well as to stupid ones. And oh, dear mamma, I do hope you will get out as far as the bridge to-day, and see the snow on the fell.'

Poor Tony came back to that as his one strong point, and the sole excuse for his enthusiasm; but he felt that it was not so strong as it was, and that he had overrated the importance of his tidings. He even understood that his mother's thoughts were too occupied with 'dear papa' to take much interest in the natural phenomenon which had taken place; but beyond that, matters were a puzzle to him. Kitty, on the other hand, now felt that Jenny had been right when she said that her mother suspected something was amiss; that her apprehensions respecting the *Flamborough Head* and the precious life it carried were not less poignant than hers and Jenny's, though they had not the same sad foundation. She had never said one word to her of her walk to the mere with Uncle George, or even referred to his visit; a suspicious circumstance of itself, and which, joined to what she had seen that morning, made tender Kitty's heart bleed.

Jenny had now no secrets from her sister as respected the steamer. Jeff had written again—at Jenny's desire—describing what had happened at Lloyd's; how first 'the Committee' had announced 'that they would be glad of information regarding the *Flamborough Head*,' and how afterwards it had been placed in the dread list of 'Missing Vessels.' Yet even he had not said one word of the paragraph about the wreck, wishing to spare his correspondent, and ignorant that his employer had already supplied the information.

So week after week went by, and the snow fell as Margate had prophesied it would do—heavier than it had been known to fall for many a year in Sanbeck; no roll of wheel nor beat of hoof was heard—and indeed, save the doctor's pony and the butcher's light cart from Bleabarrow (the latter only at long intervals), there was no traffic of any kind in the little valley. The voice of its stream was hushed, and its fir-trees, too heavily weighted by the snow, had ceased to murmur; all was silence and solitude. The Daltons were literally out of the world. Few letters arrived for them now, even when the postman came, which was not always (for there was danger of him being 'smooored' in the drifts); the most sympathising folks cannot be always writing to condole with us, and there was no opportunity, alas! in this case for aught else but condolence. Our misfortunes are wearisome to our friends as well as ourselves, and make dumb both us and them. As to the Daltons' ordinary acquaintances, who had been very numerous, the family had 'gone under,' and were already forgotten. Kitty was the one who suffered most from this isolation; to her mother it seemed well to be alone with her wretchedness; and Jenny had Occupation—the balm for anxious minds. She was for ever writing and reading. Kitty was fond of reading, but not of study; she was not omnivorous, like her sister, and the library of the late Mr Landell had few attractions for her. She was, in truth, a devotee at the shrine of the circulating library; a persecuted faith, but one which has a great many charming followers. As the

family subscription in London was not yet run out, the books came down with those of the Campdens to Riverside, and were afterwards forwarded by carrier.

'If the snow permits it, pray send me over our batch of books,' wrote Kitty imploringly to Mary; 'it is a case of real destitution; I am starving for light literature: not a novel has met my eye for a fortnight. I am now reading the *Pilgrim's Progress*—one of the most recent works in the library of the Nook.'

Mrs Campden denounced this note as 'flippant,' considering the circumstances of Kate's position. The writer, indeed, was by no means in a flippant mood; only she no longer wore her heart upon her sleeve with respect to Mary. She did not feel inclined to lay bare to her, her miserable anxieties, and affected a gaiety that she was far enough from feeling. It is true, we should never affect anything; but Kitty would have found it hard to please Mrs Campden now by any style of composition. With a large class of persons, the unfortunate, like the absent, are always in the wrong; and besides, the mistress of Riverside was angry with the girl for refusing or withholding encouragement to Mr Holt.

However, the books were sent off as requested, and reached their destination, although with some difficulty, and not until late in the afternoon. The carrier, who was suitably entertained in the kitchen by Margate in recompense for his courage, gave a terrible account of his journey. If his cart had not been the best built and lightest of all carts, and the horse a paragon of strength and endurance, he could never have come up the valley! The snow was five or six feet deep in many places, and hung so heavy on the hedgerows that they looked like white walls! He tossed off his glass of spirits so quickly after his meal, in order that he might get home before dark, that he found he had just time for another. The treasure he had brought with him was taken into the parlour, and at once divested by Kitty of its coverings. She had thrown down the brown paper and the white upon the ground, and plunged in a first volume of her favourite author; and under his benign influence, Time, notwithstanding its weight, and weariness and woe, was flying. She only knew that it was growing late because of the waning light, which made her bring the enchanted pages nearer to the window. Presently, her mother entered the room, and her first act was to pick up the discarded wrappings of the parcel.

'O mamma, I am so sorry,' said Kate remorsefully. Neither she nor her sister, though neat enough in their personal appearance, were really tidy; whereas, if Mrs Dalton had a weakness, beside good-will for everybody, it was for putting things straight.

'Nay, nay, my dear,' answered she, smiling; 'don't reproach yourself: it was natural enough that, in your eagerness for the kernel, you should forget the husk.'

'But that I should have made you stoop to pick them up, mamma—I am quite ashamed of myself.'

And she cheerfully shut up her book, with the air of a good nun who has prescribed for herself a penance.

'Nay, my darling; I am going to look through

our weekly accounts; so do not punish yourself in that way. I don't want you to make yourself agreeable just now; only please to get the lamp, for my old eyes will not serve me in this twilight.

Neither Margate nor her myrmidon were intrusted with the trimming of the lamp, which, with many another household duty, was now Kitty's peculiar care. Notwithstanding the economical fashion in which the Daltons lived at the Nook—it was much more meagre than what fine folk call 'quiet'—their establishment was to be even still more reduced; it was found that Lucy could not be retained beyond the quarter. The fact was, with all one's good sense and wish to spend as little as possible, certain free-handed habits—a shilling here and sixpence there, and food for whoever set foot in the house on real or pretended service—could not be discarded all on a sudden. In vain the weekly accounts were pared to the thinnest proportions; the 'extras' somehow swallowed up the savings. Of course it would be a pang to part with their last attendant; but not so severe as it would have been a few weeks ago. Although her emoluments were the same as before, Lucy was not so easily reconciled to the roughness of the new régime as were her mistress and the young ladies; and she complained of the lack of 'society.' Margate's gossip—for it is not to be supposed that Nature had denied her the usual topics of conversation—itsself by no means piquant, was also entirely local; while 'the gurl,' as the third retainer of the family was scornfully denominated by the lady's-maid, was a mere sponge or sucker. Her ears—and mouth—were open for everything, but there was no reciprocity. We cannot all of us be self-denying for ever; it is something if one makes a temporary sacrifice at the shrine of duty, and poor Lucy had found by this time that her promise of life-long service to her old employers would be not a little irksome to keep. So she was parting from them, though on the best of terms; and in the meantime Kitty was learning to 'make herself useful' about the house—a very elastic phrase, which, as we have seen, included lamp-trimming. A neater-handed Phyllis than Kitty it is impossible to imagine; and whatever she set her hand to she graced. If you could have seen her now, as she comes up the oaken stair with the lamp, burnished, and throwing its mellow light upon her golden hair, you would have said that the Daltons had one family ornament at least still left to them, one rare and beautiful picture, which—however humble its frame—would not escape the judicious eye of the connoisseur.

'Congratulate me, mamma, upon my success,' said she, as she stepped carefully into the parlour over the raised threshold that had been very literally a stumbling-block from generation to generation of the dwellers in the Nook: 'does it not burn well?'

There was no reply; and hastily setting down the lamp, Kitty looked around her in some trepidation. Under the deep window-seat where she had herself been sitting a few minutes before, lay a motionless figure.

'Mamma!' shrieked she, in an agony, and was down on her knees beside her in a second; then, 'Lucy! Margate! Help! help!' rang through the old house.

Her first thought was of physical aid, and there-

fore she did not call Jenny; yet Jenny arrived somehow—though her chamber was farthest off—as soon as the others. When the kitchen-girl, rushing in with the rest, wrung her hands and cried: 'She is dead, she is dead!' it was Jenny who said: 'Hush, fool!' as Margate afterwards observed, 'like a man,' and took the direction of affairs.

'Lift her up and put her on the sofa,' was the order that three pair of strong and willing arms promptly obeyed; and in the meantime, Jenny's own hands had removed the pillow.

'Yes; she has fainted—that is all, Jenny,' whispered Kitty with anxious pleading.

'How did it happen? Where did you find her?' returned the other, in the same low voice.

'Just as you saw her. I had left the room for the lamp, only a minute or two.'

'What is that newspaper in the corner?'

'It is what the books were wrapped in; mamma had just taken them up.'

Jenny walked quickly forward and picked up the paper. Her eye glancing quickly over the page, fell at once on the heading: *Supposed Loss of the Flamborough Head*. 'Good Heavens, Kitty, mamma has read it—the paragraph about the wreck.—Margate, some one must go for Dr Curzon instantly: not one moment is to be lost.'

'Indeed, ma'am, there is not a soul to send—if we had known it before the carrier had gone; but there is not a man nearer than Farmer Baynton's; and the snow'—

'I will go,' cried a small voice half-choked with sobs; and Tony, who had crept in unobserved, and was standing by his mother's side in a passion of silent grief, instantly left the room, and the next moment was seen flying across the courtyard.

'The poor child has not even put on his cloak,' murmured Margate pitifully. The night was falling, and the snow was deep; but at that awful time, with that lifeless form and death-like face lying before them, neither Kitty nor Jenny could think of aught save her who had given them being.

STORY OF THE LUTINE.

ON one of the closing days of the last century, the good ship *Lutine* left the shores of England, laden with a vast amount of treasure; on the following night she was wrecked on the north-west coast of Holland, and all the treasure went to the bottom. Hence arose the most remarkable case of 'salvage' operations ever known—operations not even now concluded, although more than three-quarters of a century has since elapsed. The newspapers and magazines at that time set down the value of the treasure, some at one hundred and forty thousand pounds, some at six hundred thousand; this grew to one million five hundred thousand, and at length mounted up to three millions sterling. There was, therefore, abundant scope for what would nowadays be called 'sensational' newspaper writing.

That a shipwreck should occur at that particular spot was not matter for surprise, seeing what fierce battles had long been going on there between land and water. The great gulf in North Holland called the Zuider Zee, now open to the German Ocean, was at one time an inland lake, separated from the sea by a continuous line of coast, low

and sandy, but still unbroken. On a particular night in the thirteenth century, the sea, under the influence of a furious north-west gale, broke through the barrier, and opened a channel to the inland lake. Later in the same century a second irruption took place, involving the sacrifice of a hundred thousand lives. Since then, an almost constant shifting of the sands has led to the formation of a number of low islands, which appear on the map something like a semicircular grille on the seaward side of the entrance to the Zuider Zee. These low islands bear the names of Wieringen, Texel, Vlieland, Schelling, Ameland, Schiermonnik, Rottum, Borkum, &c. Fringed with numerous shoals and sandbanks, they are separated by channels which are constantly shifting their directions and dimensions. The inhabitants hereabout are mostly hardy pilots and fishermen; but even they are embarrassed by the insecurity of their homes and the intricacies of the navigation. Ships of every class and almost every nation have been wrecked on that bit of treacherous coast; among them the *Lutine*.

In what way the freighting of the ship was managed, partly by the government and partly by merchants, has never been fully known, until a recent investigation of the subject by the examination of official documents brought to light the facts. Some public writers stated that the treasure on board was consigned by English merchants to their correspondents at Hamburg; some that it was sent by the British government to Texel, to pay the British troops at that time in Holland; some that it was a subsidy to the Dutch government; while others spoke of the crown jewels of Holland being on board, after having been reset by Messrs Rundell and Bridge, at that time the leading goldsmiths and jewellers in London. The truth appears to have comprised portions of most of these statements.

In September 1799, the Treasury transmitted a letter to the Admiralty, announcing that a large amount of silver coin was about to be sent to Texel, for the payment of British troops stationed there, as also a consignment of bullion to Hamburg; and requesting the Admiralty to furnish a vessel or vessels suitable for the purpose. The silver coin was speedily sent off in the *Amethyst*, which safely conveyed it to its destination; but similar good fortune did not attend the bullion. The Admiralty sent an order to Admiral Duncan, commander-in-chief of the North Sea naval squadron, 'to send a cutter to Gravesend, for the service of receiving on board some bullion and conveying it to the Elbe.' (The Elbe is the important river on the banks of which the city of Hamburg is situated.) Admiral Duncan made arrangements for sending either the cutter *Nile*, under Lieutenant Wood, or the armed cutter *Courier*, under Lieutenant Terrel; but when the merchants, bankers, and bullion-dealers heard that a vessel of war was to be employed on this service, they sent valuable consignments so largely to Duncan, that he thought a better defended vessel should be selected. He chose the *Lutine*, a French thirty-two-gun brig which he himself had captured, and which, clipped of the preliminary *La* in its name, had been added to the British fleet. Taking in a cargo of immense value, in bullion and other treasure, the *Lutine*, under Captain Lancelot Skynner, set sail from Yarmouth on the

9th of October—whether for Texel, or Hamburg, or both, is not even now quite clear. Before the Admiralty received Duncan's letter announcing the departure of the *Lutine* from Yarmouth, the unfortunate vessel was a hopeless wreck.

There was no Baron Reuter in those days, no submarine telegraph, no rapid means of communicating news by a flash from the continent to the British coast. More than a week elapsed before the Admiralty received official despatches relating to the disaster; although the underwriters or marine insurers knew about it much more speedily—one example, among many, of commercial enterprise outstripping the government. Admiral Mitchell, stationed off the Dutch coast, announced in a despatch that the hapless *Lutine* had been wrecked on the outward bank of the Vlieland Passage, in a heavy gale from the north-north-west. The *Arrow*, under Captain Portlock, and several other vessels, came to render assistance as soon as the disaster was known, but all without avail; for the *Lutine*, which struck in the night, was nowhere to be seen when day dawned; she had gone to pieces—the main portions sunk, and the fragments floating about. The treasure, whatever may have been its amount, of course sank by its own weight. But, more sad to tell, the officers and crew lost their lives, all except two men; and even these were able to give but little information concerning the disaster, for one of them died soon afterwards from the fatigue he had encountered; while the other, Mr Shabrack, a notary-public (there were a few passengers on board) was not versed in seafaring matters.

The government money for paying the British troops had mostly gone to Texel by the previous vessel, which had escaped disaster; the treasure on board the *Lutine* was the property of mercantile firms, and was consigned to Hamburg. As is customary in such cases, the treasure had been insured in marine insurance offices, or by underwriters; and when the loss of the vessel had been clearly certified, the underwriters promptly paid the heavy demands made upon them. When insured property is lost, the wreck or *débris*, under the name of *salvage*, belongs to the office or the underwriters, and is collected and brought to market so far as may be practicable. When, however, a ship is wrecked on a foreign coast, other considerations have to be attended to; and so it was in this case.

How the seas and the sands have been made to give up much treasure from the *Lutine* during a period of three-quarters of a century, and why it is that the enterprise is not ended even yet, we have now to tell.

The Admiralty sent orders to Admiral Mitchell to do what could be done to recover the stores and bullion from the wrecked ship; while Lloyd's Committee, representing the underwriters, sent out salvage-officers on a somewhat similar errand, for it was known that the treasure had belonged much more to mercantile firms than to the government. The two governments put in rival claims, but did not enforce them; the salvage-men could do nothing without well-appointed diving appliances; and thus it happened that for a considerable time the wreck was left to the fishermen of the neighbouring coast and islands, who managed to bring to light a harvest of treasure now and then. The wreck of the ship was partly exposed at very

low ebb, about midway between the islands of Terschelling and Vlieland, with the IJergat Channel close to it. In a year and a half the fishermen recovered no less than eighty thousand pounds worth of bullion: comprising fifty-eight bars of gold, thirty-five bars of silver, forty-two thousand Spanish silver pistoles, two hundred and twelve half-pistoles, one hundred and seventy-nine gold pistoles, with small quantities of quarter, eighth, and sixteenth pistoles, single and double louis d'ors, English guineas and half-guineas. The fishermen conducted their operations under sanction of the Dutch government, who took two-thirds of the proceeds, leaving one-third to the finders; the government share was taken to Dordrecht, and minted into about fifty-six thousand pounds worth of Dutch guilders. The fishermen suspended their operations at the end of 1801, because the wrecked hull of the *Lutine* had become covered with a great depth of sand, and because they formed an opinion (afterwards known to be incorrect) that the store of treasure was pretty nearly exhausted. One day they found a small packet of silver spoons, marked W. S.; they sent these to England, where they were recognised by the Rev. Mr Skynner as having belonged to his son, Captain Skynner, who commanded the *Lutine*. They also sent over a curiously shaped sword, stamped 'Cullum, King's Cutler, Charing Cross, London'; it was found to have belonged to Lieutenant Charles Castine Aufrère, of the same vessel. Sadly strange it was that not one dead body was ever fished up; either they had floated away seaward, or had sunk deeply into the sand.

In those troubled warlike times, when Holland shifted its alliance from England to France and from France to England, as exigence compelled, the two governments had more important matters to think about than the poor wrecked *Lutine*; the fishermen ceased to search for treasure; while Lloyd's agents found they had practically little power in the matter; and thus it arose that the first thirteen years of the present century passed without much being done in connection with the wrecked treasure-ship. In 1814, however, a gentleman of Terschelling, M. Pierre Eschancier, filling the office of Oppor Strand Vonder, wrote to inform the Dutch government that there was reason to believe in the existence of a large amount of treasure still in the *Lutine*. The ticketed gold and silver bars found had numbers and letters marked on them; the whole store had probably such numbers and letters in consecutive order; and there were great gaps here and there, inasmuch that he inferred that the bars still immersed in the sand and water were at least tenfold more numerous than those which had been fished up. Here was a tempting suggestion; here was a golden harvest ready to be reaped, if only the reapers were expert and persevering enough!

The Dutch government made a grant for the prosecution of renewed search. They began mainly by dredging, but found that the body of the wreck was far too deeply imbedded in shifting sands to be reached by that process. Tediously lingering were the operations for seven years, during which lengthened period the dredgers brought up only seventeen pieces of coin—a very sorry crop! In 1821 an agreement was made to the effect that the Dutch government would

advance a certain sum of money on condition of receiving one-half of whatever treasure might be recovered. M. Eschancier organised a society or company for supplying the rest of the means and carrying on the operations. A diving-bell and divers were obtained from England, and many attempts were made in 1822; but unsuccessfully. As not even a buoy could be kept steady among the ever-shifting sands, the exact locality of the wreck could not be determined. A sum of five thousand pounds was spent that summer, and no treasure fished up; the divers returned to England, the Dutch government bought the diving-bell, and M. Eschancier and his colleagues retired from an enterprise which had brought them much anxiety and no profit.

All this time we hear little of Lloyd's Committee and the English underwriters. But they suddenly woke up. The doings of the Dutch attracted attention. The underwriters at Lloyd's felt that if the wrecked *Lutine* still contained any treasure, the treasure or its value belonged commercially and equitably to them, who had honourably paid all the losses arising out of the insurance. They appealed to Mr Canning, who opened communications with the Hague; and the Dutch government agreed to hand over their half of the possible salvage to Lloyd's. Mr Canning advised Lloyd's to be content with that half, and to leave the other half to the Eschancier alliance or syndicate, with whom friendly working arrangements might probably be made. Diplomacy took a curious form on this occasion. The Dutch government made the cession to the British government, not to Lloyd's, 'solely as a proof of friendly feeling towards the kingdom of Great Britain, and in nowise from a conviction of the right of England to any portion of the said cargo.' Here we see that there were the materials for a pretty quarrel, if quarrelling had been the tendency of the two nations; the Dutch government claimed as salvage all wreck on the coast of Holland, and merely waived their claim on this occasion. The Dutch Alliance greatly disliked all this; they regarded Lloyd as an interloper. Nothing effective was done by either party from 1823 to 1830, when the instrumentality of England in bringing about the independence of Belgium so offended the Dutch as to convert coolness into anger; M. Eschancier, too, died about this time, and left no one behind him who cared about the matter.

The poor *Lutine* had sixteen years more of such rest as the ever-shifting sands would permit to her. A change in the Dutch laws, declaring that the salvage of all wrecks on the outer banks of the coast should be open to all persons on stipulated conditions, induced two English divers, Messrs Hill and Dowes, to petition the king of Holland for permission to dive for treasure in the *Lutine*. This was in 1846. It came to no practical results, and was followed by a long negotiation between Lloyd's and the remnant of the old Dutch Salvage Alliance. The Dutchmen woke up from time to time, and then went asleep again. Not until 1857 did a real working treaty come into operation; the Dutch to make all the research, Lloyd's to have half the proceeds.

Joy came over the dismal spot. A fierce southwest gale blew away some of the shifting sand that had so long buried the *Lutine*, and permitted approach to it. Lloyd's agent was soon able to

send home news that coins had been fished up, sufficient at all events to shew that the treasure-ship was not yet really empty. A whole fleet of fishing vessels came out from the Zuider Zee to aid in the golden search; and the Dutch government had some trouble in maintaining order among them. Year after year, something or other was fished up—now the ship's bell, after a silence of two generations; now a part of the ship's rudder; now a packet of gold bars, now silver bars. Between 1857 and 1861, the findings were such as to provide about twenty-two thousand pounds as Lloyd's share. The harvest was so small in 1861 as not to pay the cost of search; and not much has since been done. Nevertheless, an act of parliament in England, and an understanding with the Dutch government, give to Lloyd's Committee a continuous ownership of the *Lutine* and her contents; and it is within the range of fair probability that we shall again, from time to time, hear of dredging and diving near the remains of the poor old brig. Much depends upon whether the sand is drifted back again over the wreck, and channels closed up by furious gales. Lloyd's are not to pocket the treasure that may come to their share. When the Royal Exchange was destroyed by fire in 1838, most of the documents were lost which might have identified the original underwriters of the *Lutine* in 1799; and there are not now the means of determining who are the successors or representatives of those persons. The salvage proceeds are to be applied 'for purposes connected with shipping or marine insurance, according to a scheme to be prepared by the Society (Lloyd's), and confirmed by Order of Her Majesty in Council, on the recommendation of the Board of Trade subject to previous public notice, and to any claim by individuals that may be put forth and proved.'

Whoever has occasion to visit the Library at Lloyd's, among the up-stairs apartments at the Royal Exchange, will there see something which serves as a memento of the *Lutine*. A table and chair have been made from the old broken rudder, which was fished up in 1859, and bears an inscription recording the wreck of the hapless vessel. On the table is placed the ship's bell, weighing about eighty pounds, and in excellent condition; it is stamped with the name 'Saint Jean,' and with the crown and arms of Louis XVI. of France, the sovereign to whom *La Lutine* originally belonged. The bell will never again tell the hour to any ship's crew; nevertheless, it is an interesting though silent witness to an eventful catastrophe recorded in the annals of a period seventy-seven years back.

DASHMARTON'S LEGACY.

CHAPTER II.

In the prospectus which Lucy put forth regarding her school project, one of the referees was the Rev. Tresilian Whitwick, M.A., of Frieldenden Lodge. She had humbled herself to ask this favour of him, and he had graciously consented. As to what had passed, however, between Mrs Whitwick and herself on the day of her father's death, she heard not a word more. That lady studiously ignored the whole subject, and Lucy did not desire to bring it to remembrance. Under present circumstances, it would have been a great temptation had she been offered a good home at the hands of Tresilian;

but she was glad to be spared the temptation, though the thought was a bitter one that she was deemed no more worthy of his attentions.

Alfred Harvey had not returned yet—having been away nearly four months. It would be the same with him, no doubt; she could not expect anything else. She had discouraged him in the palmy days of her prosperity, and she had no reason to imagine that he would continue a hopeless suit under such altered circumstances.

Spiller had made one attempt to obtain employment. He had penned a formal letter of application to the trustees of the Chilprune estate for the agency vacant by his father's death. Old Lord Tancerville, who was one of the trustees, was rather pleased with this letter, and would have helped the youth if he could. But Elkins, who had a good deal to say in the matter now, as a confidential adviser, set his face strongly against it. Thus Spiller was informed that the trustees had made other arrangements, and were unable to entertain his application; and so this outlet was finally closed against him.

After this, the brother became a source of much anxiety to the sister. The little house she had taken at Frieldenden was of course his home, till he could get something to do. One thing he had learned thoroughly in his university career—namely, to play billiards. The *White Hart* at Frieldenden boasted a well-attended billiard-room, where pool went on almost every night, and Spiller's skill at this amusement brought him in a considerable amount of pocket-money. This involved late hours and a good deal of general discredit, and did not redound to the advantage of the young schoolmistress's establishment, as Lucy bitterly felt and deplored. But she could do nothing with Spiller now—her influence over him seemed altogether gone—she saw him gradually sinking lower and lower into the character of a mere tavern-haunter, and she could do nothing to help him out of the mire. At this juncture she heard that Alfred Harvey was coming home.

It was night, and Lucy Dashmorton was in bed, and almost asleep, when the dog-cart went past that brought Alfred Harvey from the station. There was a little pleasant excitement in the knowledge that he had really come home, and yet well, Alfred Harvey was one of those men who are perhaps most lovable at a distance, when their sterling qualities shine forth through the rough outer coating. She had become almost fond of Alfred as long as he was in America; but now, with his harsh voice and uncounted ways, she felt that she would at once become disenchanted.

Spiller had not come home yet. He rarely came home till the billiard-room at the *White Hart* had closed its doors for the night, which was between one and two o'clock, usually. Spiller was gradually developing a mania for gambling. His sister saw it, but was helpless to prevent it. There might have been not so much harm, if he had kept to billiards; but there was a little room leading out of the billiard-room where it was said games of even greater risk were indulged in on occasions. Amongst the occasional frequenters of this little back-room was Mr Whitwick, the father of Tresilian, who, although in a general way kept tightly in hand by his wife, continued to break loose now and then, and indulge his favourite

passion; and the story went in the town that he had lost twenty pounds to Spiller Dashmorton in one night, and that his wife had found it out, and was dreadfully angry.

Altogether, Lucy had a fair share of trouble and vexation of spirit to occupy her mind in the night-watches, when she was in a wakeful mood. To-night, she was especially wakeful. Harvey's return had banished sleep for a while, and, now that she sought to bring it back, it would not come to her. So she heard the clocks strike twelve and one, and at about half-past one, footsteps approached the door. It was Spiller returning, no doubt. He and a companion, it seemed, with whom he was talking. The voice of the latter was raised rather loudly, and it seemed as if Spiller were trying to soothe and conciliate him.

'Well, good-night, old fellow,' said Spiller as they reached the door. 'You'll find that all right in a day or two.'

'You'll find yourself all wrong, if it isn't,' was the reply, in a tone more menacing than friendly; and the speaker turned on his heel and departed.

Spiller was down in time for an early breakfast, for a wonder, next morning; and Lucy hailed the fact as one of encouraging promise; for her wayward brother had got into the way of lying in bed till one or two o'clock in the afternoon. He was as well there perhaps as anywhere else, but Lucy with her active habits thought such laziness quite sad and unnatural. His object, however, in this early rising was to have some talk with his sister before she went in to school.

'I met a man last night,' said he, 'who knew a lot of my Cambridge friends indeed, he has come over here partly to see me.'

'The one who came to the door with you last night?'

'Yes,' said Spiller, a little confused. 'Did you hear anything he said?'

'Nothing—except that he seemed put out with you about something.'

'Why, the fact is,' said the youth, rushing into the middle of his subject, 'I owe him some money—and he's dunning me for it.'

'How much is it, Spiller?' asked Lucy faintly.

'Well, fifty pounds would pretty nearly square it.'

'Fifty pounds!' cried Lucy, in dismay. Then after a pause: 'Well, you can't pay him, Spiller, and you had better tell him so at once, fully and fairly, and not delude him with false promises. What chance have you of getting fifty pounds "in a day or two"?''

'Then you heard that,' said Spiller, assuming an aggrieved air. 'I didn't think you would go eaves-dropping like that.'

'I heard it, because I could not help it,' said Lucy. 'Why don't you tell your friend at once that we are ruined, and haven't got a halfpenny in the world but what I may earn at this poor school.'

'You could borrow the money from Mrs Whitwick,' suggested Spiller. 'I know she would lend you it, you are such a favourite of hers.'

'I shall do nothing of the kind; I shall not borrow money for such unworthy purposes, even if I could.'

'Not even to save your only brother from prison?'

Lucy shook her head.

'Nor even from self-destruction?'

'I don't fear that,' said Lucy. 'You are too

fond of yourself, Spiller, to have any promptings that way.'

'I don't know,' replied the young man; 'I should have a good example before me if I did, and upon my honour that seems the only way out of it.'

'What do you mean by a good example?' inquired Lucy, trembling.

'I mean a good example,' replied Spiller, mockingly. 'Are there not all kinds of examples in history? Cato and Brutus, and lots of fellows.'

'You didn't mean that,' cried Lucy, bursting into tears; 'you meant to wound me about poor papa. But I tell you it is false; and every one knows that it is false. Was there not a long investigation, and did not everybody exonerate papa?'

'Yes; that verdict was conclusive, certainly,' assented Spiller, getting up, and beginning to whistle carelessly as he arranged his necktie at the little pier-glass. 'Well, I'm going out now, Lucy, and if I don't come back, you won't be uneasy. I shall be a good riddance for you, after all.'

'Don't talk like that,' cried Lucy, going to him and throwing her arms round his neck; 'don't make life harder for me than it is. You know if I had that money you should have it, even if I worked myself to death to make it up. But I haven't it, and I can't get it.'

'Haven't you any money at all, Lucy? Not a five-pound note even, as a sop to stay the fellow for a while?'

'Look here!' said Lucy, opening her desk, and shewing Spiller the receptacle where she kept her money. 'Here are thirty shillings. It will be three weeks before I get any money from my pupils, and even then I can't count upon it; and here is what is left to keep us. Take it, if you will.'

Spiller shook his head. 'That's no good,' he said. 'But for all that, I think you could borrow some. I know somebody who would let you have a hundred, in a minute.'

'Pray, who?' asked Lucy, with heightened colour.

'Why, Alfred Harvey. He came home last night, and he'll do it in a minute for you.'

'What! "the common cad"?''

'Was that what I called him?' asked Spiller, with a forced laugh. 'Well, upon my word, I was right; he is an odious cad. But circumstances alter cases. Tresilian has declared off, and'—

'And you would sell your sister to pay your debts! Thank you, Spiller; I know what brotherly affection is now,' she cried with a sob.

'I would do as much for you, Lucy. But I shan't ask you again. It is all U P with me now—very well, let it be U P.'

'But, Spiller,' cried Lucy—the clock had just struck nine, and the murmur of voices and shuffling of feet were heard from the schoolroom—'promise me, dear, don't do anything rash. What I can do for you, I will. But I must have time to think. You won't give way to despair, dear brother; remember you are all I have left now. Promise.'

'Well, I promise you I'll not do anything desperate either to-day or to-morrow—after that, I don't know,' said the obliging youth.

So Lucy was fain to be content with this, and went off to her schoolroom, whilst Spiller strolled away to the *White Hart* to face his unwelcome visitor.

Morning school had come to an end, the children had all departed, and Lucy had retired to her little parlour to think over her brother's troubles. Ah, that fifty pounds—if she had it, and for her own purposes, how much she might do with it. With a little, a very little capital, she could take a larger house and have boarders, and in that way she might form the nucleus of a really good, paying school. But Spiller stood in the way of that too, even if she dared adventure it. She could not turn him out of the house, and yet with such an inmate she saw clearly that a boarding-school was impracticable.

Here she heard the outer gate swing to, and a heavy, quick tread upon the garden walk.

'Please, m, a gentleman to see you,' announced Emily, the little maid, next moment. And in walked Mr Alfred Harvey.

'You see I've kept my promise,' cried Alfred, taking her hands and squeezing them till Lucy was almost breathless with pain. The first greeting in coming home, the last going away. 'Well, how are you getting on?'

Alfred was decidedly not improved in appearance, thought Lucy, by his American expedition. He wore a tall Yankee silk-hat, which did not suit him at all; and his once bushy beard had been pared and trimmed after the billy-goat fashion; and then he had taken up a little of the Yankee twang, which, added to his own natural burr, had an unmusical result.

'You are not looking amiss, Lucy,' said Alfred, shaking her hands again, and looking into her face with his head leaning first on one side, then on the other. 'No, considering all things, you seem to have kept your health pretty well, thank God.'

'Yes, considering all things,' said Lucy with a sigh. 'Of course you have heard all about us?'

'Yes, yes,' said Alfred. 'Terrible bad job that—terrible bad job. Didn't hear of it, though, till a month ago, right in the Far West; and I've been travelling homewards ever since.'

'Did you have a good passage home?' asked Lucy, to break an awkward pause of silence that followed this announcement.

'Middlin,' said Alfred absently. 'Yes,' he went on, 'I came over as quick as ever I could, after that—as quick as ever I could. Well, I'm glad to see you looking so well, Lucy.'

There was another awkward pause, during which Alfred still continued to gaze on Lucy with an admiring but undecided air.

'I have got a nice little school together, you will be glad to know,' said Lucy desperately; 'in fact, I have succeeded better than I could have expected, for a first quarter.'

'Ah, next quarter we shall do better—yes, yes,' repeated Alfred, shaking his head, still in an absent-minded way. Another pause of stillness succeeded.

'Well,' he continued after a while, stretching out his arms as if he were about to grapple with a sack of wheat. 'I've got this job to do, and I must do it.—Lucy, I don't want to harrow up your feelings, not to harrow 'em up without occasion; but what I want to ask you is this: do you remember my coming to say good-bye, the night before I sailed?'

'Yes; of course I remember that.'

'Very well. And you know that I had a long talk with your poor father before I went away?'

'Yes; I recollect that too.'

'Well, the subject of our conversation was—Miss Lucy Dashmorton. Says I to your poor father: "I'm going away for two or three months, and perhaps longer, and nobody knows what may happen in that time. Now, before I go, I want to make it right with your daughter Lucy." Your father took me by the hand, and says he: "Alfred, you have my best good wishes." Well, I needn't tell you what he said about me; anyhow, he thought me fit to be his daughter's husband. But he said: "Alfred, don't you speak to her before you go; the girl is unprepared for it, and you'll get perhaps an answer you won't like; but take my word for it, Lucy likes you well enough; and when you are gone, she'll begin to find it out. Now you promise me?" Well, I thought the old man was right, and I promised. But I pretty nigh broke my promise, I can tell you, when I stood beside you at the gate and said good-bye. What would you have said, Lucy, if I'd taken you in my arms then and there, and given you a hundred kisses?'

'I should have been most indignant,' returned Lucy proudly. 'Please don't talk so absurdly.'

'Well, you'd a narrow escape of it then,' said Alfred; 'but your father came along, and we drove off together. Well, I was to put him down at Ashley-hurst, and so I did. "Alfred," he said just before I pulled up, "life's uncertain, and you and I may never meet again. I've written a letter here for my little girl, and I give it you to take care of. When she reads that, she'll know what her father's wishes were; and depend upon it, Alfred," he said, "they will go a good way with her; only you must promise me two things." "What are they?" I asked. "First, that you'll not trust it into any other hands but yours to deliver; and next, that you'll not come home any the sooner for what I've said to you to-day." "There's my hand on it," said I, and then your father gave me the letter; and here it is,' continued Alfred, producing from the breast-pocket of his coat a little packet carefully wrapped up in brown paper. 'There it is, Lucy. It's been with me wherever I went, speaking hope and comfort. But I know that you must feel it a good bit, through what has happened since, so I shall leave you to read it by yourself. I shall come for an answer to-morrow. I'm going to see father and mother now, Lucy; so good-bye.'

When he was gone she averted her head, and tore open the letter: and as she did so, something light and rustling fell from the envelope to the ground. It was a Bank of England note for five hundred pounds.

The letter of John Dashmorton to his daughter was short and hurried, written in an almost undecipherable scrawl; but after a little difficulty, Lucy made out the following:

MY DEAR DAUGHTER—Alfred Harvey is a good fellow; marry him if you can; make up your mind to it, dear. Inclosed is what I could save out of the fire; it will buy you gowns and ribbons if you marry, or keep you a little while if you don't. Lucy, you must take it: all I could save. It was your mother's money; she brought me as much as that when we married. Keep it, dear, promise me; and let no one see this letter, as you value your father's blessing. Good-bye for ever and ever, my own dear daughter.—YOUR UNHAPPY FATHER.

There was a blister on the sheet, as if a hot

despairing tear had been dropped upon it. Lucy pressed the blotted scrawl to her lips, to her heart. There was no doubt in her mind now—none. Her father had done this dreadful deed; he had destroyed his own life. That letter and the circumstances attending it would prove as much to any one who read it. No one must ever see it, or know that he had sent her that money.

What care he had taken in all his troubles that the money should reach her, and in such a way that she could hardly refuse to avail herself of it! Had it been left in her hands before his death, she would have given it up, of course, to the managers of the Chilprune estate, to reduce the amount of defalcations. But could she do this now without explaining all the circumstances, and revealing to the world that her father had been a suicide, and, as every one would say, a robber? It was a cruel position to be in. Then there came upon her the thought of how much this money would do for them. It would set her up in a way of making a good living; it would give Spiller another term at Cambridge, where he could take his degree; and then, who knows but he might take orders, and become a respectable curate in some country parish, out of the reach of temptation and bad company.

Lucy could not make up her mind what she ought to do. She would do what was right, if she could only find it out. But what *was* the right? The estate had seized everything it could lay its hands on. They had given up everything that their father had left behind; and this money, that had come in this unlooked-for way, that had been her mother's dowry too, was it not rightly if not legally hers? Would it be any consolation to her, when she had given up this little capital which would be salvation to them, to swell the hoards of the little Lady Chilprune, when she saw her brother sinking step by step into a mere tavern-haunter and gambler, herself toiling on, losing heart and hope, earning just enough to save them from starvation, or hardly that? Would it be any good to her, having wrecked both their lives and sullied her father's memory; that she might ling herself upon the possession of a superfine sense of honour, that perhaps had its root only in an exaggerated personal pride?

Spiller came in presently, and informed his sister that he was going to dine with his friend that afternoon in the *White Hart*, but that he would bring him over afterwards to partake of coffee.

'You are still on friendly terms with your creditor, then?'

'O yes, we are capital friends; only, he wants his money, and will be in a desperate state without it.'

'I had much rather you brought your friends here than spent the evening playing cards at the *White Hart*. That is, if they are respectable. Is he respectable, this friend?'

'Highly so,' said Spiller; 'he's well connected, and very pleasant in innner. I think you'll like him, Lucy. By the way, hasn't Alfred Harvey been here to-day?'

'Yes,' replied Lucy shortly.

'Oh, you didn't try that on, eh? The matter of the loan?'

'No, I did not; I said not a word about it.'

'Then you are still determined to let me go to prison?'

'Now tell me, Spiller,' said Lucy, with an expression of serious determination on her face, 'if you were to get this fifty pounds, would that clear you of your debts?'

'Why, not quite; but there would be nothing pressing: the rest would do at any time.'

'And how much would it take to complete your terms at Cambridge, and pass your B.A.?'

'Well, a hundred and fifty would do it comfortably.'

'And if a friend, a kind dear friend, found this money, would you promise to give up all this gambling and public-house work, and take orders, and become a decent respectable man?'

'Indeed, I would,' said Spiller eagerly. 'Don't think I'm fond of the life I'm leading—I hate it. But what can I do? I should go mad, to sit at home all day long and think of past and future. Give me but a chance; let me but see my way. Lucy, I'll read, I'll study, I will never touch card or cue again.'

'Dear boy,' cried Lucy, kissing him affectionately. 'I knew there was good in you, Spiller, and that you would work through your little follies. When would you begin this new course of life?'

'When I get the money,' said Spiller cautiously.

Lucy sighed, and turned away. The money was locked up in her desk. Should she tell him? No; she must have time to think it out.

'Don't build upon it, dear brother, for I don't know how far I have been justified in talking of this dear kind friend. It is all in the clouds, you know—as yet.'

'Well, whatever is done,' said Spiller gloomily, 'must be done quickly, if it's to be any good. Once I'm blown upon, and it's all U.P.'

The afternoon was a half-holiday as it happened; and Lucy had made up her mind to walk to the little church of Tattenden, about a mile and a half distant by field-path. It was to this parish that Mordien belonged, and there in the churchyard had John Dashmorton been buried.

It was winter now—dead winter; there was a thin coating of rime upon the ground, and the snow lay in patches under the hedges. The foot-paths were hard and frost-bound, and crackled crisply under the tread. Day was drawing in fast. Already, only an orange patch in the horizon shewed where the sun had sunk to his nightly rest. Here and there a star was twinkling with pale-yellow gleam in the vault overhead, that had here a sea-green tinge, and was there darkening into purple.

It was almost dark as Lucy entered the churchyard, all silent and tranquil, where the dead so quietly slept. She had hoped that in her walk some revelation might have come to her of the course she should pursue; but she stood still undecided by the side of her father's grave. Lucy was shocked to see how bare and neglected it looked, as if belonging to one upon whom a secret ban had been set. The turf above it was brown and withered, showing here and there rents and seams in the frost-bound earth beneath. No headstone had been put up as yet; there had been no time to think of that—and no money indeed. This should be seen to at once, said Lucy to herself. His grave should not lie neglected and bare, like that of some homeless wanderer or nameless suicide. Ah! what a bitter thought it was—of her father's life and death! What evil had he

done to any man, that this should be the end? Was he not always kind, considerate, a friend in need, a help to the widow and fatherless? A genial, hospitable man indeed, but an enemy to riot and excess. He had squandered no money in riotous living, had never ground the faces of the poor, nor made a market out of their distress. It was to provide more handsomely for his children, that he had been led to speculate, misled by artfully luted falsehoods and lying promises. Then he had grown desperate with losses, had plunged deep and deeper still, losing money too that was not his own, and thus made an end of all. This was a daughter's estimate, that perhaps left out many things that weighed heavily against him. But she was not the one to reproach him. There was nothing in her heart but blessings for him, could they only reach him—could they only penetrate this cruel frozen earth, and whisper comfort to him in his last long sleep.

The orphaned girl was turning away sadly, her mind still full of doubt and uncertainty, when she heard distant voices, the owners of which were invisible, but who appeared to be approaching by the very path she would have to traverse. Shrieking from observation and casual greetings, she retreated into the church porch, a favourite resting-place on hot Sunday afternoons. As the persons approached, Lucy thought that one of the voices was familiar to her. Yes, one of the talkers was Elkins the auditor. The other voice too, she thought she had heard before; and then she remembered that Lord Tancenville was expected down about this time, and came to the conclusion, rightly, that it was he who was Elkins' companion.

'Ah! a pretty scene this,' said his lordship, coming to a stand just opposite the porch, where a gleam of light was still visible in the west, throwing out the dark-blue distant hills, and repeated in the mirror of a little stream that made a shallow reach just below. 'A very pretty scene! The light glimmering in the cottage window, the smoke curling up against the wood.'

Now fades the glimmering landscape on the sight.'

'Yes,' said Elkins, shivering a little; 'very pretty, but chilly.'

'Well, to resume,' went on Lord Tancenville, striking his stick nervously once or twice on a grave-stone. 'You think it necessary to watch these young people still?'

'I do certainly, my lord. I still adhere to the opinion that the man made up a purse of some kind and left it behind him. It is not likely that the children would make anything but a show of poverty at present; but it will come out by-and-by, when everything has blown over.'

'Well, well,' said his lordship, walking on once more, 'if you think it necessary.'

'Why, look at the young man,' said Elkins, 'squandering money every night at billiards and so on; does that look like real poverty?'

'As far as my experience goes, it does,' replied Lord Tancenville.

'Well,' said Elkins, 'time will shew who's right. I've managed to put the screw on the young gentleman pretty tight, and now we shall see if he goes to the secret hoard.'

Further conversation became inaudible as they passed on; and Lucy crept out of her hiding-

place trembling all over with a kind of guilty terror.

They were watched then, thought she; there were spies about them; perhaps during her absence the house had been entered and searched; perhaps the bank-note had been discovered, and seized as evidence; perhaps they were waiting to arrest her, to carry her off to prison, as a receiver of stolen money!

She hurried breathlessly home, anxious to know the worst; but everything was quiet and undisturbed at the cottage. No one had been, said Emily, the little maid. The bank-note was safe in its receptacle. It must stay there no longer, however. But where to put it? It would not be safe on her own person, for she might be arrested and searched. She could not venture to hide it anywhere in the house, for she had a sort of superstitious estimate of the power of detectives, and believed that they would find out her place of deposit as if by instinct. Before she had come to any decision on the matter, Spiller and his friend appeared at the garden gate. She hurriedly placed the note in her pocket, thinking that after all it would be safer there; but she left her father's letter in her desk.

LA CROSSE.

THE newspapers told us some time ago that 'a Canadian team are about to visit England, to display their skill at La Crosse;' and the arrival duly followed the announcement. The uninitiated amongst us have hardly yet become familiar with this use of the word 'team;' but we are learning it by degrees. A 'team' of cricketers went out to Australia; a 'team' of riflemen came over from the continent; a 'team' of oarsmen crossed the Atlantic to challenge a 'team' in the American rivers; and 'teams' of polo-players contend for the honours at Hurlingham.

A few remarks on this word 'team,' before we proceed with our immediate subject. Although thus applied to parties of competitors, each party comprising a definite number of colleagues, the word was undoubtedly first used in reference to wagons and horses; and a most curious question arose about a dozen years ago, whether a 'team' means the wagon as well as the horses, or the horses only. A farmer in Oxfordshire agreed to a clause in his lease, whereby he bound himself to render a certain number of days 'team-work' for his landlord every year, at any season except at hay or harvest time: the team to consist of 'two horses and one proper person.' The landlord (one of our Midland nobles), or his bailiff, one day requested the farmer to send a cart to fetch coals from a railway station to the dual precincts—as part of the service to be rendered in lieu of a portion of rent. The farmer agreed to send the horses and a man, leaving the bailiff to provide a cart or wagon. The bailiff expostulated, and pointed to the 'team-work' in the lease. 'Well, here's the team,' said the farmer. 'No; they are only the horses; there can't be a team without a cart or wagon.' 'Nonsense; the horses are the team.' Both parties were obstinate; and as neither would yield to the other, the majesty of the law was appealed to. An action of ejection was commenced by the nobleman against the lessee, for refusing to fulfil a condition or

proviso in the lease; and a common jury gave a verdict against the farmer. Determined not to be beaten, except after a good fight, the farmer appealed; and the judges at Westminster went fully into the matter. They quite enjoyed the episode, for it gave them an opportunity to rake up their stores of knowledge concerning the old English meaning of the word 'team,' and to argue the matter with the counsel on both sides. Caesar, writers of the mediæval times, Spenser, Shakspeare, Roscommon, Dryden, Gray, Wordsworth, Johnson, Walker, Richardson, Bosworth—all were brought into court. It was found that neither plea could really upset the other; two judges decided for the farmer, and one for the duke; and we believe some kind of compromise was arrived at, due to the conflicting use of the term by celebrated writers.

At anyrate, the Canadian players of *la Crosse* may well contend that they need no wagon or cart to constitute *them* a 'team'; for, does not sweet Spenser apply the term to a group of graceful swans?

Like a long team of snowy swans on high,
Which clap their wings and cleave the liquid sky.

The game of *la Crosse* is so old in America that no one can assign a date for its origin. It was played by the Iroquois and other tribes of Indians far more than a century ago, seeing that it was learned from them by the French Canadians before the English conquest of that part of the American continent. Montreal was once its headquarters, from whence it has travelled west to Toronto; and it is now played alike by the white man and the red man in those regions. When the Prince of Wales visited Canada in 1860, he witnessed the playing of a game, and was elected an honorary member of the Montreal *la Crosse* Club. A team of Iroquois Indians came over to play the game in England in 1867; a little attention was paid to the subject, and *la Crosse* Clubs were established at Blackheath, Richmond, and a few other places; but it cannot be said that the game succeeded in naturalising itself in this country. When Prince Arthur (now Duke of Connaught) went to America, he, like his eldest brother, saw the game played by Canadians and Iroquois, and, also like him, was elected an honorary member of the Montreal *la Crosse* Club. When the public journals announced that a team of Canadians and another of Iroquois intended to visit England, in order to teach us Britishers how to play the game, the announcement was welcomed; for many advocates of healthy open-air sport wish to see *la Crosse* taken up by our public schools.

La Crosse may be put into comparison with several other sports as a mode of illustrating its character by resemblances in some particulars and differences in others. It partakes a little of cricket, the one having goals and the other wickets; and a little of racquets and racquet tennis, the former having battledores and the latter racquet-bats. It partly resembles football, in the struggle of many players to get close to a ball; in some degree polo, for the same reason; and in a still greater degree hockey, or, as it is termed in Scotland, shinty, in regard to the general mode of play. But it has characteristic features of its own distinct from all these.

There is only one ball used in the game, but as many battledores or bats as there are players.

The ball is smaller than a cricket-ball, eight or nine inches in circumference, and four ounces weight; it is made of india-rubber in what is called the 'spongy' state, solid rubber being too hard for the purpose. The battledore consists of a kind of network-spoon at one end, with a handle of light hickory, and is nearly six feet in total length; it is usually held in play—not with one hand as the racquet-bat—but with two as the cricket-bat or the croquet mallet. The netting which forms the lower end of the battledore consists of strings of catgut (strings of deerskin as originally constructed by the North American Indians), stretched across a pear-shaped frame in opposite directions, with sufficient looseness to allow the netting to assume a somewhat hollowed or concave form, approaching to that of a spoon or scoop. The battledore is called by the Canadians the *crosse*, perhaps in reference to the crossed strings of the netting; and the game seems to have hence derived its name. The goals or wickets are posts or poles about six feet in height, with small distinguishing flags; the red goal, belonging to one team or party, near one end of the field, the blue near the other end; each goal consists of two of these posts, placed six feet apart.

The field and the fielding are not so definitely prescribed in *la Crosse* as in cricket. In the latter, allowing for occasional exceptions, there are eleven players on each side; all the eleven on one side, and two on the other (the batsmen), are engaged at once; the wickets are a definite distance apart (twenty-two yards or sixty-six feet); and there is something like an approach to uniformity in the size of the field or playing-ground. In *la Crosse*, on the contrary, the number of players, the distance between the goals, and the size of the field, may be varied considerably without affecting the general character of the game. The greater the number of players, the more elbow-room they require. As little as a hundred yards, as much as a mile, have been named as extreme limits to the length of the field. All the players on both sides are engaged at once, and very energetic exertions they are called upon to make. Each team has its captain, who directs the positions and movements of all the other players. As the incidents of the game bring many of the players pell-mell together—now here, now there; now (to the somewhat bewildered eye of an uninitiated spectator) everywhere at once—the opposing teams require to be distinguished by some predominant colour, say red in the one case and blue in the other, in their caps, vests, leggings, or other outer garments; the light blue and dark blue of the Cambridge and Oxford University rowing-crews would probably not be distinctive enough.

The field or ground is prepared for play by setting up the red and blue goals, at whatever distances apart may be agreed on; each goal (as we have explained) consisting of two upright posts, and each post surmounted by a small flag, red or blue, according to the side to which it belongs. Each team is subdivided and designated according to the duties to be fulfilled by the several players. One, the *goal-keeper*, or *goal*, stations himself near his goal, to prevent the ball, if possible, from passing through it; a second, known as *point*, is placed somewhat in front or advance of the *goal-keeper*; a third, the *cover-point*, still farther in

advance; a fourth, the *centre*, takes his place near the middle of the field; a *fifth*, receiving the appellation of *home*, is the farthest removed from the goal, and the nearest to the enemy; while all the others, whatever their number may be, are *fielders*, who rush about to all parts of the field according to the exigencies of the game. A good hold of the ground is necessary for the swift movements of the players; spiked shoes are not allowed, but a kind of moccasin is found to be well suited for the purpose.

Such being the preliminary arrangements, let us now watch the playing of a game. The object of each team is to drive or throw the ball between the posts of the enemy's goal; if this be accomplished, the game is won. The keeper of each goal therefore encourages his colleagues to frustrate any assault upon their goal, while vigorously maintaining an attack on the enemy's. The ball, placed at first on the grass in the centre of the field, becomes truly a creature of circumstances, a sport of fortune; driven hither and thither, never quiet for a moment, but at the mercy of reds and blues alternately or (rather) indiscriminately. It is neither struck with solid wood, as in cricket, trap-ball, and croquet; nor kicked with the foot, as in football; nor tossed from the hand, as in toss-ball; nor struck with an elastic bat, as in rackets and shuttlecock; nor struck with the palm of the hand, as in fives and hand-tennis. The manœuvring is peculiar. The ball is scooped up and then carried. The player who succeeds in getting nearest to it, scrapes or spoons it up with the curved edge of his crosse; he holds it horizontally on the slightly-concave netting, and runs forward swiftly but steadily. If he can nearly reach the enemy's goal, and throw the ball between the posts, he wins the game for his side. But this is just the thing that the enemy won't permit. Supposing the player who has the ball at the instant to be red, he is beset by one or more blue fielders, who dodge his steps, and endeavour to knock the ball off his crosse. It is his turn now to frustrate the blues; when he can no longer keep the ball in safety, he dexterously throws it off his crosse not at random, but in some direction where a colleague or colleagues happen to be at the moment. A first-rate throw sometimes reaches two hundred yards; but usually the distance is much less than this. And so the game goes on; the reds watching every chance of driving the ball through the blue goal, and the blues defiantly seeking a directly opposite result.

Many conditions have to be observed for the due playing of the game. The ball must not be touched with the hand, except under a few clearly defined exigencies. The players must not come into personal conflict, by striking, kicking, grasping, or tripping up; no one may lay hold of the crosse held by another; the assilant crosse only must touch the ball, or the crosse that supports it, in the endeavour to sweep it off. In doing so he may, and often does, accidentally strike his adversary's person, but not avowedly. It is not requisite that the reds and the blues shall attack the ball alternately; two or more players on the same side may successively have command of the ball, without giving an intervening chance to the other team. Incautious throwing of a ball may bring the team to grief; if driven through the red goal by a red player, it is just as fatal to the

reds as if thrown by one of the blues—like as a cricket batsman may clumsily stamp himself out at his own wicket. The player who is carrying the ball on his crosse at any particular moment may hold it high up or low down, straight forward or a little inclined to the right or left while running; but he must mind his *Ps* and *Qs*, for if he accidentally lets the ball fall to the ground, there are sharp-eyed and nimble-footed antagonists ready to take advantage of his mishap. Sometimes a skillful player, when closely pursued, will throw the ball off his crosse upward and backward, then rush past the enemy by a return flank movement, and regain command of the ball before the enemy can look about them. Where the field is large and the players numerous, one single game may last for hours, involving an amount of hard running not easy to estimate.

The players from across the Atlantic, already mentioned, comprise about thirty men, in order to insure twenty or twenty-four for each game. The Indians give themselves the fanciful names of 'Deerhound,' 'Wild Wind,' 'Great Arm,' 'The Loon,' 'Flickory Wood-split,' &c.; whether these are their real names, we need not inquire too curiously. The fielders are subdivided into *first field*, *second field*, *third field*, *first home field*, *second home field*, *third home field*, &c. The Canadians or whites have a dress mostly white; while the Indians or reds disport themselves in picturesque red and white stripes, with a slight dash of the semi-barbarian about them. At Edinburgh, among other places, they adopted a goal-distance of about three hundred yards apart. The incessant activity of the players, with none of those hulls which characterise cricket, keeps the spectator also on the *qui vive*; and he must possess tolerably good eyesight to see how the more distant tussles are going on. As to the players themselves, if watchfulness of eye, steadiness of nerve, promptness of muscle, readiness of resource, fleetness of foot, are useful aids towards obtaining that *mens sana in corpore sano* so much recommended to us—then our young men might do well to familiarise themselves with the game of *La Crosse*.

GUARANA.

GUARANA-BREAD, as it is called by the Brazilian Indians, has some properties worthy of being known. It is the product of a small climbing shrub, growing chiefly in the northern parts of the empire, and on the banks of the Amazon and its tributaries, known among botanists as the *Paullinia sorbilis*. The plant ripens its seeds about October or November. They are then gathered, peeled, dried, and stored away until wanted for conversion into guarana-bread. The manufacture is of the simplest. After being slightly roasted, the seeds are reduced to powder by means of a coarse file, and the powder worked into a stiff paste with water; a certain proportion of whole and broken seeds being mixed with the mass before it is moulded into oblong cakes or cylindrical rolls; looking when dry, like chocolate-coloured sausages. If they are of a dark-brown hue, it is a sign that the seeds have been over-roasted; in which case, the guarana loses both flavour and efficacy, and fetches, of course, a lower price in the market.

Munteguza pronounces guarana to be without

a rival as an aliment for travellers, its virtues being unaffected either by heat or damp, putrefaction or time; while it is available for service wherever a draught of water is procurable; for, unlike tea, coffee, and cocoa, guarana needs only to be mixed with cold water to furnish a refreshing, sustaining beverage; which, by the addition of a little sugar, is rendered as palatable as it is stimulating, leaving its grateful flavour a long time in the mouth. No wonder the Indians of the Amazon consider guarana-bread an indispensable necessity when journeying far afoot, especially indispensable, seeing they think it a panacea for diarrhoea and dysentery, and credit it with making tongue-tied folks eloquent.

We are assured that there is nothing in the world so healthful and so reinvigorating as a cup of fresh guarana, its stimulating properties far exceeding those of coffee or tea; but like all stimulating drinks, guarana must be indulged in judiciously. Taken immediately after a meal, it is apt to derange the digestive functions; and if the drinker mixes his cup too strong, or imbibes too freely of the beverage, it produces over-excitation, inquietude, and wakefulness, and destroys the appetite.

Guarana is scarcely destined to obtain a place among European, much less British beverages, but it may possibly find favour as a remedial agent in nervous ailments. Dr Leconte, a French physician, enrols it as a specific in cases of sick-headache, one of the most obstinate complaints with which doctors have to deal; and writing to an English medical journal, says: 'I feel myself justified, as well by my own experience as by that of many physicians of my acquaintance, in affirming that this medicine never fails, except when improperly prepared, adulterated, or injudiciously administered.' To be properly prepared, the rolls of guarana should be pulverised, and then treated with alcohol, dried and reduced to powder; to be administered in doses of two grammes, a second dose following at an interval of a couple of hours, if the first fails to produce the desired effect. Dr Wilks, if not quite so enthusiastic as his French brother, speaks favourably of the new remedy, deposing that one lady-patient of his contrived to keep her old enemy at bay for half a year by its aid; and that another wrote to him: 'When you prescribed guarana-powders for me for severe and frequent headache, you asked me to let you know if I found them beneficial. I have every reason to believe them a complete preventive of headache; as on the least symptom, I have taken a powder, sometimes a second in two hours' time; and in no case have they failed as an effectual cure.'

Spite of this testimony to the merits of guarana, it may be doubted whether those who have recourse to it will not find it lose its power after a while, if it does not prove harmful in the long-run. The writer happens to know by painful experience what sick-headache is, and he also happens to have found a preventive, at least in his own case: the very simple one of abstaining from tea altogether, and taking coffee, pure coffee, morning and evening. Having enjoyed a twelve-month's freedom from headache, he is impelled to advise all sufferers that way to imitate his example before trying the vaunted guarana of Brazil.

SONGS OF THE OLDEN TIME.

THE COUNTRY LASS.

This old English and scarce ballad dates from the seventeenth century; the air to which it was sung being that now adopted for *Sally in our Alley*. The author is unknown. Some of the lines bear the peculiarity of having an additional syllable, 'a,' to make out the metre, as was not uncommon in old English ballads. As originally written, *The Country Lass* would scarcely be fit for singing in modern times. In the following version some changes are introduced; otherwise, the ancient ditty is preserved.

ALTHOUGH I am a country lass,
A lofty mind I bear-a;
I think myself as good as tho'
Who gay apparel wear-a.
My dress is made of comely gray,
Yet is my skin as soft-a
As those who, using choice perfumes,
Do scent their garments oft-a.

At times I keep my father's sheep,
A thing that must be done-a,
A garland of the fairest flowers
Oft shades me from the sun-a.
And when I see them feeding by,
Where grass and flowers spring-a,
Close by a crystal fountain clear,
I sit me down and sing-a.

I take my part in household work,
I card,* I sew, I spin-a,
I milk the cows at early morn,
Kind Robin's smile I win-a.
I bake and brew with sister Sue,
My brother's hose I darn-a,
At harvest-time a sickle wield,
And winnow in the barn-a.

My ruddy cheeks with glow of health,
Seek neither paint nor patching,
At church I have my duty learnt,
And need no constant watching.
With Robin at the Whitsuntide
I dance upon the green-a,
While pipe and tabor cheer the throng—
A merry set I ween-a.

I envy not the ladies fine,
With skirts that sweep the ground-a,
Not trained to any useful art,
They're good for nothing found-a.
In idleness their days are spent,
Abroad for recreation,
We simple lasses hate their pride,
And keep the country fashion.

Then, do not scorn the country lass,
Though she go plain and meanly;
Who takes a country girl to wife
That goeth neat and cleanly,
Is better sped than if he wed
A lady from the city,
For there they are so idly bred,
They're only worth our pity.

IDLERS.

FOREST trees have worms at their roots; and rats and mice devour the seeds which would have given the land good harvests had they been suffered to grow; buds have grubs that eat out their hearts and thus prevent the fruit which would have ripened for the summer's joy and the winter's store; and workers have idlers about their paths who set themselves deliberately to interrupt their labours, to destroy their work, and to reduce them to the same level of inanity and uselessness as themselves. They float about the world like clouds of moral bacteria to settle where they can find a suitable place for their own pleasure, at the cost of others' pain. Nothing stops them, and no business is too precious, no work too sacred for them to respect. They want to kill Time—Time that evasive Mercury to the busy, who hangs as heavy as so much lead on their idle hands—Time that light-footed runner whom the occupied can never catch but whom the idle can never pass by—yes, they want to kill Time, the enemy of their happiness and the source of their deepest enmity; but they cannot kill him without a companion to help them. Wherefore they come to you to get your aid in the destruction of that which is your best friend, the sower of your future harvest and the giver of your children's bread, the ground-work of your success, of your fame, of your well-doing—that of which you have not half enough for your needs, and the duration of which you would if you could, increase a hundredfold.

It is in vain that you try to make them understand the difference between your position and theirs. Idleness has other faults beside itself; and there was never an idle person yet, out on the errand of killing Time, who was not selfishly unable to comprehend such differences as interfered with his own desires, and as selfishly determined to accept no denial of what it is his pleasure to demand.

'Not able to go to the theatre to-night, because you cannot give the time? Nonsense! I could have understood the plea of another engagement,

but this absurd excuse is no reason at all! It will be only for three or four hours, and you surely can give that,' says your idle friend jauntily; adding if a man: 'There is no fun in going by one's self!'—if a woman: 'How can I go alone? It is impossible! I must have a companion and you really must come with me!'

You refuse a ticket for this *fête*, for that morning performance? always on the same plea of want of time, and things that have to be done? Your idle friend, transformed by idleness and the imperious need of selfishness into your enemy—and one of the worst that you can have—absolutely refuses to take your 'no' as an answer, and makes your companionship on this occasion a test of your friendship and a condition of its continuance. You have the alternative—either to destroy your day or give up your friend; and the chances are that you do the former, and weakly hold to the latter as a hinderance and obstructive for many other days to come. It would be better if you had strength of mind enough to hold to your word and brave the consequences of your friend's displeasure. But if you have cause of gratitude for past kindness?—if, for some old sentiment, some pleasant association, you are unwilling to break the tie!—well! then you submit to the tyranny, to the loss, to the discomfort, and lay aside your work at the bidding of your friend, to fulfil his caprice and to give him pleasure. By which you simply pull the straps a little tighter and prepare worse trials for yourself—trials which will some day become intolerable, when the break must come and more painfully than it would have come now. As we have said, it is morally impossible to make an habitual idler understand the value of time, and even more impossible to make a rich idler understand your need of work nor how important it is for you to have a stretch of uninterrupted hours if you are to do any good. He cannot take it in and he will not try. A stretch of uninterrupted hours means nothing to him but so much breadth of playground; and he thinks that it should be the same thing to you also. His fortunes are assured, and he cannot realise that yours should be still shaky

and undetermined ; that, while he is living in the upper chambers, you should be merely howking up the foundations. You are his friend, his equal in intelligence, in birth, in breeding—how comes it then that you should not be free as he is to play with your time and give your hours to pleasure instead of work? We know of nothing wherein there is less sympathy, less comprehension, than in this matter of the employment of time : which for the rich means play and for the poor toil.

Then there are the affectionate idlers—the friends who would be far too conscientious to ask you to give up your work for the sake of amusement, but who have no scruple in patting friendship in the same place, and of letting love claim what they themselves would think righteously denied to pleasure. These are the dear souls who will not be turned away, let your orders be ever so strict, your seclusion ever so sacred. ‘Oh ! I am sure he will see me,’ they say with a bland smile and an entreating voice. ‘Take him that card, and say that I will not keep him long ; but I am sure he will like to see me !’

As servants are human beings with impressionable natures, not mere machines that cannot be coaxed, the bland smile and the entreating voice make their mark and oil the hinges disastrously enough for you ; and your work is interrupted, the thread of your ideas is broken and perhaps is not able to be found again, that you may talk bucolics with a dear good prosy old fossil from the country, who has nothing to tell you, between whom and you is no point of common interest, and who, when you have seen him for five minutes—heard that he is well, that his wife is well, that his children are well, and that life generally is prospering with him—has exhausted all that he has to say, and fulfilled the sole defensible reason for his intrusion. But do you think that he will go so soon as he has delivered himself of all this? Not a bit of it ! He has come for a good long talk, and a good long talk he will have. ‘You can spare me a little time,’ he says benignly, when you confess to extreme pressure of business and hint at the importance of your time. ‘I do not see you above once or twice a year ; I do not take up much of your time.’

Very true ; but you have some dozen of friends out in the country like himself, and if they all made the same plea when they come up to London, where would you be then ? Country folks, up in London, and separated from their own business, never seem to have an idea that Londoners can have more to do than themselves. They have come to the great city for pleasure ; and it is incredible to them that all the citizens are not living a life of pleasure too. It is the same when townsfolk go into the country. To them the country is the place of rest, of idleness, of sweet lotus-eating, where the hours are longer and time of not half the value as it is in towns, and where in consequence they cannot believe in the busy duties of their friends. For to most of us our own condition is the condition of the world at large—when we are athirst who can be slaked ? when we are satisfied who can be hungry ? and how can there be busy needs when we have none ? and the pre-occupancy of time which to us is void ?

Of all the thieves of time and hangers-on of idleness, morning callers are the worst. There

ought to be a law by which it should be rendered penal for any one to call on a person of known occupation, save on a matter of business or imperative necessity. The precious golden sands that have been poured into the barren ocean of idle talk by these pitiless wasters of time—these conscienceless destroyers of the best wealth of human life ! They come—radiant, smiling, well dressed and well bred ; perfectly honourable folk and incapable of crime ; but if you told them that they were picking your pocket of so much—making you pay in hard cash so much for every moment of their stay—they would hold themselves insulted beyond the possibility of forgiveness, and would regard you as about the greatest ruffian let loose on society. Yet, put crudely, this is the absolute truth ; and the morning callers who interrupt workers may set down their visits as costing their friends so much and so much—in proportion to the assumed worth of their friends’ work. They would scarcely ask them to pay the same amount in visible silver and gold to give them, these friends, half-an-hour’s pleasure in any other form. But odd things are done under the guise of friendship ; and this of the ruthless destruction of time, the interruption of work, and the practical picking of pockets, is one of them.

Then there are the idlers with a grievance, who come to inflict themselves and their sorrows on you at all hours, from sunrise to sunset, and beyond—you unable to refuse because of the sacred charm residing in that one word Sympathy ; they claiming, and you forced to render. And there are the idlers who, without having any real burdens to oppress them, make up imaginary ones, and out of their mole-hills of inconvenience construct mountains of misfortune which they force you to look at all round and from base to summit, and are angry if you say that they are really only mole-hills after all, and that they need not worry themselves—or you—about them. These are the idlers who haunt your offices, professional men, and will not be bowed out by anything short of curt and stern dismissal. They are sure to be both wonderfully stupid about great points and wonderfully exact in the most insignificant details ; requiring you to go over the ground two or three times, omitting none of the minor points, and profuse if woolly on the major. They are fertile in possibilities, and make you give full and exhaustive replies as to what you would, or would not, do in every kind of hypothetical turn which their case might take. Not that they believe in their own hypotheses, but they have a lot of time on their hands and it makes talk as well as anything else. You all the while are fanning to get rid of them and their insignificant affairs—their law business which a mere copying-clerk could settle—their ailments which the first chemist would cure—their negotiations which a child could conduct and where only a born imbecile would go wrong ; for grave matters are waiting, and your idle talker stands in the way of really important work. What are you to do with such hopeless bores, such immovable obstructives ? Surely our day is vastly too humanitarian ; and a little mild torture might be allowable on occasions !

The grave and fussy idlers who stop you in the street, and buttonhole you in the face of an outrageous sun, in the teeth of an east wind, and on

the way, as you are, 'full pelt' to keep an important appointment; beguiling your attention in the first instance by assuring you that they have something of the greatest moment to communicate—which turns out to be nothing at all when you have heard it; the smiling idlers, capital company when you have time for them, who really must keep you just to tell you this capital joke—which is an old Joe Miller spoilt; those who want to talk to you about Maulstick's new picture, which you must really go to see, you who are so fond of art!—but you dislike Maulstick personally and detest his style as heresy and ugliness combined; those who have heard of the very thing to suit you—a house if you are looking for one, sure to be on the clay if you demand gravel, and to stand to the east if you make a *sine quâ non* of the west; or a horse that will not carry your weight; or a servant who is a cook when you want a housemaid, or a gardener if you are in search for a groom; those who know something about certain common friends which will interest you to hear—and which you have heard more than a month ago; the idlers bracketed with you in the same office, who will neither do their own work nor let you do yours; the idlers who are not forced by the stern necessity of the great Food question to do anything, and with whom duty and the love of employment for its own sake are motives infinitely too weak to stir them from their lethargy: these and more like unto them are the moral locusts of life which go about devouring the leaves and buds of such activities as come in their way—intellectual bacteria swarming in crowds wherever they have the chance to exist, and rendering that society where they do swarm, corrupt and unfit, useless and unwholesome.

Whence do they come, those idlers in the streets who, wandering in single rank or dispersed detachments among the busy and the purposeful, are confounded with them, and never seen for what they are till something happens which calls them together; when they astonish us by their numbers and the problem of how they are able to live at all—idling not being a profitable investment of one's capital? Men and women who, one would suppose, had enough to do to keep things straight, and to find food and clothing for themselves and those belonging to them, if they worked diligently for twelve hours out of the twenty-four, gather into compact masses of gaping idleness at every passing show, every unusual occurrence, every trifling accident; and pass hours staring at the sight, if hours are needed to be passed before the obstruction gets itself removed, or the show vanishes into space. Masterless men surely they must be; yet evidently they are not their own masters, so far as having the whiphand of circumstances goes—women without home or duties, for all that dress and appearance and the betraying wedding-ring would seem to point to both; mere idlers cumbering the ground which others till, and living as they best can on food which they only help to consume, taking no trouble to create or prepare. These multitudes of idlers to be collected together in the streets of any large town at a moment's notice, have always seemed to us to be the oddest phenomena of our social life. Men with the need and marks of work legibly written on every square inch of their person and attire, why are they not at their

bench, in the factory, the foundry, the shipyard, at the anvil, at the loom? Or if they belong to none of these trades, and are of that queer nondescript class which seems to have no settled occupation, and one may well believe no settled home—which calls itself generically the class of the 'handy men,' men ready for odd jobs of any kind and living on the disregarded crumbs of labour—how is it that they can give so much time from their poor scratchings on the surface of the great field of work, and spend in street sight-seeing that precious jewel of humanity called time? Who can tell? All we know is, that like vultures gathered to the carcase, not the least event can happen in the streets out of the ordinary run of daily traffic—a horse cannot fall, a foreigner in his native costume cannot pass, a new kind of hurdy-gurdy cannot grind out a familiar tune, a mountebank cannot go through tricks that were stale a hundred years ago, nor Punch repeat a pantomime known by heart to all but the rising generation—but the idlers are gathered in crowds; and for them at least all the duties of life are suspended for hours to come.

Perhaps nowhere do we see so many idlers in public as in Paris. In the gardens of the Tuileries and the Luxembourg, on the free benches of the Champs-Élysées, wherever there are lounging-places to be had for nothing, we find men whom we would naturally expect to be at work, not play. When the open-air concerts are given by the bands, as many of the lowest class as of the well-to-do—none of the highest—gather round to listen; and even pay their fifteen or ten centimes for chairs within the inclosure where they can hear better. It is strange to English eyes, even to those accustomed to the sudden congregation of idlers in the streets when anything abnormal happens of which we have just spoken. Judging superficially, it would seem as if all Paris made perpetual holiday; but as a set-off, the hours of labour are long, and men in business work early and late—earlier and later than we do. Also, not so many women are seen idling in the streets. The habits of French life do not encourage the independent loneliness with which we are becoming daily more familiar among our women. The *bonnes* (nurses) of course come in for all the sunny open-air attractions; but then they have a reason for it; they have the children to take out; and if good things fall in their way, while that way is one of duty, can we wonder that they pick up their portion of the roasted larks which fall from the sky? Perhaps though, we are more struck by the mass of idlers to be seen at all four corners in Paris, because of the climate and the customs which allow of so much more open-air life than with us. In our cities our idlers would have to be sought for under cover—in the gin-palace, the skittle-alley, the billiard-room. In Paris they stretch themselves on the free benches in the sun, and doze away the idle hours while the birds sing overhead, and the falling blossoms of the chestnut trees strike them lightly on their upturned faces. They may be distanced perhaps by the Neapolitan *lazzaroni* and the Roman beggars; which last, however, work at their calling, such as it is; though their labour is not very exhausting to themselves, and something less than profitable to the community at large.

But indeed we find these idlers wherever men

are congregated together. As shadow is to light, as good is to evil, so is indolence, idleness, uselessness, to that industry by which all the noblest things of life are accomplished and the world is lifted from the darkness of night—which is ignorance, to the light of the day—which is progress. Genius has done great things for the human family; but genius has not done so much as industry. Genius without industry is for the most part abortive—a lightning-flash shewing hidden beauties for a moment, while industry toils at their permanent disclosure; but had it not been for that industry, no lightning-flash shewing where those beauties were to be found, would ever have made them the possession of men. Wise, and to the purpose, was the advice given by an old hand to a young aspirant for literary honour. The old hand was asked what faculties he considered most necessary for a successful novelist? Instead of going over the expected range of invention, character, epigrammatic smartness, dialogue, or the like, as the youth expected, he said simply: 'A pound of cobbler's wax to keep you to your chair and your work.' He was right; and the then youth, now one of our veteran and most successful, if also one of our most prolific novelists, found the pound of cobbler's wax in a strong will, unvarying regularity of habit and method, and a persevering power of industry and work which has made him the master of fortune—and his craft. 'Laborare est orare.' The best faith is that which translates itself into practice; the highest duty that which has most regard for the welfare of others. If this is true, then the converse must be also true; and idleness must be as unworthy as industry is noble—idlers as undutiful as the workers are faithful.

F A L L E N F O R T U N E S.

CHAPTER XXIV.—TONY'S EXPEDITION.

At nine years old some town-boys are already men in matters upon which a large class of men most pride themselves: in self-reliance, habits of economy, and the art, if not of getting on in the world, at all events of taking good care of themselves in it. In seven years more, if such a lad is in the costermonger line, he will even have a wife and a carriage. But in the upper classes, our boys remain boys for a long time—some of them, under exceptionally favourable circumstances, even all their lives—and notwithstanding the boasted advantages of our public schools, are strangely helpless and dependent. They are trusted early enough (occasionally too early) to go to the play by themselves with a sovereign in their pocket; but without the sovereign—without, that is to say, the adventitious aids, and claims upon the services of others, to which they have always been accustomed—the British school-boy is no match for the street Arab of one half his years. When Master Anthony Dalton set out on his errand to Dr Curzon's, he had not even 'the light heart and the thin pair of breeches' so much eulogised by philosophers as adapted to the needs of human life. He had a very heavy heart and knickerbockers. There was nothing on the side of this

gallant young gentleman, aged nine, but pluck and a good cause; and there were a great many things—including the wind, which was from the north-west, and blew right up the valley—against him.

Like the rest of his race, he was of delicate constitution, and had been brought up delicately, as was natural enough in a family in which he was the only boy. Town-born and town-bred, he had never even seen the country save in summer-time, till he came to the Nook, and had probably never been out in it, save in a carriage, after dark. He was not the least of a 'molly-coddle,' and certainly no coward; yet if the road to Dr Curzon's had been throughout in its normal state, and well lit as a London street, circumstances had been such with Tony as to render his present expedition, in the phrase of his women-folk, 'quite an undertaking;' and considering that the night soon grew to be so dark that he could scarcely see a yard before him, and that the snow was everywhere two feet deep at least in the roadway, and sometimes half-a-dozen, it must be allowed that the child had his work before him. Of difficulty, however, and far less of danger, Tony had no thought as he ran down the noiseless road towards the bridge. His mind was full of his mother, the sight of whose death-like features had appalled him, and his one consuming idea was to bring Dr Curzon to her side and save her life. He no longer sobbed, but husbanded his breath for her dear sake, and plied his little legs. It had been his intention at first to go to Farmer Boynton's, as Margate had suggested, and get a messenger from among the men at the homestead; but the farm was some way up the valley, in the contrary direction to the doctor's house, and he felt that time would be lost by his so doing. If he could fetch the doctor himself—and the snow was not very deep as yet, though he made but slow progress—help would reach the Nook all the sooner. Behind were the lights of the village; on the left was the solitary beacon of Boynton's farm; to the right lay the long road, so white and yet so dark, with no glimmer from house or homestead; yet to the right he turned, and plunged on through the half-yielding snow.

It was a pitiful struggle, as struggles against Nature in her iron mood mostly are; and the odds, always great against poor humanity, were in this case overwhelming. The little lad did not even know, what any child who does 'the wheel' before the omnibuses in a crowded thoroughfare, for halfpence from the knife-board, could have told him, how to husband his breath. He was almost 'pumped out' already, yet he ran on at the top of his speed. It was grown too dark to distinguish the hard snow from that which was rotten and gave way to his light tread, or to avoid the deep furrows left by the carrier's cart. A slight bend of the road had already hidden the lights behind him, and walls of snow shut him in to right and left. His mind reverted to a picture in the old house at home of the retreat from Moscow, of a young conscript left behind by his comrades, and perishing in the white and solitary

waste. It had taken hold of his childish imagination, and he had often dreamt of it in his little cot, and been glad to wake in the morning and find his mother's face looking down upon him with her sweet smile. At that recollection his heart smote him for having forgotten the condition in which he had left her, even for a moment, and he sped on with renewed vigour. If will could have done it, Tony would have run on to York, had it been necessary; but unhappily it is not true that wherever there is a will there is a way. The boy began to stumble, and then to stagger, like a drunken man. His legs still moved, but mechanically; he had lost control over them, and was presently landed, head first, in a snowdrift by the wayside; there he lay for a few seconds, half unconscious. He would have been glad enough to remain there for ever, but the thought of his mother still spurred him on, and he contrived to extricate himself. There was a sharp pain in his right foot, as though a hot iron had seared it; his shoe had come off in the snow. As he ran on, he sent forth one wild passionate cry—a bitter acknowledgment of failure, rather than an appeal for aid; then stumbled and fell.

'Hulloa! there; hulloa!' responded a gruff voice. Tony heard it, but as one hears a voice in dreams.

'I say, hulloa!' continued the voice reproachfully, as though a civil observation of that description, civilly put, had deserved a civil reply. Then the light of a lantern gleamed over the track, and John Bates, the Bleabarrow carrier, came cautiously along it, and almost fell over the boy's prostrate body. Then he exclaimed 'Hulloa!' again, but this time in a very astonished tone—it was a word he had evidently found capable of great modulation—and stooping down, picked up poor Tony.

'Why, hulloa! young gentleman'—here the word expressed commiseration as well as surprise. 'This is a pretty game, especially played with "one shoe off and one shoe on," like "my man John" our Emmy sings about. It's my opinion as it's precious lucky for thee that the old mare came to a full stop just where she did, or thou wouldst never have seen the Nook again.' He carried the boy back to his cart, which was stuck fast in the snow, a few yards ahead, and placed him tenderly among some empty sacks.

'Well, this settles me not to try to push on any more.—Coom, Ned, coom' (here he addressed his horse); 'let us turn round and go back to Sanbeck.'

'The doctor, the doctor!' cried Tony suddenly, raising himself from the sacks. 'Mamma's ill, and wants the doctor.'

'And could they find nobody in all the place but a little lad like thee to fetch the doctor to thy mother such a night as this?'

'Yes; a man could have gone from Farmer Boynton's, but I thought I could go quicker myself. Oh, please, let us go at once.'

'But the wheels can't move a yard that way; and I doubt whether I could get there afoot myself. To be sure, I could take Ned out, and ride him, and leave thee here in the cart.'

'I said I would fetch the doctor,' said Tony resolutely, 'and I'd rather do it.'

'Very good; and so thou shalt. With thy bare foot, and in such sad plight, it will be better for thee to be put to bed at Dr Curzon's. So, I will

ride Ned, and take thee before me. If it had not been for the good stuff they gave me at the Nook, I should been starved o' cold by this time; and one good turn deserves another.'

The honest carrier needed not have thus found an excuse for an act of benevolence which was natural to him. Most men who pass their lives exposed to wind and weather have wholesome natures. The possession of an 'Emmy' of his own too, doubtless made 'the soft spot' in Mr John Bates's heart still softer. He unharnessed the horse; and throwing a sack or two on his bare back, for Tony's accommodation, mounted, and placing the boy before him, moved slowly along the snow-choked way towards the doctor's house. They reached it at last, taking six times the time they would have done upon ordinary occasions; and scarcely less astonished was the worthy doctor at their appearance than if they had been two veritable Knights Templar travelling according to the ancient custom of their order. He looked grave, indeed, when Tony told him his errand; but reassuming his habitual cheerfulness, at once ordered his pony to be brought round.

'As for you, young gentleman, since you have lost a shoe,' said he, 'you had better sleep at my house.'

But Tony besought so earnestly to be taken back to the Nook, to see about mamma, that having been fortified as to his inward boy with something hot, and wrapped up in various warm coverings, he was once more placed before the carrier, who had made up his mind to stay the night at Farmer Boynton's; and the three started together for Sanbeck. It was an expedition that in after-years Tony never forgot, down to its minutest details; the great events of human life stamp not only themselves upon the mind, but all the surroundings which accompany them: the snow-clad road, the leaden night, and every incident of his noiseless journey, were destined to hang in that picture-gallery of the Past (which there are none so poor as not to possess) for ever; the very motion of the sturdy shoulders of the horse the boy so unwontedly bestrode, recurred to him long after his two companions had paid the debt of nature.

Though they rode through the muffled courtyard of the Nook without a sound, the servant-girl, who was on the watch, ran out to meet them, and whispered something in the doctor's ear; he was off his pony in an instant, but not before Tony had scrambled down from his huge steed.

'No, my boy,' said the doctor gravely, as the lad was about to limp up-stairs; 'you must not go to your mamma's room just now.'

'What is the matter, Sue? Is mamma worse?' cried Tony wildly; his little legs trembled under him with fatigue and apprehension of he knew not what. The girl picked him up in her strong arms, and placed him in a chair by the kitchen fire.

'No, no; now the doctor has come all will be right,' said she; 'but you must not run about without your shoes. What a walk you must have had through the snow and dark!'

'Oh, that's nothing: at least, nothing to cry about,' for the girl had begun to sob hysterically. 'Tell me about mamma.'

A thin shrill quavering cry was heard above-stairs.

'What is that, Sue?'

'You have got a little baby brother, Master Tony; such a dear little thing!'

Tony was nonplussed. He had always understood that the doctors brought these little strangers; but if Dr Curzon had brought this one, he must have carried it in the crown of his hat a performance Tony had never seen equalled save by a conjurer in London, who had brought a bowl of gold-fish out of the same receptacle.

'I should like to see my baby brother, if I can't see mamma,' said Tony dreamily: he had but a faint interest in this newly arrived relative, and he felt dreadfully tired.

'So you shall, if you will just lie down in your bed a bit: it is your bedtime nearly, and you must take off your wet things, you know.'

'But you'll call me directly mamma asks to see me?' pleaded the boy.

'O yes, Master Tony, yes; when she asks, I will.' There was something strange in the girl's voice and manner, which he could not understand. But he was too worn out for guessing riddles. He even submitted to be carried into his own little room, an indignity he had not endured for many a year, and was put to bed like a child, or a gentleman who has taken too much champagne.

In the morning he awoke so late that the sun was streaming full upon his bed, and upon Jenny's thin white face, who was bending over his pillow with an expression that he had never seen her wear before: it was tender, but yet grave and almost stern.

'Have I over-slept myself, Jenny, and got late for lessons?' said he. Then rapidly collecting his ideas: 'And how is mamma? Sue promised that when she asked for me— O Jenny, what is the matter?'

'Mamma will never ask for you again, dear Tony, nor for any of us. She is'—

'Dead?' The boy burst into passionate sobs.

'Oh, don't say dead, Jenny!'

'Yes, darling. We have lost the best mother that ever children had.'

'O mamma, mamma!' cried Tony, stretching out his little arms. It was terrible to see so young a creature so torn with anguish.

The door opened, and Kitty entered, her beautiful face puckered with weeping. 'You have told him then, Jenny?' said she in broken tones.

'Yes, dear: I thought it best.'

'But why, *why* did they not send for me? Why did they let me sleep?' asked Tony reproachfully.

'Did mamma never ask?'

'Yes, darling, yes,' said Kitty; 'she did ask for you, but not in time; and when we told her you had gone for the doctor through the dark and snow, she thanked you with her sweet eyes. "My poor, poor boy," she said. It is we who are to be pitied, darling, and not she, for she is an angel in heaven.'

'Sue told me I had a baby brother?' said Tony softly, after a little pause.

'Yes, dear, you have.'

'How strange and sad it will be for poor papa,' continued the boy thoughtfully, 'to hear that mamma has gone to heaven, and that there is a baby brother!'

Neither Kitty nor Jenny could make reply. They had not the heart to tell him that in all

human probability the news that had broken their mother's heart was true; that they three—and the baby boy—were left alone in the world; not only motherless, but fatherless.

NEW GUINEA AND ITS INHABITANTS.

IN January 1871, H.M.S. *Basilisk* left Sydney under orders to proceed to Cape York, on the north-east coast of Australia, her mission upon the occasion being to land horses and stores at that settlement. The time given for the voyage was three months. Her commander, Captain John Moresby, was but little aware when, somewhat loath, he left civilisation and the kindness of Sydney friends behind, to sail for the extreme north point of Queensland, that the voyage would lead to results which should rank him among famous discoverers. Nevertheless, such was the case, and the results are before the public in a volume entitled, *New Guinea and Polynesian Discoveries, &c. A Cruise to Polynesia, and Visits to the Pearl-shelling Stations in Torres Strait, of H.M.S. Basilisk*.

Captain Moresby having landed the horses and stores at Cape York, had some time on hand, and like a faithful servant of the government, he determined to employ it in visiting the pearl-shelling establishments in the Torres Strait which he had reason to believe required looking after in the interest of the South Sea Islanders who were employed as divers. The limits of the Australian station at that time extended to only a few miles north of Cape York, although they have since been altered to embrace the whole of New Guinea. He determined, however, in the discharge of a duty to the poor pearl-divers, who were often cruelly imposed upon, to incur the responsibility of taking the *Basilisk* inside the limits of the China station, where, if ill-luck had attended his good ship—and two years before, H.M.S. *Blanche*, in a somewhat similar attempt, had been almost totally lost on a coral reef—the captain, if he had survived, would have had some difficulty in explaining his conduct to a court-martial.

The gallant captain ran the risk, however, and happily came safely out of the dangers. Having visited the pearl-shelling and bêche-de-mer fisheries, he saw little or nothing to complain of; and gives a short account of each of these two kinds of fishery. For the pearl-shells, the mother-of-pearl of commerce, the divers go down in four and six fathom water, in localities abounding with sharks; but are very rarely attacked, probably because so many of them dive together as to alarm the sharks. He saw one poor fellow who had been fearfully torn by a shark while diving, and was rendered a cripple for life, the sinews of his thigh having been divided. 'I only know,' he adds, 'of one other accident having happened, by which a woman was similarly injured. The women, as a rule, are considered more dependable divers than the men. The pearl-shell oyster of Torres Strait is a magnificent oyster, weighing from three to six pounds; in some instances, reaching a weight of even ten pounds. The divers frequently bring up one under each arm. The oysters are opened at once, when taken into the boat, and the fish used as food; the pearls, if any, falling to the share of the crew; but the pearls are few, small, and of poor quality.' The schooners engaged in this trade sail from the Strait to Sydney at the close of the year,

when the setting in of the north-west monsoon makes the passage easy; they generally take with them each a cargo of thirty or forty tons of pearl-shell, which is valued at Sydney at one hundred and fifty to one hundred and eighty pounds a ton.

The head-quarters of the *bêche-de-mer* fisheries are at the mountainous Isle of Darnley, lying at the eastern entrance of the Torres Strait, beyond the region of pearl-shell. The *bêche-de-mer* is a large sea-slug left lying in great quantities on the coral reefs by the receding tide, and easily gathered by the fishers. The slugs are cut open, cleaned, and placed on thin iron plates in a smoke-drying room, where, after being thoroughly dried, they are picked and sorted for the Chinese market. The *bêche-de-mer* is divided into three qualities. The best, called the Red Fish, is worth one hundred and forty pounds per ton; the second, or Black Fish, one hundred and twenty pounds; and the worst, or Teat Fish, about eighty pounds; and as all the qualities are plentiful on the reefs, the trade is a lucrative one.

The inhabitants of the Torres Strait islands are black Papuans—like those of the opposite coast of New Guinea—a fierce and warlike race, who, by kindly and politic treatment from the pearl-shellers, have been taught to take advantage of the new industry which has been for nine or ten years established among them. While Captain Moresby was visiting the Warrior Island, the natives regaled him and his companions with a 'corroborie,' which must have been a stirring exhibition. 'It was a striking one,' says the gallant chronicler; 'for a huge wood-fire threw a broad light on the tall naked figures of the savages, and painted them sharp against the darkness. The old men and women crouched in a ring, and inclosed the dancers, droning out a slow chant, to which they clapped in time, and beat rude drums, always quickening as the dancers quickened. These gave us a battle-dance, and chased their enemies with guttural cries, tossing their braceleted arms, and heads decked with long cassowary plumes, as they rushed; their eyes flashing, and the whole body alive with fierce excitement, till they looked more like evil spirits than men. The dance was a perfect study from reality. They made signs of all their actions of war, drew the bow, and threw missiles; and bounded on their enemies at last, and slew them, with a semblance that was frightfully like reality. Better things were the picture-dances representing scenes in daily life, such as spearing the dugong, fishing, love-making; and the last and most graceful of all was one which illustrated the coming of the north-west monsoon, and the consequent planting of yams, taro, and sweet-potatoes—a poem in a dance. Nothing more perfectly graceful could be seen than their movements, as, rapidly gliding round the fire with swaying bodies and inflected limbs, they shewed how the wind blew, how the ground was turned up and the seed sown, and ended with a joyous dance.' This account of a *corroborie* is recommended to the attention of students of the natural history of dancing. It is a patriotic dance, and would seem to serve with these people a purpose analogous to those achieved by patriotic songs among other races.

Captain Moresby did not visit the shores of New Guinea on this occasion. The time he was ordered to spend on the cruise drawing to a close, he returned south, and arriving at Cardwell on the

9th of March, he was informed there of the wreck of a brig on the Great Barrier Reef. This unfortunate ship was on a prospecting expedition to New Guinea, and had, besides her crew, 'seventy-five spirited young men' from Sydney on board. 'They had clubbed together at the rate of ten pounds apiece, and bought the *Maria*, a crazy old brig of one hundred and sixty-seven tons, as ill-found aloft as she was leaky below; and, had fortune favoured, might have reached New Guinea, for all went well for a fortnight, and they had come within four hundred miles of the desired coast.' Our captain exerted himself to the utmost to assist the unhappy waifs of this wreck, whose laudable efforts, though unsuccessful, he still regarded with favour. He writes: 'Thus ended this unfortunate attempt to reach New Guinea, an attempt which is but one proof out of many that Australian instinct points to the possession of this great island. Many attempts to establish a footing in New Guinea may fail, but the instinct is a true one, founded on natural facts and needs, which time will prove to be imperative.' He unmistakably believes the Australian colonies are on the eve of a new era of development; and although Lord Carnarvon refused, some months ago, to give government-sanction to an expedition of more formal pretensions and formidable dimensions than that which sailed on board the leaky and unlucky *Maria*, there would seem to be a widespread feeling in favour of annexing New Guinea.

The *Maria* expedition was not entirely a failure. The upshot of it called particular attention to the object the 'seventy-five spirited young men' had in view in setting out on their reckless voyage. As Captain Moresby writes of his own subsequent expedition: 'Notes of alarm were sounded to the effect that Russian, French, and Italian travellers were now exploring this island, the possession of which must in the future be a necessity to Australia, because of its near vicinity, and its strategic and relative geographical position, and it was feared that these efforts might lead to a foreign occupation in time. Amongst other rumours, it was reported that Americans were about to send an expedition from San Francisco to examine the eastern shores of the island. I deeply felt the importance of forestalling any attempts of alien nations to establish a claim to this great island, knowing that foreign possession might lead to complications, and feeling that the development of the great Australian empire would be cramped in the future, should its progress be arrested in the north. I desired also to secure to England the honour due to a country which had sent Cook, and Dampier, and Owen Stanley to these seas, by filling in the last great blank remaining in their work, and laying down the unknown outlines of East New Guinea on the map of the world.'

Leaving Sydney on Sunday, December 8, 1871, for a second Torres Strait cruise, with permission to visit the coast of New Guinea, Captain Moresby, after discharging many important duties, and encountering a great deal of danger and adventure, came in sight of the magnificent Owen Stanley range of mountains, in East New Guinea, on February 13, 1872. Captain Owen Stanley partly surveyed this part of the coast in 1849, but did not attempt to land, as the natives were considered dangerous. Our adventurous captain, however, landed, and, thanks to him, we now know

something of these dangerous natives. Anchoring in Redscar Bay, which has been marked on the maps since Stanley surveyed this coast, Moresby pulled for Redscar village. Crowds of natives anxiously watched and waited for the approaching boat. The captain and his attendants beached their boats amongst a crowd of canoes, hauled up on the black sandy beach, and stepped on shore among the natives, who, wholly unarmed, and without a sign of distrust, gave them a hearty welcome. And now we are introduced for the first time to a gathering of native East New Guineans. 'We were surprised,' says the brave and gentle recorder of this interesting encounter, 'to see that these people differed totally from the tall, muscular, fierce-looking, naked, black Papuans we had left in Torres Strait. These men were more of the Malay type—small, lithe, copper-coloured people, with clean, well-cut features, and a pleasing expression of countenance. They wore their own hair, frizzled out mop-fashion, and were slightly tattooed with stars and small figures on the breast and shoulders, as I have never seen the black Papuans. They had nothing in the way of clothes but a sort of leaf-girdle. The young men were ornamented with white cowry shells bound round their foreheads, arms, and legs, and bird of paradise and cassowary plumes on their heads and shoulders; the older appeared to dispense with these adornments. The septum of the nose and lobes of the ear were pierced, and tortoise-shell rings, pieces of bamboo or shell, put through. The women were ill-made and slovenly looking as compared with the men; their dress was the "ti-ti," or grass petticoat; but the otherwise nude body was adorned by the most extensive tattooing, so well executed as to excite the admiration of all amongst us who had not seen the exquisite tattooing of the Japanese. . . . The little children were all dressed like their elders of either sex, and did not fear us in the least as we walked about, but played round us, shooting with small bows and arrows.'

Captain Moresby afterwards made the first survey on record of the south coast of New Guinea, inside its Barrier Reef. The natives proved all along the coast to be kindly and friendly. A passage was found for the *Basilisk* through the Barrier Reef—henceforth to be known as Basilisk Passage. A new port and harbour were happily discovered inside the reef, in which mariners will find a different kind of shelter from that which has heretofore had to be put up with in the exposed Redscar Bay.

One other glance at the natives during this survey. 'Mr Watts, one of the engineers, lost his way, and when beginning to grow anxious, fell in with a party of natives. Far from attempting to take any advantage of his helplessness, they fed him, and took him to their village, making signs that they wished him to sleep there. Finding that he wished to return to his companions, they offered to guide him, stipulating, however, that he should shew himself off in the village first, and permit all the inhabitants to admire his white skin. This he did with a great deal of pleasure, placing himself on a verandah, to be handled and gazed at by scores of beholders.' These Papuans seem to be as fond of a show as are the natives of the British Isles.

Proceeding to South-east New Guinea, our

explorers found that Captain Owen Stanley had laid down the great range of mountains which bears his name thirty miles farther to the eastward than it actually extends; and that the point of land which he had marked as the south-eastern extremity of Papua was one of a series of valuable islands, of which Captain Moresby took formal possession in the name of Her Britannic Majesty. Of the north-east shores of New Guinea from East Cape, as he has named the easternmost point of the mainland, no record exists of their ever having been previously seen by a white man, and now they are clearly mapped out by Captain Moresby to a distance of one hundred and ninety miles as the crow flies. The D'Entrecasteaux Islands—named after their discoverer, who visited this region in 1793, and lying off the north-east extreme of New Guinea—were so utterly unknown, that Captain Moresby and his companions were supplied with sailing directions to the effect that they would probably be found to be not islands, but an integral part of New Guinea. The whole region is now mapped and named; and as Captain Moresby predicts that it will ultimately be inhabited by Englishmen, it may be remarked that they will feel themselves pretty much at home among such names as Rawlinson Range, Markham River, Moresby Island, Milne Bay, Goschen Strait, Goodenough Bay, Ward-Hunt Strait, Mounts Glalstone and Disraeli, and other home-names in abundance.

The natives down east here are similar in appearance to those already described; but as the *Basilisk* bore west on the north side of the island on its way to Singapore, the captain was struck with a great change of character. In Humboldt Bay, when they anchored, they were presently surrounded with scores of canoes full of wild vociferating savages, armed with formidable bows and arrows, here first seen by us in East New Guinea. They shewed no sign of fear or reverence; and knowing their reputation for making sudden attacks, we kept our rifles ready. It seems singular that the nearer we come to the seat of the Malay race proper in New Guinea, the more unlike the coast native becomes to the Malay type, the Humboldt Bay people being almost black, with hair inclining to be woolly, the nose and lips verging towards the negro formation. The women were but little ornamented, and wore the ti-ti, or grass petticoat; the men, who were unclad, were profusely decorated with barbaric finery, some of which, particularly a breast-plate of boars' tusks laid flat, and sewn on to plaited cane-work, on which a ground-work of brilliant red seeds was gummed, had quite a fine effect. Once or twice there was every prospect of a free fight amongst the men in the canoes; bows were bent, spears brandished, amidst furious shouting in some dispute over their trading. On one occasion a man parted with some sago for a smaller quantity of hoop-iron than his better-half thought due; and without more ado she seized her paddle and belaboured him heartily over the head and shoulders; his friends, instead of pitying his plight, shouted with merriment; he did not retaliate, but slunk away, looking foolish. We have heard of incidents of the latter type occurring not so far from home.

We mention last the achievement of which Captain Moresby seems more proud than of all

the others. It is the opening up of a new and accurately surveyed highway for commerce between Australia, New Guinea, and China. It is past the east end of the island which was formerly considered the extreme point of New Guinea, and now called Moresby Island, and is of a depth varying from thirty to five hundred fathoms. It was on account of this discovery that Captain Moresby annexed this and the neighbouring islands. 'The importance of our discoveries,' he says, 'led me to consider their bearing on imperial and Australian interests. There lay the vast island of New Guinea, dominating the shores of Northern Australia, separated at one point by only twenty miles of coral reef from British possessions, commanding the Torres Strait route, the transit of the Queensland mails, and our newly discovered route for Australian trade to China; commanding the rich and increasing pearl-shell fisheries, with the working of which we had obtained a complete and interesting acquaintance, and also the *bêche-de-mer* fishery, which furnishes an important article of export to China.' Accordingly, on April 24, 1873, making the best dispositions possible in the circumstances to give some little éclat to the ceremony of taking possession, he annexed these islands; and advocates the annexation of New Guinea, for the reason that 'the occupation of this island by any foreign maritime power, more especially since the discovery of the *Basilisk's* harbours and anchorages, would be a standing menace to Queensland.'

DASHMARTON'S LEGACY.

CHAPTER III.

LUCY's first and abiding impression of the stranger, who had been introduced to her as Mr Streeter, was an unfavourable one. 'He is a much commoner "cad" than Alfred Harvey,' she said to herself, although there was nothing absolutely offensive in his demeanour. He tried to make himself agreeable; but there was something hard and unpleasant beneath the superficial crust of his politeness.

After they had had coffee, Spiller proposed to his companion that they should smoke. 'Lucy don't object,' he said; 'she is used to it.'

'But not in such a tiny room as this,' she said; 'I should find it too much. But there is a little fire left in the schoolroom, and as I have some letters to write, I will leave you to your own devices.'

Thus saying, she rose, and left the room. Mr Streeter opened the door for her, and bowed her politely out; but she caught a sinister gleam in his eye for a moment, which startled and perplexed her.

The letter-writing was not a mere pretext. Alfred Harvey was coming in the morning avowedly for an answer to his suit, and an answer he should have. But she would not trust herself to see him. She would write him a long kind letter, that should console and comfort him, at the same time that it made it evident that she could not marry him. No; had he been ever so dear to her, she would now have refused him. She would

bear her burden alone; she would carry into no other family the taint and suspicion that must rest upon her. She felt herself cut off from the rest of the world by the secret that she carried, by the possession of this money; and although she had once thought of handing it over to the Chilpruns people yet now she would die rather than do any such thing. Her heart swelled with proud indignation at the thought that these people had set a watch upon them; upon her, who had renounced everything, and left even what she might have claimed as her own in their hands, and who was innocent and honest as the day, up till now.

But now she would fight the matter out with them, and hold to what she had got. They would disgrace her, no doubt, now, if they found her out; perhaps they would send her to prison. The odds were all on their side: they had everything, wealth, influence, the whole power of the law; and she had only a woman's wit. Well, she would fight the battle, nevertheless; and the contest, she felt, commenced from this moment. There was no security now anywhere; her little maid might be watching her, paid to report her movements; the spy might be in her own house, might be watching her now.

At that moment flashed into her mind the sinister look that the polite young friend of Spiller's had cast upon her. Who was he, this youth, and were all his antecedents known to Spiller? She must find this out on the instant. She went and opened the door of the sitting-room softly, and called to her brother.

'Spiller, I want to talk to you about the letter I am writing. You will excuse him for a moment, Mr Streeter.'

Her brother came out with a pipe in his mouth. 'Well, Lucy, what is it?' he said, lolling against the jamb of the glass-door of the schoolroom.

'Shut the door, and come here.—Spiller, what do you know about your friend? Tell me all, at once; it is important. Is he a Cambridge man? Did you know him there?'

'No; he's not exactly a Cambridge man. He knows a lot of fellows I know; but I never saw him, to say the truth, before he came down here.'

'And you take him into your confidence and friendship.'

'Well, when a fellow holds an overdue bill of yours for fifty odd pounds, you are obliged to make a friend of him. He told me that he had put his name to it, and had been obliged to take it up.'

'Spiller, he is a spy.' At this moment, Lucy raised her head and saw, looking through the glass of the door, the now sinister and forbidding face of Mr Streeter. He opened the door and walked in. Lucy thought that all was lost. She made a movement to grasp the note she was writing, in order to conceal it; but she desisted next moment, seeing that she would only excite suspicion.

'I got tired of my own company pretty soon,' said Mr Streeter, with a harsh kind of laugh; 'and so I thought I'd come in and join you.'

Although Spiller had a feeling of respect for the friend to whom he was indebted, and who had, as far as that went, treated him with a good deal of consideration, yet he thought he was a little too free and easy.

'You don't seem to know, Streeter,' he said, 'that my sister and I are having a little private conversation. Be good enough to retire.'

The young man's face assumed a peculiar expression; and as he cast a keen glance here and there, he seemed little inclined to obey the speaker's command. Spiller in turn frowned, and seemed to meditate hostilities. But Lucy swiftly interposed, laying her hand upon her brother's arm.

'You can stay now, Mr Streeter,' she said, turning upon him with one of her sweetest smiles; 'we have finished our talk, and I may tell you that it was about none other than yourself.'

'About me!' said Streeter, his brow clearing, and a complacent smirk taking its place. 'And pray, what have you to say about me?'

'Take a seat by the fire—one of those cane-bottomed ones; the other is not warranted to bear—if you prefer this room to the other.'

Streeter seated himself, and looked complacently at Lucy, who held his glance for a moment, and then cast down her eyes in apparent confusion.

'I know Spiller's affairs, you see,' went on Lucy, playing nervously with the note-paper on the table, 'and how he is indebted to you. Well, I am going to ask you, for my sake, to let him have a little longer time.'

'If I had any security that the money would be paid in the end.'

'I can give you no security but my own promise,' said Lucy. 'You see, the circumstances are peculiar. We shall have money by-and-by, but at present there is a lock-up of capital. In a little while it will be released.'

'Yes; that is all very well,' said Streeter; 'and if I were satisfied that the money would be really forthcoming—— But you see I have been put off with promises so long. Now, if you could give me some knowledge of where the funds are which will soon be forthcoming.'

Lucy sat still and thought for a moment. 'You are a friend of Spiller's, and can be trusted. The money we are entitled to is at present deposited in a London bank.'

'What bank?' asked Streeter.

'The London and Westminster,' said Lucy at a hazard.

'And in whose names?'

'The joint names of myself and Spiller.'

Spiller made a movement of surprise, that Lucy repressed by a quiet look.

Streeter sat for a moment in thought. 'Well,' he said, 'I will take your word for it. Only, I tell you fairly, I want money badly. Have you not enough in the house to satisfy me? Come, now.'

'Spiller and I were taking stock this morning,' said Lucy with a laugh, 'and our united means were thirty shillings.'

'Yes, that was so,' said Spiller, thankful to feel on firm ground at last, for he had been in the region of clouds and mists during the whole of the former part of the conversation.

Streeter said if that were the case, he would wait for another week or so; and after that, business affairs being settled, the conversation took a more

lively turn. Streeter did his best to make himself agreeable to Lucy, and flattered himself that he had succeeded. And in parting, he announced that as his business here was finished, he was going up to town next morning.

'Such a pity,' said Lucy sarcastically; 'just as we were beginning to be acquainted.'

The leave-taking was a very cordial one, in outward appearance.

'Upon my word,' said Streeter to himself, as he walked back to the *White Hart*, 'if the balance at the bank turns out respectable enough, it might be worth one's while to cut the service and go in for matrimony.'

'What a comfort he is gone,' ejaculated Spiller, flinging himself into the schoolmistress's arm-chair, and giving expression to his relief by a series of yawns and kicks. 'But I say, Lucy, what about the balance at the bank? Has it any existence?'

'None at all,' replied Lucy, giving way, now that the strain on her nerves was over for the moment, to a violent fit of sobbing. 'I have lied most abominably.'

'And all for my sake,' returned Spiller sympathetically. 'But after all, it won't put off the evil day for long. He will find out that there is no balance, and will be down upon me like thunder.'

'Spiller,' said Lucy, springing up, dashing aside her tears, and going to her writing-table, 'will you go to the other side of the glass door and shut it? There now, you are a spy!' she cried in the same tone of voice in which she had spoken to Spiller before Streeter came in. 'Now, do you hear that?'

'What is all this pantomime about?' said Spiller, opening the door.

'Did you hear what I said when the door was shut?'

'Not a word.'

'Thank you; I only wanted to test the acuteness of your hearing.—No; he can have no suspicion,' said Lucy to herself.—'Spiller,' she went on aloud, 'do you know who your friend is? Are you aware that he is a spy, a detective?'

'Nonsense!' cried Spiller. 'If I thought so, I'd go and give him a good licking.'

'Don't do anything of the kind. Leave such kind of people alone.'

'But what should he come to spy for? The nakedness of the land?'

'Listen!' said Lucy; and recounted to her brother what she had heard in the churchyard.

'Yes, I see it all now,' said he, convinced in spite of himself. 'They think we've got a purse, Lucy. Don't you wish we had?'

'Hush!' said Lucy; 'don't think of such things.—Shall I tell him,' she asked herself at that moment, 'and get him to divide my burden? No; he has not the resolution to keep it to himself. Besides, I will not have him guilty too. I will be the only villain.'

Lucy slept little that night, and bedewed her pillow often enough with tears. What a alough of baseness and deceit she must wade through to keep this secret safe! And Alfred was coming on the morrow to ask her to be his wife. She was not fit to be the wife of any honest man. And yet the constant refrain of all her thoughts was, how shall I hide my money safe and sure?

The morning light brought no solution of the

difficulty to Lucy's aching head. There was the note still in her possession, and the respite she had was short. Perhaps before the day was over, Streeter would return, enraged at the deception practised upon him, and armed with authority to search the premises. She felt altogether dazed and stupid—fascinated, as it were, by the danger imminent, and unable to move hand or foot to save herself.

School-time came, and the children began to arrive. Still Lucy had not made up her mind. She must go on with her work, of course, and began mechanically to hear the children's lessons; but her mind was far away, and her pupils soon found this out, and began to take advantage of it. Then, to add to her perplexity, a visitor came in—the Rev. Tresilian Whitwick. Tresilian had heard of Alfred Harvey's return, and of his visit to Miss Dashmarton; and somehow, at the news, his interest in Lucy had suddenly revived. He was rather angry with her, indeed, for that she had received Mr Harvey. A schoolmistress, he said to himself, ought to comport herself as a nun—a sanctified sister, and only receive visits from the clergy. His position as a referee gave him a kind of right to interfere in the matter. Thus he would make an early visit to Miss Dashmarton, and give her a little salutary advice.

But when he arrived at her door, his courage had oozed away. He felt himself unequal for the task of reproof; it must be administered at a more convenient season. Lucy received him coldly, and with some little surprise, as if questioning what could bring him.

'I thought perhaps you would like—in fact I should like myself,' stammered Tresilian, 'to, ah—to catechise some of your older pupils.'

'O yes, by all means,' said Lucy. 'Come into the schoolroom.'

Tresilian was a shy man, and the open-eyed stares of all the school-girls abashed him a little; appalling, too, was the sudden silence that on his entrance succeeded to the busy hum of voices.

'Perhaps you would like to give the children a little address,' suggested Lucy—'something on the responsibilities of early life!'

But Tresilian did not think he could quite manage that. 'Go on with the usual routine,' he said, 'and if anything occurs to me'—

'Oh, then, perhaps you will take the geography class,' said Lucy, 'and see what they can do;' and before Tresilian knew what he was doing, he found himself with a book in his hand and a formidable array of young ladies before him.

Lucy took advantage of the moment to slip away. She thought that Tresilian would get on better when left to his own resources; and she wanted to have a few minutes' quiet thought on the one recurring subject. As she shut herself into the sitting-room, her eyes fell upon a book lying on the table—a new book on the various educational theories current, which some well-meaning friend had recently given her, and which she had covered with the usual school cover of glazed cloth, to preserve the binding. At the sight, an idea struck her. She hastily undid one half of the cover, took out the fatal bank-note, folded it lengthways into a thin strip, and taking a small slip of the same glazed cloth, sewed with hasty fingers a little pocket in the back of the cover, placed the note within it, closed the opening with more stitches,

and then readjusted the cover. She would give this book to Tresilian, and ask him to read it, and let her have his opinion upon it. Now, Tresilian was a slow, unwilling, but conscientious reader, and would take a month at least to master the contents and form an opinion thereon. In a month or less the danger would be over, and the Chilprane people would have done their worst. She had just finished her task when she heard a knock at the door. Her heart was in her mouth; perhaps she was too late. Emily had run to the door. It was a man's footstep—that of Alfred Harvey.

And yet Alfred Harvey was sufficiently embarrassing. Notwithstanding her perplexities and troubles, she could not help realising the absurdity of the situation. Tresilian keeping school for her, whilst she entertained his rival in the parlour! But Harvey was anxious enough. His face was troubled, and he spoke with strong emotion.

'I've come for an answer, Miss Dashmarton,' he said, 'as I said I would yesterday.'

'I can't give you one,' replied Lucy in desperation—'not now; you must give me more time.'

'Now, come, Lucy,' pleaded her lover; 'you have had plenty of time. It isn't from yesterday to today, but for months and months that you must have known what I was going to ask you—and you must have thought about it; and— Well, I must have an answer, Lucy.'

'Why can't things go on as they have done?' said Lucy. 'I should like you very much as a friend—as a brother.'

'There's no use thinking about that,' said Harvey; 'I've got no time for that sort of philosophising. Do you think a man can go on worrying and plaguing himself month after month, and year after year, and never come to a settlement? That may do for your Tresilians, with their superfluous high-flown notions; but it won't do for Alfred Harvey, farmer. If you'll have me, Lucy, I'll give my life to make you happy. If you won't, I must tear you out of my mind—burn you out, cut you out; anyhow, get rid of you, and start afresh. So, give me an answer, Lucy, plump and plain.'

'Then, if you must have an answer,' cried Lucy: 'No—no—no! You are too arbitrary and exacting altogether; and again I say no. And please let me go, without more ado.'

Lucy made her escape, and took refuge in the schoolroom. She was desperately afraid that Alfred would follow her; and that the rivals should meet in this way would be dreadful. But he did not come; the front-door slammed heavily to, and Lucy breathed freely. Tresilian had got on very well during her absence. He had begun by putting the questions in the book. That London was situated on the Thames, everybody knew; but when it came to Oxford there was a division of opinion. Some said the Thames, and some the Isis; while some of the girls thought it was the same river, and the rest would have it that it was a different one. Tresilian was happily able to set this question at rest of his own knowledge. He had rowed down from Oxford to London, and could testify that the rivers were the same. Then Tresilian, who was at bottom a good-natured young fellow, and fond of children, was led to describe some of the incidents of his voyage; and he succeeded in retaining the interest and attention of the little damsels to an extent quite flattering to his powers of description.

'I think I should like to come again before long, and talk to your pupils, Miss Dashmorton,' said Tresilian, rising to depart. 'May I?'

'I think my girls will be very glad to see you. —What do you say, girls?'

There was a general chorus of assent. 'You seem to have won their hearts very quickly,' said Lucy, as she accompanied him to the door.

'Ah,' replied Tresilian, 'if I could only succeed as well!'

'Oh, Mr Whitwick,' said Lucy, hastily interrupting him, 'as you are so interested in schools, will you look at a book I have got, read it carefully, and give me your opinion upon it?'

Running into the sitting-room to get the book which she had left on the table, she found it was gone. She ran back to the schoolroom. It was not there. The book had disappeared.

'Give me the name of the book,' said Tresilian, 'and I will order it.'

'Oh, it does not matter now. What can have become of it? O dear, what shall I do!'

'Don't distress yourself, Miss Dashmorton. The book will come to hand, no doubt. I will come to fetch it—to-morrow perhaps, if I may!'

But Lucy was too much agitated to answer, and waved an impatient adieu to Tresilian.

That her every action had been watched, and that her enemies had taken advantage of her momentary carelessness to possess themselves of the evidence of her guilt, was the first abstract impression on the girl's mind. It was, however, with a great cry of thankfulness and relief that she suddenly came upon a volume, which, although not her own, was of the same size, or nearly so, and bore on its fly-leaf the name of Alfred Harvey! The conclusion was irresistible, that he had for some reason or other taken up the missing volume and put it in his pocket. Would he find out his mistake, and return it? That was altogether a matter of chance. If he had finished reading the book he had left behind him, the other book might lie neglected for weeks. And in that case accident would have solved her difficulties in a very effective manner.

Whilst she was pondering over this, Spiller came in to dinner in a very provoking mood. He had met Tresilian, it seemed, and Harvey soon after; both of whom had told him they had just seen his sister.

'How the dickens did you manage them both, Lucy?' inquired her brother sarcastically. 'Why, it's like Box and Cox.'

'Hold your tongue, Spiller,' said his sister sharply. 'Tell me, did Alfred Harvey send any message? Did he give you a book?'

'Book? No; he was just driving off in his dog-cart to the station. He was going to see his father and mother; to stop a week. He looked as cross as a bear.'

'Oh, that is a relief,' sighed Lucy.

'Yes, it may be a relief to you,' said Spiller; 'but it isn't to me. Why, there's our last chance gone. After the trick you played that fellow, spy or not, they will be down on me without mercy.'

'Well, you must hear it all, my dear brother; bear it all, for my sake, and his who is dead and gone.'

'They can't hang me for it certainly,' said Spiller, taking his seat at the dinner-table, and ruefully contemplating the scanty meal; 'and as for prison,

I don't suppose prison-fare is much worse than this. They give you good soup and nice mealy potatoes, I know that.'

'I'm sorry there's nothing better for you; but we must live according to our means.'

'You are like the old Border dames, who, when the larder was getting bare, and a cattle-lifting expedition desirable, used to serve up their husband's spurs for dinner. Upon my honour, there would be as much upon a well-greased pair of spurs, as upon this mutton-bone.'

'I wish something would spur you on, Spiller,' said his sister. 'You are welcome to what I have, as long as I have anything; but you really ought to be doing something for yourself.'

'What use my trying,' said the youth fretfully, 'whilst I have this millstone round my neck? The only thing that keeps my creditors decently quiet is the seeing they can get nothing out of me. If I got anything to do, with a salary belonging to it, they would be all upon me in a heap. But where are all your fine promises, Lucy? What has become of the benevolent friend who was going to help us? Where is the money that was going to send me back to Cambridge?'

'It may come to pass yet, Spiller.'

Spiller shrugged his shoulders and began to read the daily paper, which he had brought home in his pocket.

'Look here, Lucy,' he said after a while; 'here is a curiously worded advertisement, and by our friend Elkins too.'

Lucy took up the paper, and read in the second column the following:

'NOTICE.—Bankers and others are warned against negotiating a Bank of England five hundred pound note, No. —, date —, the proceeds of a supposed fraud. Payment has been stopped. A reward will be given for information. Apply to Mr Elkins, Copthall Court, E.C.'

The newspaper fell from her hands. It was her note that was thus described. Payment stopped. Then all her sufferings, all her guilt had been in vain. Supposed fraud. Yes, that was it. A fraud. Apart from all the sentimental glosses with which she had hidden the truth, it was a fraud, and she had been the cheat.

There might be punishment yet in store for her. The note might be traced home to her. But there could be no advantage now. She had sinned in vain. Every avenue of hope seemed blocked, and on every side appeared images of disgrace—defeat and ignominy.

'I suppose you know what comes off to-morrow week?' said Spiller, picking up the newspaper, and attacking its columns once more. 'Here's the advertisement of it. They've put it in all the London papers, but it is to be sold by Bowen at the *White Hart*. "Eligible freehold estate, suitable for residential purposes. By order of the mortgagees. Old-fashioned farm or manor-house." Come, that isn't a very flattering description of Mordieu.'

'Is it the old place they are selling?' inquired Lucy listlessly. A little while ago she thought would have made her miserable, now she hardly felt the announcement as one that concerned her.

'You see the dodge,' went on Spiller, 'why they don't puff it more? Old Dolland, who holds the mortgages and instructs the auctioneer, wants to buy it himself, and doesn't care how cheap it

goes. But he won't get it, for the Chilpruna people mean to have it.'

'They will have us all body and soul, before long,' sighed Lucy.

TREES OF LIBERTY.

We are so absolutely without Trees of Liberty in England, that not merely the things themselves, but their nature and meaning also, are pretty nearly beyond our ken. There have not been many dynastic or national revolutions in this country; and when such did occur, our ancestors neither wore red Caps of Liberty nor set up Trees of Liberty; they shewed their enthusiasm in other ways. But, although Trees of Liberty are un-English, they are associated in their origin with a truly English custom—that of erecting gaily dressed masts on the first of May, and giving them the name of May-poles.

We might direct our glance back to ancient times, when sacred trees were objects of veneration, and when symbolic trees played their part in the beliefs and usages of various nations. The myrtle and the linden were at one time dedicated to Venus, the laurel to Apollo, the oak to Jupiter, the vine to Bacchus, and so on. Entire forests were devoted to some deities. The Gauls and Druids venerated the oak and its parasite the mistletoe. Limiting ourselves, however, to the May-tree or May-pole, it was a custom in Italy many ages ago to plant such trees on the first of May, to celebrate the return of gentle, genial Spring. This custom found its way into various countries—among others, to the English settlements or colonies in America, where it is a known fact that the people rallied round the May-trees or May-poles in the several towns, when they organised a determined resistance to the mother-country just a century ago.

From the fact just mentioned, it will be seen that Trees of Liberty were recognised across the Atlantic several years before the commencement of the French Revolution; but 1790 marks the date when the public mind seized hold of the idea as a kind of passion. In that year, M. Norbert de la Chassagnac, curé or parish priest of Saint-Gandeur, near Civray, in the (present) department of Vienne, set his parishioners an example of enthusiasm in welcoming the nascent liberty of France. He caused an oak-tree to be felled in the neighbouring forest, dragged to Civray, and then planted in the open place of the town, as a central rallying-point for the Liberals (who did not until some time afterwards openly advocate Republicanism). Constitutional municipalities had just been established by an overruling of the court party; and the enthusiastic curé, selecting the first of May as an appropriate day, assembled his flock around the newly planted tree, and addressed them in a speech, the general tone of which may be gathered from these words: 'At the foot of this tree you will recognise yourselves as Frenchmen; and when you are old, you will recount to your children the achievements of the epoch when this tree was planted.' The assembled townspeople were as ardent as their pastor, and

shewed their ardour in a characteristic fashion; all who had any litigation put an end to it at once by friendly arbitration, old wounds were healed up, religious feuds for a while abated their violence, and rich and poor forgot their differences.

Such a scene was sure to be infectious; excited people easily take new excitements from other persons who are as excited as themselves. When an account of the ceremony at Civray appeared in the *Moniteur*, a sort of May-tree madness set in all over France. 'La Patrie' became a sort of new religion, 'Egalité' its chief dogma, and the planting of 'Arbres de la Liberté' one of its rites. A newly planted tree, or a staff or pole in its stead, decked with flowers and the newly adopted tricolor flags, became a rallying-point for the people, who encouraged one another to cherish that emblem of liberty as soldiers would cherish their regimental colours. This was done in Paris, in all the principal towns, and in a multitude of country villages.

As the Revolution proceeded, and moderate reformers had to give way to Republicans, the planting of Trees of Liberty became quite a mania. The ceremonial was often a strange one. A dance with 'hands round' took place, accompanied by the singing of revolutionary songs, such as *ça ira* and the *Carmagnole*. The oddest part of the matter, and that which shewed most strikingly the abnormally excited condition of public sentiment, was the mixture of classes and grades on these occasions. Generals, representatives of the people, even bishops and curés, all joined hands. On one occasion, in the Place du Carrousel, the mayor of Paris and the municipal authorities, decked with their scarfs, danced round a newly erected Tree of Liberty, with work-people, shoe-blacks, and tagrag and bobtail. A French writer remarks that 'it would be impossible now to imagine the Prefect of the Seine, the General Commandant of the Division, deputies, and senators mixing with the people on public fête days, and dancing round a pole; but at that time the reaction against the aristocracy, the public danger, the party spirit, the warm sympathy in the fate of the humble and the youthful, whom the Revolution had brought out of obscurity, the simpler manners that had come into favour, and the doctrines taught by some of the leading philosophical writers—all tended to augment the patriotic eccentricities which so shock cold observers now.' This dancing 'hands round' was carried from the open square or market-place to the camp, where a general might sometimes be seen dancing with his soldiers around the colours, without the dignity of his rank being compromised. Representatives of the government in like manner joined in the popular dances in the open places, around the symbolic altars which were set up at that strange period. 'Egalité' was for the time in fashion; or if not actually so, the rich, the high-born, and the official professed to accept it joyfully, as a means of keeping out of trouble.

The royalists, whenever they could shew themselves, took pleasure in injuring the Trees of Liberty; this they could only do during the night, hacking them and sprinkling them with vitriol. This puerile conduct increased the hatred of the populace, who expressed as much horror at it as zealous religionists would at the desecration of sacred rites. On one occasion, at Rouen, twenty persons were accused of having mounted the white

cockade (an emblem of royalty) and mutilated a Tree of Liberty; nine of them were condemned to death. There can be no question that the populace really regarded this mutilation of the trees as a desecration; how far this was the opinion of the classes above them is a separate question. The royalists, in one instance, shewed veneration for a Tree of Liberty in a rural district, but in an odd way. A band of royalists and peasants defeated a rival band of Republicans in a local outbreak, and celebrated their victory by singing a *Te Deum* around a Tree of Liberty in the open place. The church was closed, as were most churches at the period; but the victors converted into an *al fresco* church a tree set up for a very different purpose.

By the beginning of the year 1793, when these movements were gradually leading to such terrible results, the Trees of Liberty in Paris were not less than two hundred in number; and it was computed that the whole of France contained little less than sixty thousand of them. They were maintained by the local authorities, and were, as we have said, decked with ribbons, flowers, and inscriptions in prose and verse. They served, to some extent, the purpose of municipal offices; for the people assembled around them to take the civic oath, and on other important public occasions. At a time when the (so-called) Religion of Nature was gradually supplanting all other religions, the trees also served as altars for a series of rites and ceremonies. A French writer, Grégoire, says that many of these Trees of Liberty gave an air of lightness, cheeriness, and pleasantness to squalid alleys and frowzy *cul-de-sac*; and he sensibly adds: 'Perhaps we shall one day come to the opinion that it is not only possible but desirable, in crowded and unwholesome localities, to plant trees that in May would tend to joyousness, and would at all times be agreeable.'

In most cases, real trees were planted, but the roots had a tendency to decay, probably owing to unskillful management; and they became mere May-poles. Orders were frequently issued by the authorities of Paris and of the department of the Seine to replant any Trees of Liberty of which the roots had decayed, or rather to plant others in their stead. The National Convention, on the 3d Pluvioso of the year 2 (the revolutionary name for the 21st of January 1794), issued an edict that, in all the communes of France in which such a tree had died, a new one should be planted; this duty, and the maintenance of the new emblem, were confided to all good citizens, 'in order that each commune may possess a Tree of Liberty under the ægis of the Republic.' The date above named was recommended as one specially suited for such replantings, 'to commemorate the anniversary of the just punishment of the last king of France'—that is, the guillotining of the hapless Louis XVI. There was something approaching almost to an equality with the treatment of a hero, in the manner of reverencing a Tree of Liberty which had been 'desecrated' by the hands of the royalists. On one occasion, when a tree had been surreptitiously cut down at Amiens during the night, André Dumont, a commissioner from the National Convention to the department in which Amiens is situated, wrote to his dread masters to denounce the 'fearful atrocity.' He appointed a day for setting up a new tree. The trunk of the old one was carried away to a last resting-place, escorted

by armed men, to the strains of funereal music. A new tree, decked with colours, was planted. The National Guard, the civic authorities, and the government commissioner assisted in throwing earth on the roots. The tree bore an inscription: 'Les Citoyens d'Amiens me défendront jusqu'à la mort. Ce nouvel arbre est transporté en grande pompe pour être planté devant le Temple de la Raison.'

Wherever the French armies penetrated, they carried with them this crazy love for Trees of Liberty; and the few colonies which France possessed sought to imitate the example. Senegal sent a deputation to the National Convention, with the message: 'The colonists here burn with ardour. They assembled, and elevated a Tree of Liberty in the very spot where the infamous traffic in slaves was wont to be carried on.' We must bear in mind, as one good feature in that Revolution, that the freedom of all slaves was decreed by the Republicans; how long it lasted, is another question. Sometimes the Tree of Liberty became a Tree of Fraternity. Two parties of French and Swiss, meeting at a fête in Geneva, set up a tree to celebrate the friendship between the two republics. This proceeding was imitated soon afterwards at Paris, by the planting of a Tree of Fraternity, amid great pomp, in the Place du Carrousel. An oak was brought from the forest of Vincennes for this purpose; but, in most instances, a poplar was preferred, as being tall and straight, and because of the twofold meaning of the word 'populus.'

Trees of Liberty died a natural death when the young artillery officer Napoleon Bonaparte rose into power. He respected no one's liberty but his own, and Republicanism was not at all to his liking. During a portion of the Consulate, it is true, orders were occasionally issued to maintain the trees; but the orders were lukewarm, and it became evident that the former spirit had evaporated. The trees one by one disappeared, partly because the interest in them was gone, partly because they had decayed, and partly to make room for new buildings and streets. A few remained throughout the period of the Empire down to 1815; but the dull Bourbons, on their restoration, ordered these few to be sought out and rooted up.

Fifteen more years passed, and then it was found that the obliteration had not been actually complete and total. The revolutionists who, in 1830, set up the Citizen-King Louis-Philippe as a successor to the Bourbon Charles X., ferreted out a few old Trees of Liberty here and there, made a flourish of enthusiasm about them, and set up several more. Another period passed; another revolution took place; and in 1848, one single tree was found which had been planted as a Tree of Liberty more than half a century before. The young men of the town (Marseilles) redecored this old emblem of Liberty, and made a great celebration around it and many newly planted trees. In Paris there were several Trees of Liberty planted at this time, but the practice did not take. The old spirit could not effectually be revived; and Louis Napoleon shortly afterwards did that which his uncle had done in the early part of the century—threw cold-water on all Trees of Liberty.

Belgium tried its hand at this kind of popular enthusiasm in 1830, when it became an independent kingdom, separate and distinct from Holland;

but the newly planted trees gradually dried up and withered, all except one, which has grown well, and stands awkwardly in the middle of the street, opposite the Royal Palace, in Brussels.

BUTTERFLIES OF THE SEA.

AWAY in the far north of the Arctic regions, floating in myriads upon the surface of the northern seas, and constituting vast fields of life, through which ships may sail for days and nights together, are found multitudes of small animals, to which the appropriate name of 'butterflies of the sea' has been given. To watch one of these beings, pursuing its way through the waters by means of two wing-like appendages springing from the sides of the neck, and to note the delicate body, inclosed in some cases in a delicate glassy shell, the comparison or resemblance to the aerial insect is by no means far-fetched or strained. And in their organization and habits, these little organisms may be found to present some points of great interest to the non-technical reader; whilst to the naturalist they have ever afforded subjects of pleasant study and instruction.

The position of the sea-butterflies in the animal scale is of sufficiently well-determined kind. They are molluscous animals, that is, are allied to our ordinary shell-fish, such as oysters, mussels, &c., as well as to cuttle-fishes and allied beings. Their nearest relations are undoubtedly the whelks, cowries, and other shell-fish, belonging to the great molluscan class known to naturalists as the *Gasteropoda*; and whilst some naturalists regard the sea-butterflies as forming a distinct group of themselves, others, and with every show of reason, maintain that they should be placed merely as a branch of the *Gasteropod* class. The scientific appellation of our sea-butterflies is the *Pteropoda*—a name signifying 'wing-footed,' and which is thus of expressive enough kind, when we consider the manner in which they flit over the watery wastes.

Besides being able to swim quickly and well by aid of their wing-like fins, the sea-butterflies can descend into the ocean-depths, or ascend from these depths to the surface, at will. They appear further to come to the surface chiefly at night or in the twilight; and as a naturalist has well remarked, each species or kind of these animals seems to have its own and special degree of darkness in which it ascends from the depths. Thus, did we know sufficient of the history of these little animals, we might be able to construct a *Pteropod*-clock by watching the respective hours of their appearance at the surface of the sea; just as the botanist forms a 'floral clock' by watching the times of the opening and closing of flowers.

Being 'shell-fish,' the *Pteropods* usually possess a shell; this latter structure, it must however be noted, not being developed in all these beings. A very beautiful, and at the same time most representative kind of sea-butterfly, is that known by the name of the *Hyalæa*, of which kind there are several distinct species; and in this form, as well as in another well-known species called *Cleodora*, a shell is developed. The shell is thus seen to consist of a very delicate glassy structure, somewhat triangular in shape, and of elongated form in *Cleodora*; that of *Hyalæa* being composed of two plates united together, and forming a small shell of elongated or globular shape. The little head-

extremity of the animal, provided with its 'wings,' protrudes in each case from the front or open extremity of the shell. Another very familiar sea-butterfly is the *Clio*, which does not possess a shell, but appears as a little oblong body about an inch in length, and terminating in a lower pointed extremity.

No part of the structure of the sea-butterflies presents more surprising details than that of the head and its appendages; the latter consisting of tentacles, jaws, and like apparatus, exercising the sense of touch and other offices. Thus, on each side of the mouth of *Clio*, we discover three fleshy appendages, which at first sight might appear to consist of simple tentacles or organs of touch. When, however, we bring the microscope to bear upon these bodies, we note the interesting fact, that the surface of each is literally studded over with numerous minute specks, which, when more fully magnified, are seen to be of hollow cylindrical shape, and to contain, each about twenty little suckers. These suckers may be protruded at will from their respective cylinders, so as to constitute an efficient apparatus for seizing and detaining particles of food. Thus if we consider that each of the six tentacles bears, on an average, about three thousand of the cylindrical bodies, and that each of the latter in turn contains about twenty suckers, we reach the enormous number of three hundred and sixty thousand suckers, as constituting the prehensile armament of a single *Clio*, itself of very small size. And imagination may assist us in its scientific aspects better than any other intellectual process, in endeavouring to form some idea of the extreme delicacy of the muscles and structures whereby the protrusion and retraction of the suckers are secured.

Two fleshy 'hoods' serve to inclose the tentacles when the latter are not in use and are retracted; and other filaments exist which may be used to subserve the sense of touch in these forms. Within the little mouth of the sea-butterflies, as also well exemplified in *Clio*, peculiar jaws and a curious 'tongue' exist, for the mastication of food. Each jaw is a conical structure, which literally bristles with sharp spiny teeth; and the 'tongue' is likewise studded over with recurved hooks, which also aid in rasping down or triturating the nutrient matters. And as completing the alimentary apparatus of the sea-butterflies, we find a well-developed throat, stomach, a large liver, salivary glands, and other addenda; whilst a heart is also present, along with a system of blood-vessels for the conveyance of the vital fluid through the body. The breathing-organs in some of these beings are well developed, and appear in the form of delicate gills, or analogous structures, which are sometimes, as in *Hyalæa*, inclosed within a special chamber, but in others, such as *Clio*, are apparently unprotected, and of indistinct nature.

A very large 'brain'—or at anyrate a mass of nervous matter corresponding in function to the great nerve-centre of higher animals—is developed in the sea-butterflies, and can be discerned lying beneath the throat, and forming, in fact, a kind of internal collar around the gullet. And nerves accordingly radiate throughout the body from this central mass, and supply the various parts of the organism with feeling and vital power. Especially, as we might expect, do we find the delicate tentacles of the head to receive a large nerve-supply;

and we may also note the presence of two eyes, situated on the back of the neck. These latter organs are not of a very high order of development, but doubtless subserve the function of guiding their possessors in their marine flights.

It is very curious to observe, that, in the course of their development, the members of the higher class of the Gastropoda already alluded to, at one period evince a strange likeness to the form of our sea-butterflies. The young whelks and their allies first appear on the stage of life as little free-swimming bodies, which move through the waters, each by means of a pair of wing-like lobes which spring from the sides of the head. Observing such a form, we cannot but be struck with its close resemblance to the mature form of our sea-butterflies; a resemblance which is, however, wholly lost as the young gastropod advances further in its development to attain its adult stage.

The food of our sea-butterflies appears to consist of the more minute marine Crustacea, which with themselves, haunt the surface of the sea. Thus these small beings exist on organisms of still lesser magnitude. But in turn the sea-butterflies form a large proportion of the food of the largest of animals—the whales themselves. Drawn in myriads into the capacious mouth of the Greenland whale, with the floods of water which the great monster of the deep from time to time imbibes, the sea-butterflies remain entangled in the 'baleen' or whalebone plates of the jaws, and are thereafter swallowed as nutriment; and the species (*Lio borealis*, from this latter circumstance, becomes known to us under the popular name of 'whales' food.' Sea-birds also prey upon the butterflies of the ocean, which thus contribute largely to the support of much higher forms than themselves. In the Mediterranean Sea, on the Australian coasts, and in the Atlantic Ocean, the sea-butterflies also occur, but not in such numbers as in the far north, whither, to the very home of the Pteropoda, British enterprise has advanced on a noble mission of discovery.

Small as are all the existing representatives of the sea-butterflies, it may prove interesting to note in the last place, that, in past epochs of this world's history, several relatively gigantic members of this class appear to have been developed. In some of the oldest (Silurian) rocks, large shells of Pteropoda are discovered as fossils; one extinct species, known as *Conularia*, attaining a length of about a foot, and a breadth of fully an inch—dimensions these, of giant kind, as compared with the shells of living sea-butterflies. And in more recent rocks, the small delicate shells of our living *Cleodora* and *Hyalæa* may be found in a fossil state; proving thus to us the ancient ancestry of the existing 'butterflies of the sea.'

TATTOOING EXTRAORDINARY.

The following very extraordinary account of tattooing is from an American newspaper, the *Bridgeport Standard*, Connecticut, of May 30th.

'At ex-mayor Barnum's residence we this morning saw a wonder of tattooing on the person of Captain George Costentenus, a descendant of a noble Greek family from the province of Albania. His statement is that while he, together with an American and a Spaniard, was mining in Chinese Tartary in 1867, a rebellion arose, and the three joined

the insurgents. Ill-luck coming to their cause, they were taken prisoners, and subjected to the tattooing process for three months, as a punishment, in lieu of having their heads cut off. He says that the process causes such terrible pain that it required six men to hold him while one performed the operation. After it was completed all three escaped from the prison; but the American only survived five or six months. The Spaniard lost his eyesight, and died in Manila; but Captain Costentenus survives, and is in good health. The tattooing was done with indigo and cinnabar, producing blue and red colours, and there is not a single point on his body which is not covered with these colours, so that it is impossible to discover what was the natural colour of his skin except by his ears and the soles of his feet, which are the only parts they did not cover with tattoo. He appeared at first sight as though he was clothed with very close-fitting tights made of a shawl or of very soft fine druggat. Upon a close inspection, however, it is seen that he is entirely naked, and that the apparent tights are an illusion. Moreover, his whole person is found to be covered with a great variety of animal figures, with their names most ingeniously and skilfully printed into the cuticle. On the forehead are animals and inscriptions, and on the face star-like figures. On the hands are numerous red points and figures resembling sculptures, as well as long-tailed panther-like shapes. On the neck, chest, abdomen, back, and extremities the skin is a mass of symmetrically arranged and admirably executed figures of monkeys, tigers, lions, elephants, peacocks, storks, swans, snakes, crocodiles, lizards, mingled with bows, arrows, leaves, flowers, and fruits; on the palms of the hands are indescribable figures; and little figures are on the inside of the fingers. On the upper side of both feet to the toes are blue points, and from the toes to the nails are red lines. Altogether there are 387 tattooed pictures on the entire body—on the forehead, 2; neck, 8; chest, 50; back, 37; abdomen, 52; upper extremities, 101; lower extremities, 137. The captain is certainly one of the greatest human curiosities ever seen. He has travelled in all countries except America, and is attracted here by the Centennial Exhibition. He spoke English, French, Spanish, and Italian this morning; and he understands the Arabic, the Persian, and several other languages. He is about five feet ten inches high, has a superb physique; his hair is straight, jet black, and glossy. To the touch his skin has a soft velvety feeling, and it has so much the appearance of being clothed that he might walk through the public streets without any one suspecting that he was not dressed in tights. We understand that Mr Barnum has engaged him to travel with his great show at a salary of one hundred dollars a day, and that he will make his first appearance in Providence.'

PRICE 1½d.

A TORNADO ON THE MISSISSIPPI.

Our steamer had touched at Memphis, Tennessee, on a sultry evening in June 1858, and having discharged freight and taken on passengers, we put out, and headed up river under full steam. To enjoy the time and scene more perfectly, I had drawn a chair to the front rail of the veranda-deck, and sat in a lotus-eating frame of mind gazing at the magnificent panorama which every bend up river unrolled before the eye. The glorious flood of the Mississippi upon which we were now sailing, swelled as it then was by the great 'June rise,' caused by the melted snows of the Rocky Mountains, rolls down in majesty towards the sea, giving in its course two thousand five hundred miles of navigable water, and colours the Gulf of Mexico for sixty miles from the Belize with its milky hue.

I was chatting with a gentleman who was engaged in the Santa Fé trade, when suddenly there fell upon us a thick darkness, preceded by a spattering of large rain-drops. I should rather say that we were enveloped in a thick blackness, as if the scene had been almost instantly veiled by a velvet pall. The next moment, and with a roar and thunder-crash so terrible, so deafening, as to almost suspend the action of the heart, a tornado was upon us. Pushing back my chair involuntarily, I felt the deck cant up to starboard, so as to unseat me; and scrambling toward the weather-rail, I heard a terrific crash through the hurricane-deck overhead, as the two great smoke-stacks (or funnels, measuring some twelve feet in circumference) were broken off close to the upper deck, their strong iron stay-ropes snapping like hempen cord, and the entire upper works of the vessel strained out of position.

The rain had become a blinding deluge, the roll and crash of the thunder deafening, and the horrors of the scene rendered more awful by the rapid flashes of sheet-lightning which momentarily lighted up the tumultuous river, now raging like a mad whirlpool. Fearing that the whole upper works of the boat would go by the board, I crawled to the larboard stairway leading to the hull-deck, and

proceeded to pull myself down, which it required all the strength of desperation to do, against the solid force of the wind; but on gaining the lower steps of the flight, I found a group of the deck-hands, and the mate (a herculean man of iron courage) urging them with terrible oaths to do something which he wanted done, but which their wild terror rendered them powerless to execute. Some four or five of their number had been blown overboard and lost, and the remainder were now deaf to anything but an impulse to cling for dear life to something or anything, in the darkness and terrors of the time.

The conviction instantly flashed on me that, in the event of the vessel going down, there would be no chance for life in my then position; so, lifted rather than crawling up the stairway, I regained the cabin deck, where, on my hands and knees, passing round the larboard side, I came to a door-way leading into the saloon. Entering this, I found everything in confusion, the furniture being all displaced. But the pendent lamps were still alight, and the relief of being able to see was very great, though counterbalanced by the feeling, that at any moment the whole cabin or boat might heel over and be swallowed up in the maddened river. I crawled into my state-room to secure a life-preserver (two of which were in each berth); and on coming out saw, seated against the lower side of the cabin, one of our passengers—an invalid far gone in consumption, who had been in California, and was now returning home to die. He sat calm and collected amidst the outcry and wild confusion that prevailed throughout the saloon, and addressing me, asked if there was another life-preserver there.

'Yes,' I replied, 'there is.'

'Will you give it to me?' he continued, 'as I'm not well able to help myself, and the folks here are so mortal skinned, I can't get any of them to do me that favour.'

Returning quickly to the state-room, I procured a life-preserver; and handing it to him, asked hurriedly, whether he would take his chance in the cabin, or if I should help him outside.

'No,' said he; 'I'm obliged to you; but look out for yourself. I'll stay here—it can't make much matter now.'

Passing out on the door I had entered by, I felt my way forward to a ladder-way leading up to the hurricane-deck; my idea being, that if the boat heeled over, I would be in a better position there, as not being liable to be caught by any top-hammer in her going down. On reaching the opening to the upper deck, I found that one of the smoke-stacks, in falling, had crashed through a portion of the steering-house, and lay partially over the aperture through which I had to pass—the space left being barely sufficient to allow the forced passage of my body; this I essayed. Having succeeded with difficulty, I lay flat in the vicinity of the texas, as the cabins on the upper deck appropriated to the pilots are called.

I had been in this position but a few minutes, when, with a splintering crash, the larboard wheel-house was blown into atoms, as if it had been paper; and at the same time the pantry on deck below was smashed in—its contents making a din which was audible above the storm—and gave the idea that the machinery of the boat had given way. A vivid flash of lightning shewed me a twenty-foot ladder lying a few yards aft, towards which I drew myself; and pulling off a black silk handkerchief from my neck, I tied my left arm above the elbow to the last rung, in order that, if carried down by the swirl of the boat, the ladder would help to bring me to the surface, even should I lose my hold. Another flash of sheet-lightning, and I saw a man at the other end of the ladder, and he seeing me at the same instant, shouted: 'How long before she goes down?'

I shouted back to him: 'The wheels are still in motion: she may reach shore without going over—keep cool. Is the ladder free at your end?'

'Yes,' he answered, as I felt him try it.

'We'll know our fate in five minutes,' I added, and neither of us spoke again. Oh, those five minutes! never have I passed such in the course of a long diversified life, and I trust never shall again.

I had tried in vain to get off my boots and coat, the blinding rain and the force of the storm preventing a successful effort; and as I lay with quickened breath, expecting the instant climax, there was a dull heavy thud, that made everything shake, a bright flash of light from the lower deck, as the furnace-doors were flung open, and above us we saw the steep clay bank and dark outline of the forest trees of the Tennessee shore, against which we had been driven. I instantly began to free my arm from its lashing, but the silk handkerchief having strained, made it difficult to unloose its knot. While so engaged, I saw the man who had hold of the other end of the ladder, dash wildly across the deck towards the top of the starboard wheel-box, evidently intent on jumping from it to the steep and crumb-

ling bank which now overhung us. Not being yet free, I could not rush to stop him, so, shouted with all my might: 'Don't jump!' But not hearing, or unheeding me in his terror, he sprang, and was lost. Getting loosed at last, I made my way quickly to the lower deck, where a terrible scene of tumult and confusion presented itself. The open furnaces gave abundant light, and the boat was held against the bank by the force of the wind, but was being slowly moved down stream with a grating motion, influenced by the current. The captain and crew, with many of the passengers, were in a group on the forward deck; the former, silent and quite unmoved; but the mate—with no clothing on him save a red flannel shirt, the sleeves rolled above the elbow, and pantaloons thrust into a pair of long cowhide boots, his thick hair hanging in drenched masses about his face—rushed forward with a broad axe in his hand, and in a voice which rang above the din of the elements, shouted to the crew: 'Stand by, every man of you! I'll ent down any one who don't do as I tell him. Get out a plank here; go ahead with larboard wheel; up with that plank—up with it!' he roared, as a long stout plank was run up at a sharp angle to the top of the bank. 'Bring a rope!' he continued; and seizing an end of it when brought, he took one of the most active of the crew, passed it with a double half-hitch round his body, under the arms, and thrusting him forward to the deck-end of the plank, shouted: 'Six of you here, stand by this plank, and keep it fair.' Then addressing the man with the rope, he said: 'Up with you, and make that rope fast on the bank.'

'I'll never be able to get up that plank, Mr —,' said the man, hesitating.

'Up with you!' shouted the mate fiercely, at the same time pushing him on to the plank, up which, thus urged and helped, he scrambled on hands and knees, ever and anon slipping in his effort. 'Pay out! slack the rope, one of you; bring a pole here!' shouted the mate; and seizing it when handed to him, he pushed it up after the man. 'Put one foot on the pole; grip hard; look alive! You'll do it!' he cried, as all eyes were bent on the poor fellow, who was doing his best to obey orders.

Notwithstanding the help of the wheel, the boat was all this time drifting, and there was great difficulty in keeping the plank from swaying or being overturned as it passed along the uneven edge of the bank. Once or twice the man was all but turned off from his perilous position, saving himself only by clasp of both arms and legs; but at length he won the top, and scrambled on shore amid the cheers that involuntarily burst from all present except the mate, who grimly shouted: 'Shut up! Pay out the rope; look alive, you up there; make fast!' and presently there came back from the bank above the cry: 'All fast, sir.' The rope being now secured on the boat, we lay steady; and the tempest, which had been

moderating for some minutes, passed away almost as suddenly as it had come upon us.

The sky was as it seemed unveiled, and we could now see our position clearly. We lay on the east shore, opposite the southern point of Flower Island, and presented a pitiable appearance of wreck. The hull was safe, and had been partly prevented from overturning by its heavy cargo of sugar hogsheads; but mainly by the heroic action of our pilot, who stood to his wheel faithfully throughout the fearful ordeal, and succeeded in keeping her head to the tempest, which, had it taken her broadside, would have inevitably capsized her. I will here describe the pilot and his action. In person he was a thin, delicate-looking man of about thirty years of age, a native of Nashville, Tennessee, of a silent habit, and the cast of his thought tinged by a deep but quaint seriousness. I had spent a good deal of my time on the voyage in the steering-house, and became much interested in him; the more so, as I could not but see that he was suffering from consumption. He felt and spoke as if his life would not be a long one, and was given to speculate on the existence which lies beyond the stars. He was in charge of the wheel when we were struck by the tornado; and I append his account of the circumstances as narrated to me that night.

When I sat with him in his cabin, and he had so far recovered from exhaustion as to be able to converse, he said to me: 'I had headed her out to pass close by Flower Island, and cut off the bend, as well as to escape the current which sets into it; when I saw the storm coming, and had only time to pull the wheel hard down, so as to bring her head to it, when it became so black that I couldn't see, and thought I had been stricken blind by the lightning. She didn't come up quick enough to the helm; and the next thing I knew was the breaking of the smoke-stacks, the larboard one falling on the steering-house close to me, and smashing it right down to the deck, the remainder of the light work of the house being blown away; and I had to turn my back to the wind as much as I could, to catch my breath. I next heard the wheel-house go; and when the pantry was blown in, I *did* believe she had burst up. I began to feel my arms giving way from the strain, but I knew that if I *let that wheel up a point*, she'd go right over; so I got my feet jammed against the wheel-frame, and held on like grim death until she took the bank; and when she did strike, I was so fastened on to that wheel, that I couldn't let it go for some time.'

I asked him how he felt, and what he thought at the time. 'Well,' he continued, 'I *felt* that it was all up with us; but I *thought* just of one thing, and that was, to hold the wheel hard down until we struck. Well, when we did strike, and they threw open the furnace-doors below, and that I found I was not blind, I felt good; but was so played out by the excitement, that I could scarcely crawl down to my cabin, all energy seeming to have left me when I let go!' Such was the account of this brave and modest man, who, had he been less heroic, would have endeavoured to save his own life by leaving the wheel, although in so doing he would almost certainly have lost it and also those of all on board. And here I may say that his was but an instance of the courage, devotion, and faithfulness which have at all times distinguished the pilots of the Mississippi, one of whom, not long before, had stood at his wheel

when the boat had taken fire, and held to his post until he had beached her, whereby the lives of all on board were saved except that of the heroic man himself. Like the famous James Maxwell, he remained faithful to his charge, and was burned to death, though he might have saved himself by jumping overboard, had his soul been compounded of any less noble element than that which impelled him to sacrifice his own life to save those of the passengers.

We had not been moored more than half an hour, when a great portion of the bank against which we lay 'caved in,' and falling on the guards of the ladies' cabin, carried them sheer down, depositing some fifty tons of earth on our lower deck. All hands, crew and passengers alike, had to turn to at once and clear this off, so as to right her. It was a work of great labour, and had to be done in a hurry, as we feared another 'slide' might take place. When we succeeded in getting her on an even keel, the mate gave orders to cut the mooring-rope, and let her drift until we reached a safer bank. This was done; and about a mile down stream we came to a woodyard, where we tied up, to repair damage and count loss. As to the former, we found, in addition to the broken smoke-stacks, that the whole upper works of the boat had been wrenched from position, one wheel-box gone, most of the deck-cargo lost, and rudder strained. As to loss of life, some five of the deck-hands and three passengers were missing.

By the afternoon of next day, we had so far repaired damages as to continue our voyage, but had to organise relays of the passengers, forming gangs, which 'stood by' with buckets of water passed up from below, with which the showers of sparks, which were continuously poured out by the stumps of the smoke-stacks, were extinguished as they fell thickly over the hurricane-deck. A thick fog fell as the sun went down, and being off duty, I had gone to my state-room, and lay down to rest. Being much exhausted, I fell asleep almost immediately, and had been so for about an hour, when I was suddenly thrown with violence out of my berth, and heard at the same instant a general crash. As soon as I recovered my senses, I thought that the boilers had burst, and rushed into the saloon, where the tables, chairs, panel mirrors, &c. were strewn promiscuously on the floor, and the passengers rushing wildly about asking what was the matter. Picking my way quickly out on the forward gangway, I heard a great hubbub on the lower deck, the voice of the mate rising above the din: 'Starn all! full speed! man the pumps there,' &c. Going down, I found that we had run full speed head on against the bank, the fog being so dense that you could not see anything a rod off. The consequence was that we had bent our keel, sprung a leak, and were making water very fast. The pumps were vigorously plied; but after an hour's hard work, the carpenter reported the leak increasing. Here again the resourceful judgment of the mate came to the rescue. He got the greater portion of the sugar hogsheads taken up from the hold, and placed one half away ast, and the other well forward, and thus, as he said, 'straightened out the back-bone of the darned thing;' the result being that in two hours we had pumped her dry, and went upon our way rejoicing, reaching Cairo that night. At that point I left the boat, to proceed to St Louis, while she

went upon her voyage up the Ohio ; and as I stood on the landing-stage and saw the extent of the damage she had sustained, I had a realising sense of the force and fury of the hurricane, which had so nearly proved fatal to all on board.

F A L L E N F O R T U N E S.

CHAPTER XXXVI.—BEREAVED.

WHAT change happens to those who have cast off this mortal coil, He only knows who has put it for a brief span upon us ; but it can hardly be much greater than that which befalls the living whom the beloved ones have left behind them.

To know they have departed,
Their voice, their face, are gone ;
To feel impatient-hearted,
Yet know we must live on,

is an experience that transcends all others in this world. The vacant chair in the household that has been knit together in bonds of love, has all the sacredness of the altar, and ten times its suggestiveness. For the time it seems as though the sun had vanished from the skies and all was dark. The home has lost its charm, and is more hateful, because more full of bitterest reminders, than any stranger's roof. We weep, we plead, we beat against the gates of heaven, to call the lost one back—in vain. What is wealth, or health, compared with that which yesterday we thought but a common blessing, taken as a matter of course, treated as though it would remain with us for ever, and now is gone ! O cruel Fate ! un pitying Arbiter ! O Worker of Desolation and Despair !

'Tis better to have loved and lost,
says one,

Than never to have loved at all.

It may be so, but that is too hard a saying for us even to understand, much more to derive comfort from it ; for the love of the departed one was a portion of our very selves, the spring of our every action, the theme of our deepest thought, and he has left us for ever. It is idle to tell us we shall meet again. What consolation is it to the child who weeps and clings, when sent from home for the first time to school, that there will be holidays at midsummer ! And we are in worse plight than he, for we are not sure—the very best of us are not quite sure—that there *will* be holidays. And if there be, what change will not be wrought in us. We may be children then no more ; and he too that has gone before may be unrecognisable. 'Death is common.' 'All is for the best.' 'It is the will of God.' Ah, well ! these trite sayings may be offered to us with the best of intention, but do they *always* bring with them Peace and Comfort !

Think of the Nook in Sanbeck, with the snow without, and the pale corpse within ; the orphaned girls and Tony, well nigh penniless, well nigh friendless, with their helpless charge, but one day old. There are tens of thousands in the land in worse plight than they ; and tens of hundreds, rich in this world's goods, who complain that they have no object in life, and devote themselves to Ritualism, Exeter Hall preachings, or old china, in default of it.

The man who had killed Mrs Dalton was poor Mr Marks, the butler at Riverside, who had

thoughtlessly wrapped around Mr Mudie's books that fatal *Times*; but he was after all but the immediate cause of her decease ; she would have died any way—so Dr Curzon said—in bringing that new life into the world. For weeks she had dragged on with a breaking heart ; consumed with unutterable apprehensions upon her husband's account ; uncheered by hope ; and laden with anxieties for her children's future. 'If she ain't gone to heaven, sir,' observed old Margate in confidence to Dr Curzon, 'there ain't no such a place.' An observation worth a good many beaten-out and attenuated remarks to the same effect, which were made by others on the occasion.

They laid her in the sunniest spot of the little God's-acre ; the purest embodiment of good it had ever known ; and many a genuine tear was dropped for her from eyes unused to pay such tribute. Dr Curzon was deeply affected, and Mr Campden also. Kind Jeff, whose coming down from town for such a purpose was stigmatised by a certain lady as 'a most ridiculous act of extravagance,' was among the mourners, and wept almost as bitterly as little Tony himself. The two girls accompanied the body to the grave, as likewise did Mrs Campden and her daughter.

'I would go much farther than to Sanbeck churchyard,' said the former, 'to shew my respect for the memory of dearest Elith ;' and there is no reason to doubt her word ; though there would probably have been limits as to distance.

She meant to be kind after her fashion, but she was certainly not judicious in entering as she did upon the material aspect of their affairs with the poor mourners on the very day on which their mother had been laid in her grave. Her daughter and herself had returned with them to the Nook after the funeral ; while her husband and the doctor, with Jeff and Tony, were taking a walk towards the mere, when the melting of the snow during the previous week—one of sunshine and comparative mildness—enabled them to do. 'It is so much more easy for men to escape from disagreeable scenes than women,' as Mrs Campden justly observed ; although she might have added, that certain scenes disagreeable to all men are not so to all women. We do not mean to say that Mrs Campden absolutely enjoyed her visit to the Nook upon the present melancholy occasion, but without doubt it had some pleasing features for her. It was an occasion that in many senses—could be improved, and she was fond of improving an occasion. Without exactly putting herself in the place of the girls' 'natural protector'—which would have involved something beside privileges—she was in an undeniable position for offering advice, if not for absolute dictation ; and for playing the patroness as far as that game could be played for 'love.' As their only kinswoman, she had really succeeded to some authority over them, and Kitty, at least, was willing to admit it.

'My dear girls,' said she impressively, 'you have a right to look to me in future—for counsel ; and God willing, it shall never be denied you. Your dear mother's death has in no respect altered your position in my affections, unless it be to make you dearer to me. I am sure my Mary feels the same.'

'Kitty and Jenny both know that, mamma, without my telling them,' said Mary brusquely. She had a consciousness, quickened by a certain

expression in Jenny's eye, that this speech of her mother's was not quite what it should be, or at all events, that it was not very warmly appreciated.

'My dear child, in a solemn hour like this, one should not only think but speak the words of cheer. It has pleased an inscrutable Providence to deprive your cousins of their natural guardian; indeed, there is only too much reason to fear, of both their parents. They are unhappily also left but slenderly provided for. Under these circumstances, it behoves those who love them to speak with tenderness, yet with decision. It is impossible at their age that they should know the world, or what is best for them to do in the world; and it is my duty to tell them that in reality their choice is very small. Even with the experience of their good mother to aid them, they have found it hard, I fear, to make both ends meet; and they will find it still harder now.'

'Do you call these "words of cheer," madam?' inquired Jenny suddenly, with the air of a person who asks for information.

'They are words of truth, at all events, my poor girl,' answered Mrs Campden pityingly, 'as you will surely discover; though, indeed, I was not addressing myself so much to you as to Kate.—Well, in this your extremity, as I may truly call it, a friend has unexpectedly proffered his aid.'

'Mr Holt, I suppose?' said Jenny coldly.

'Yes; it is Mr Holt, Jane; though I don't know why you should suppose any such thing,' answered Mrs Campden reprovingly. 'You have no claim upon his good offices, so far as I know, in any way. Yet only consider what he has done. From the moment that that dreadful paragraph appeared in the newspaper which has already worked such woe—poor Marks is quite broken-hearted about his share in the matter, and I hope it will be a lesson to him never to act without thought, as long as he lives—I say, ever since these miserable tidings came to England, Mr Holt has been moving heaven and earth to get your father's insurance money paid.'

Kitty started to her feet. 'What! is there, then, no hope?' cried she.

Jenny trembled in every limb, but remained silent. Her courage was greater than that of her sister, but her strength was small.

'I fear that there is very little hope, Kitty,' said Mrs Campden quietly. 'We must not disguise from ourselves what has really happened. The ship is many weeks behind its time, and has been already "written off"—I believe that is the phrase—at Lloyd's; and then there is this shattered boat picked up belonging to it. The *Flamborough Head* is painted on it. Nothing can be more morally conclusive. On the other hand, there is a difficulty about the payment of your father's insurance by the *Palm Branch*, because his death cannot be substantiated. Mr Campden could tell you all about it, because he is a director of the Company, but he naturally feels a delicacy in talking of it. From his very connection with the matter, his lips are in a manner sealed.'

'Why?' inquired Jenny.

'My good girl, I wish you would not speak so brusquely. It is positively startling. You must really get out of that curt manner, which is the reverse of conciliatory. Of course I don't mind it myself, that is to say seriously—but others may take objection to it; and under present circum-

stances it behoves you to make no enemies, but all the friends you can. The reason is surely evident enough why my husband, being a director, and indeed the chairman of the *Palm Branch*, can take no steps that may prejudice its interests on behalf of a personal friend. The Company has for the present refused to pay, and in the meantime money will be wanting to you for a hundred things—for what has happened to-day, for one. Forgive me for alluding to matters that must needs give you pain; but this is no time for false delicacy. Well, you want money at once, and for the present the *Palm Branch* will not pay the sum to which you would be entitled if the fact of your father's death could be established. Under these circumstances, the kind friend of whom I speak has offered to advance you whatever may be required.'

'That is very generous,' said Kitty softly.

'The advance would be made on the security of the insurance,' observed Jenny.

'Well, yes; of course it would. But if your father is alive, the loan is lost, for where is he to find the money to repay it?'

'Then in that case Mr Holt would be giving us the money, would he not?' continued Jenny.

'Yes, indeed; and there are very few persons, let me tell you, who would make so noble, so large-hearted an offer.'

'Let us hope there would be also very few persons who would accept it, Mrs Campden.'

'Jane, you must be mad!' cried Mrs Campden angrily. 'Kate, if you have any influence with your sister—for it seems I have none—I do trust you will exert it for her own benefit. She does not understand her position.'

'You are wrong there, Mrs Campden; thanks to your plain speaking—a duty, as you call it, in which you have never failed since our misfortunes began—it is quite impossible that any one of us could misunderstand it. Kitty, of course, will do as she thinks proper; but for myself I do not take one shilling of this man's money either as loan or gift. I would starve first.'

'My dear Jenny!' cried Mary with a little scream; 'pray, don't say such dreadful things. Mamma always exaggerates, you know; things are not so bad'—

'Be quiet, Mary,' interrupted Mrs Campden very sharply; 'you are talking like a fool. If things are not so bad with your cousins, it is only in the sense that they are not so bad as they may be. It is impossible to imagine a darker future than awaits them, should they decline this opportune, and I must say most delicately offered aid. Fortunately, the decision does not rest with Jane, but with Kitty. She is the house-manager, and knows how matters stand; and with the debt for her mother's very funeral hanging over her head'—

'Stop, stop!' pleaded Kitty pitiably. 'Do not talk of that to-day, I entreat you. Give me time—a few days at least—to think over what you have said, and then you shall have my answer.'

'You will do as you please, my dear, of course,' replied Mrs Campden, with a pitying smile; 'though why you should hesitate even for a moment is inexplicable to me. However, so be it.—And now I have a proposition of my own to make, which has the merit, at all events'—here she threw a meaning glance at Jenny—'of being open to no misconstruction. It is my intention for the present, at all events—to provide for the

little baby. It is strong and healthy enough, Dr Curzon says, notwithstanding its somewhat premature arrival; so that a wet nurse is as unnecessary as it would under the circumstances be unjustifiable; and our lodge-keeper's wife, Mrs Hardy—who, it seems, had a great affection for its poor mother—has consented to take charge of it. We have plenty of cows, you know'—

'O please, Mrs Campden, I couldn't do that,' interrupted Kitty decisively. 'The baby is the greatest comfort we have left to us. It is never out of my arms or Margate's, and she understands all about it quite as well as Mrs Hardy. The milk is as good here too as at Riverside'—

'My dear child, that is not the question,' put in the other emphatically. 'The question is, do you get the milk for nothing? Why, of course you don't; and therefore to keep the baby would be an act of extravagance.'

'My dear mamma, I never heard of a baby being an article *de luxe*,' said Mary, smiling.

'Very likely not; but your cousins are unfortunately in a position to feel it as such,' returned her mother gravely. 'It is not as if you would be separated from the child by any distance, Kitty; and then when you come over to Riverside, you could always see it. And if it was seriously ill, I should take care to let you know, of course.'

Poor Kitty's face had been growing longer and longer throughout this speech; for the baby was inexpressibly dear to her, as well on its own account as on that of her mother, of whom it seemed to be a portion. Jenny could find forgetfulness of her miseries in reading and writing; but for herself, the soft snoozie little form she rocked to sleep upon her bosom was her only cure for the headache. When Mrs Campden talked so calmly of its being 'seriously ill' miles away from her, Kitty shuddered.

'Indeed, I could not part from the baby, Mrs Campden; 'it is almost the greatest treasure I have left in life; and I don't think,' added she with a faint smile, 'it is a very expensive luxury.'

'You know your own affairs best, my dear,' answered Mrs Campden coldly. 'I meant nothing but kindness by my offer.' And she rose, and pruned down her black silk and crape, in sign of light. 'We have put up our horses at Farmer Boynton's, so that no unnecessary expense should be imposed on you; and I do hope you will be as considerate for yourself, Kitty, as your friends are for you. You understand what I mean. Now I do trust to hear from you to-morrow or the next day that your foolish scruples with respect to the offer of our common friend have been overcome.' She kissed Kitty as she spoke; but Jenny had already betaken herself from the room, and Mrs Campden perhaps was not displeased at the circumstance. She was not so indifferent to Jenny's brusqueness as she affected to be; the plain speaking on which she piqued herself was very unwelcome to her in others; and besides, Jenny had a habit of quietly ripping up her satin speeches, and showing the seamy side of them, which made her particularly dislike that young lady. Of the baby, on the other hand, Mrs Campden took a gracious leave; the woman's heart must be had indeed that does not warm to a baby; and yet its infant charms by no means so intoxicated her as to warp her practical good sense.

'It's a dear little baby,' said Mary; 'is it not?'

as she and her mother crossed the bridge towards the farm.

'Yes, indeed; and healthy too; though, under the circumstances, one can hardly wish that it should live.'

'Fie, mamma, how you talk!' returned Mary, not a little shocked. It was creditable to her to have retained her susceptibilities so long; her mother's honest speech and high principles still gave her rather 'a turn' occasionally.

'Well, the point is, what is the poor little creature to live upon?' returned the elder lady. 'Even when Mr Dalton's insurance money is paid, there will hardly be enough for three months, much less for four. I suppose you don't wish your papa to be saddled with the maintenance of a second boy for all his life?'

'Well, that does seem hard upon us, certainly,' answered Mary, her thoughts reverting to Jeff with some disfavour.

'Of course, it would be hard—in fact, it is out of the question; and yet you say (rather disrespectfully, I must needs remark), "How you talk, mamma!" when I say it is no charity to hope the child may live.—If the carriage is ready, I shall not wait for your father: it will do him all the good in the world to walk home; and I am sure the accommodation at the farm is not at all what our horses are accustomed to.'

In a few minutes the carriage drove by—close to the new-made grave—with the two ladies sitting in it alone.

ABSURDITIES OF MODERN CREDULITY.

Those who are labouring, either as individuals or in social institutions, to raise the level and improve the tone of life among the mass of the people, are repeatedly confronted by disheartening evidence that gross superstition, ignorant credulity, still exist amongst us to a lamentable degree. Even comfortable farmers with their wives and children, small shopkeepers in country towns, and working men and women in large towns, are to be found among the dupes of fortune-tellers and witch-finders; albeit servant-girls are the most numerous victims. Whether, through the agency of School Boards and Board Schools, education will reach down deeper into society than it does at present, the next generation must shew; but nothing less than mental improvement, whether given by schools, by healthy literature, or by other agencies, will cure the evil. To prove that we are not overdrawing the picture, it will suffice to give a few jottings so recent in date as within the last ten years, mostly derived from authentic police reports.

At Madeley in Staffordshire, in 1867, a man went into a neighbour's house, and there found a child troubled with severe cough. The father had delayed sending for a doctor until he had tested the efficacy of a remedy which he declared had never failed. This remedy or charm consisted in cutting a few hairs from the part of the patient's head where it joins the neck, placing them between two thin slices of bread-and-butter, and giving them to a dog to eat. Resisting his neighbour's expostulation at such an absurdity, the father of the child administered this delectable sandwich to a dog; if the animal had sickened, a doctor for the child would have been sent for; but as Rover did

not seem to care much about it, the invalid was left to recover without medical aid.

At Stratford-on-Avon, in the same year, a whole family held firm to a belief that they were visited by beings of very exceptional character—sometimes a human creature carrying his head under his arm; sometimes a headless being that descended the chimney; sometimes a headless couple that tossed the beds and the inmates about, and made havoc with the furniture. Neither ridicule nor serious talk could shake them in this belief; they declared themselves to be bewitched, and that relief could only be found by drawing blood from the person supposed to be the witch. Unfortunately for her, the foolish people suspected a woman named Jane Ward, who lived a door or two off. The father pounced upon her one day, held her firmly, and cut her face with a knife. The family professed to be at once relieved by this mode of breaking the spell; they all slept well that night, which they declared they had not done for some time previously. Jane Ward of course did not approve of such an extraordinary proceeding; and the magistrates committed the man on a charge of cutting and maiming. If the memory of Shakspeare has refined his birthplace, this refinement certainly had not reached the family in question.

About the same period, the law had to mete out justice to an evil-doer in Devonshire, who had met with a dupe of almost incredible silliness. A labouring man at Modbury, whose wife had an attack of paralysis, believed that she was 'ill-wish'd' by some one—apparently a modification of the old belief in the 'Evil Eye.' Having heard of a woman at Plymouth possessing magic power, he went and sought her out, as a means of ascertaining who was the ill-wisher. The 'wise woman' was equal to the occasion. She told him that his wife would have to 'see the planets' and to gather certain herbs in the churchyard for twenty-one nights. Moreover, certain powders were to be burnt in the fire, one in the morning and one in the evening, and the ninety-first Psalm was to be read during the burning; a 'skin' was to be worn round the neck, put on for the first time on a Sunday. A piece of parchment was given to him under the name of a 'charm,' bearing cabalistic signs or hieroglyphics, with a few sentences—'Whosoever beareth this sign, all spirits will do him homage;' 'This sign against witchcraft, putrid infections, and sudden death;' 'Whoso beareth this sign need fear no foe;' 'This is a sign against witchcraft and suicide and evil demons.' The foolish man lent a willing ear to all this; and as he had saved a little money, he became a welcome dupe to the wise woman, who fleeced him to the extent of more than four pounds. As his wife became more 'ill-wish'd' than ever, or at anyrate more paralysed, his eyes were opened a little; he told his grievances to a magistrate, and imprisonment with hard labour was allotted to the wise woman.

In the fashionable town of Tunbridge Wells, a married woman, touched with jealousy, went in 1868 to ascertain whether a fortune-teller could confirm her suspicions. The fortune-teller, an old man, replied in the affirmative, undertook 'to bewitch the other woman' by burning a certain chemical; and money was given to him to buy the chemical. The wife, on returning home, and

being attacked with rather sudden and severe pains, suspected that the man had bewitched *her* instead of the other woman. This absurd idea led to a charge being brought against the man for wrongly bewitching; but the magistrates resolved it simply into a case of obtaining money under false pretences, and punished him accordingly.

The same year presented an incident at Newbury, strikingly illustrating the proverb that 'A fool and his money are soon parted.' A countryman lost his watch, and consulted a 'cunning woman' about it. She undertook, for a fee of twelve shillings, to shew him in a glass the man who possessed the watch. On the silly noodle giving her the money, she brought a sort of birlage glass, and requested him to look in it; he did so, and saw 'something that looked like a man's whiskers, but no face.' He paid a second visit, and gave her money to buy some 'stuff' at a chemist's. The 'cunning woman' went to his house next day, took tea with him, told him that the person who had the watch was 'very hard-hearted,' and demanded nine or ten shillings wherewith to buy some more 'stuff.' Another day came, and with it a demand for more money, which the dupe gave; and so on until forty-five shillings in all had been thus transferred. All the instructions she gave him was 'to keep at home till midnight, when the man who had the watch would bring it.' Of course the watch never made its appearance; and the only consolation for the Berkshire man was to get the 'cunning woman' punished for fraud.

A married woman at Cuckfield in Sussex, being affected with some malady which her friends could not understand, imputed it to witchcraft. A 'cunning man,' who had a 'book of necromancy,' was consulted. His book told him that a charm must be tried at midnight preceding the Sabbath, the planets being favourable. The cunning man and the friends of the sick woman met secretly, provided with some new pins, which were stuck in certain positions; something was burned, jargon read out of the book, ejaculations uttered in a commanding tone, in the expectation that an invisible witch would be driven up the chimney. Prying neighbours, however, spoiled the charm; and the woman's illness had to be attended to by a medical practitioner.

A mixture of witch-credulity and spiritualistic-credulity shewed itself in a singular way, in an advertisement which appeared in one of the journals devoted to that class of subjects. 'A gentleman being bewitched by a hired man-witch in his immediate neighbourhood, hired and avowedly paid during thirty-five years a fixed sum of money yearly by miscreants for his criminal services . . . would be glad to meet with any Medium who might be able, by spectral sight, by clairvoyance, or by trance, to afford such clue as might identify the said man-witch.' Poor gentleman! his mind was evidently thrown off its balance by some one of the brain-diseases which now occupy so much of the attention of thoughtful physicians.

A delusion, at once sad and ludicrous, took hold of a Devonshire youth a few years ago. He was subject occasionally to epileptic fits, and anxiously sought for preservatives from his malady. On one occasion he was known to stand outside the parish church, and collect a penny each from thirty unmarried women, wherewith to purchase a ring to wear as a charm against fits!

In 1870, a woman in Barnstaple market-place was suddenly attacked by an old man, who scratched her with a needle, drew blood, and exclaimed: 'You have had power over me long enough, and now I will be revenged!' The aid of a magistrate being obtained, the old man declared that he had suffered affliction through her for four years, that he had had four complaints upon him at once, that he had lost fourteen canaries and about fifty goldfinches; and 'more than a hundred persons' had told him that he would get rid of all his troubles if he could only 'fetch' the blood of the old woman. He was rather disconcerted at being punished for adopting this singular mode of disenchanting himself.

The belief in a mysterious power attributed to a corpse by some old superstitions is almost incredible. At Bewdley, in the year just named, a man was found drowned in the Severn. When the inquest was over, a woman came, bringing with her a boy afflicted with many unsightly wens on the neck. She begged permission to draw the boy's hand nine times over the deceased man's throat, in order that, as the body decayed and wasted away, so might the boy's wens! The chief constable (rather unwisely, we think) acceded to this strange request. About the same time a Suffolk man died of typhoid fever, and superstition led to deplorable consequences. An old 'wise woman' persuaded a neighbour, whose son was afflicted with some disease, to submit the diseased part of the boy's body to the touch of the dead man's hand. The typhoid was communicated to the poor boy, from him to other members of the family, and from them to the neighbours; several deaths occurred, and the village long remained in a tainted state.

Two young girls went to consult a Berkshire fortune-teller in 1871. She shuffled a pack of cards, made a mighty fuss with them, and declared that they revealed the word 'London'; that one of the girls would obtain a good situation there, and then marry a widower; that the other would fare even better, and be married to a gentleman with plenty of money. She induced both girls to obtain goods from tradesmen in the town, and bring them to her house, also wearing-apparel, promising that she would send these articles to them when they reached London. The mother of one of the silly dupes detected the fraud just in time. It was only a case of fortune-telling cheatery, but it shews in how many forms this stupid credulity manifests itself.

In the same year, a well-to-do farmer at Hechester, a shrewd man of business, was troubled with a strange fatality among his cattle. Believing that they had been 'overlooked' by a witch, he applied to a 'wise woman' to remove the spell. Acting on her advice, he heaped up a pile of fagots around the body of the animal that had last died, buried the carcase, and pronounced over it an incantation she had provided. A veterinary surgeon was also called in. The remainder of the herd recovered; but the farmer and his neighbours attributed the good result to the 'wise woman' rather than to the surgeon.

In 1872 the Dorset magistrates had to try a 'cunning man.' He had undertaken to cure an epileptic idiot boy, and secured the poor parents out of nearly twenty pounds in eighteen months—partly for supposed benefit to the boy, partly to charm away an evil spirit which the father

believed himself to be haunted with. The wife was more credulous even than the husband, and was the chief agent in holding interviews with the knave, and paying him money.

At Payhembury, in the neighbouring county of Devon, an instance occurred in the same year of fatal results flowing from the depression of spirits consequent on witch-belief. A young married woman made acquaintance with 'a white witch' during a visit to Taunton. After her return home she told her husband and friends that she had been 'overlooked' by the witch; she became nervously depressed, and ended her brief career by drowning herself. We are not told whether any good result followed the exhortations of the coroner to the jury, to 'do their best to disabuse the minds of their neighbours of this ignorant superstition.'

On one particular Monday morning, in 1874, the pitmen at Bedworth Colliery, Warwickshire, obstinately refused to descend the pits; they roamed idly about Bedworth all day, losing a day's wages (and in all probability spending something additional for drink). The reason assigned was, that the 'Seven Whistlers' had been heard during the preceding night in the neighbourhood, and that this always presaged some colliery disaster. Whether these Whistlers were birds, ghosts, or devils, the pitmen did not know, nor could they be certain that the number was exactly seven; but they had heard the cries, and that was enough. In a recent article on 'Mysterious Sounds' we endeavoured to shew that the sounds produced by these 'Whistlers' proceeded from birds flying overhead during their migrations.

One more example, and our budget shall end. Its date is so recent as December 1875. One day, an aged woman at Long Compton, Warwickshire, was returning with bread from a baker's shop, when a man ran up to her, and wounded her so severely in the leg with a hay-fork that she died the next day. The man had for years entertained a belief that fifteen or sixteen witches in Long Compton, whose names he gave, had bewitched him, and interfered with his work. The superintendent of police told the coroner and jury that many of the villagers believed in witchcraft, and that the older women were those on whom the accusations of the bewitched mostly fell. The misuse or misinterpretation of the Bible is often noticeable in the conduct and half-crazy reasonings of these superstitious folks; the man pointed to three verses in Leviticus, and one in the Acts of the Apostles, to shew that he was justified in killing the poor old woman who had 'overlooked' him!

Baron Bramwell, who tried the prisoner in the case just adverted to, and who believed that superstition had driven the man half out of his wits, 'hoped that something would be done to disabuse the people of a belief in witchcraft.' Good; but we fear this improvement will be tardy unless the intelligent middle class can acquire more real influence with the humbler and ignorant class than they seem at present to possess.

The longer the publication of this article is deferred, the more numerous (apparently) would be the available examples of these mingled displays of credulity and rognery. While we are now writing (June 1876), the country newspapers tell us of a case which came before the magistracy.

A young woman complained that she was 'overlooked' by a witch; 'a cunning man' undertook, for a fee of three shillings, to write out a 'curse,' the uttering of which would kill the witch. The fee was paid; the curse was written and uttered; but the witch, somehow, refused to die; and so the silly girl made public the broken promise of the cunning man.

DASHMARTON'S LEGACY.

CHAPTER IV.

ALFRED HARVEY reached his father's house in the High Street of Meldenham town just in time for the two o'clock dinner. It was a quaint old-fashioned High Street, with gables and bow-windows and tall roofs and massive chimney-stalks arranged in picturesque confusion. But the house of Robert Harvey, ironmonger and dealer in agricultural implements, was a plain up-and-down construction of dull red brick, with two mean-looking shop-windows below, filled with articles of iron-ware, mostly swathed in their original brown-paper coverings. Times and seasons made little difference in the dull heavy appearance of Robert Harvey's shop. Certainly as haymaking-time came on, the doorway would bristle newly with a kind of *cherche de frise* of scythes with fierce shiny beaks protruding from their swaddling-papers, and great bundles of whetstones, calculated to make the sharp beaks sharper still. Summer, too, had its loads of reaping-hooks, about which knots of Irish harvest-men would gather critically. Then autumn with its hop-picking would bring forth its bundles of sharpened crowbars, known as 'pitchers,' its bill-hooks for cutting the bines; and its curious crooks—like the queer implements one sees in the Tower for rooting up the earth-bound poles, and locally known as hop-dogs. But even these changes brought no attractive features; and he must have been an inveterate idler, or a persevering searcher for knowledge under difficulties, who stopped to give a second glance at Harvey's shop-windows.

But you would do the man and his business a great injustice if you went away with the idea that they were dull and unimproving. Behind the stolid brickwork and the comfortable commonplace dwelling-house were spacious yards crammed with implements, from the lordly steam-plough to the humble chaff-cutter. Large salerooms too, bright with electro-plate, and stocked with everything that housekeepers could desire, from a two-pronged steel fork to a massive epergne that would grace an alderman's dinner-table. Indeed, Robert Harvey was an alderman himself, and could shew a good service of plate on occasion, and a good dinner to serve thereon. But he was not an ostentatious man, and loved the little darksome shop that had been the foundation of his fortunes, and did not disdain even now to don the black holland apron sometimes, and serve little urchins over the counter with hap'orths of tin tacks or pen'orths of gunpowder, as the case might be.

Robert Harvey was in his shop, as it happened, when his son drove up, and came out to the door with his hands beneath his apron, to greet him, and criticise his equipage in a sarcastic and yet prideful spirit. Alfred always drove a good horse, and his dogcart was of the slimmest and neatest description; and with bright brass harness, gaily

coloured rings, and glittering appointments, his animal made the old dingy shop look dingier still in contrast.

'Well, old man,' cried Alfred to his father, descending, and leaving the dogcart in charge of the toothless old porter, who grinned a delighted recognition of the young master—'well, old man, how are you? And how's mother?'

'Middlin', Alfred, middlin'. Better than she has been, but not so well as she might be. And how's yourself?'

'All right,' replied Alfred; 'but hungry—hungry as a hunter. Dinner ready soon, I hope?'

'Yes, I fancy there'll be a bit of beef and puddin' going on up-stairs presently,' said the old man, following his son through the shop into the house. 'Your mother'll be glad to see you, my boy, for she's been worrying a good deal about you.'

Mrs Harvey was a short puffy woman, who suffered a good deal from shortness of breath, spasms, and other uncomfortable ailments, and who bore upon her face something of the martyr air—suffering tempered with resignation. Anxious, too, was she always and troubled in her mind. Her ordinary temperament was not a joyous one; but in every depth she was skilled to find a lower still; and when she was confessedly 'low' in spirits, she developed and threw out an amount of gloom and depression that was sufficient to infect a whole parish with melancholy.

Dinner was just coming up, and with it an assemblage of young men from the shop and warehouses, so that Mrs Harvey could say nothing confidential to her son at that moment. She sighed over the potatoes and mourned over the Yorkshire pudding, shook her head dolorously over the decanter, and ate ostentatiously nothing. The young men and apprentices swallowed their dinners hastily and decamped one by one. When the last one had gone, Mrs Harvey burst into tears and rose to leave the room.

'Why, what's the matter, mother?' cried Alfred. 'Don't go on like that. Stop and have a glass of wine, and make yourself cheerful.'

'No, my dear boy, my dear deluded boy, there's no good cheer for me,' she sobbed, and left the room.

'Your mother's a good deal put out of the way, Alfred,' said Robert Harvey, briskly moving his chair round to the fire, and taking down a long clay-pipe and a black bottle from the cupboard—'a good deal worried from what you said the other day about that gal of yours. Come, draw up your chair, my boy; there's wine there, if you like it; for myself, I always stick to my gin-and-water, as you know.'

'What call has she got to worry herself about me?' said Alfred, lighting his briar-root pipe, and standing discontentedly by the high old-fashioned chimney-piece.

'Well, she do, Alfred; and it ain't unnatural, I must say. Me and your mother has worked hard all our lives to scrape and save and get a bit of property together, and we don't want to see it squandered. Now this gal of yours comes of a lot who've been spending their money all the time we've been saving; and she ain't a fit wife for you, let alone her not being of honest parentage, as one may say.'

'You've no right to say that, father,' retorted Alfred warmly. 'There wasn't a man more respected when he died than John Dashmarton;

and if he was behind-hand when everything came to be settled up, why, there's many a man as holds his head high enough in the world as would turn out the same. Besides, am I to turn my back on the girl I like, even if her father had proved over such a rogue?"

"Ah, but she was in it, Alfred, my boy; say what you like, she must have been in it, and known all about it."

"Father!" ejaculated Alfred, striking his fist against the mantel-shelf—"if you weren't my father, I should say you lie. There isn't an honest, truer girl in England than Lucy Dashmorton."

Robert Harvey smiled sardonically. "I happen to know a bit about the ins and outs of the business," he said. "And this is how I come to know it. The clerk that Dashmorton employed to help him with his books came to me the other day and asked for a job. 'Why, I thought you were with the Chilprunes, and looked for life,' I said, because I knew they took him on when John Dashmorton—well, when he died. 'Oh,' says the young fellow, 'they kept me on till I'd told 'em all I knew, and then gave me the sack.' So I gave him a job; and he's told me since a good deal about the matter. And I believe that gal was in with her father, and has fingered some of the money too."

"And what ground have you for saying so, father?" asked Alfred coolly, although his face had turned pale with passion.

"Well, this among others. Of course they couldn't trace all the money that Dashmorton embez—well, borrowed, if you like. But the very day before he died he drew a heavy cheque on the bank—six hundred pounds. That was when he knew the new auditor was coming down. Well, a hundred of it went in the town small bills, and so on; to give the man his due, he was punctual with his tradespeople; but the other five hundred he drew in one note; they got the number of it from the bank; and that note has not been presented yet at the Bank of England."

"There's nothing wonderful in that."

"Well, those big notes don't stop out long, as a general rule. Besides, if he'd made a payment of that sum, his books would shew it; for they say too that his books were well kept, and right to a farthing."

"Then what you want to make out is"—

"That the young folks have got a purse somewhere, and that the five hundred pound note's in it. They'll have to look sharp too, for the note's stopped.—Have you seen this in the paper, Alfred?"

The father pointed out in the newspaper the advertisement of the warning to bankers and others not to change the note. Alfred said nothing, but took out his penknife, and cut the slip out of the paper.

"It was a wonderful thing how John managed to go on so long," said Harvey senior, relighting his pipe, which during his long recital had gone out. "All the books were right, as I've said before, except one, and that was the pass-book, the banker's pass-book. John had two of them; one for the bank and one for the auditor. Well, old Partridge when he came down took the pass-book—that one shewn him—for gospel, sees the

balance so much, writes down his initials W. P. alongside it, and walks off to dinner with his friend John. Well, when the new man comes down, the first thing he does is to walk into the bank and ascertain the balance. John knew it was all up then."

"Ay, it was a bad business, a wretched bad business," groaned Alfred impatiently; "but all that has got nothing to do with my Lucy."

"But if it was proved against her, my boy, that she's sucked the money, what then? You wouldn't stick to her then?"

"No, I couldn't, then," said Alfred, with a sigh; "not if she were dishonest; but that's impossible. What's more to the purpose, father, is, she won't have me."

"Won't have you, boy?" said the father, half-pleased, half-vexed. "Come, that won't do, Alfred. She's hanging off a bit, to make you come on."

"I tell you I made her an offer this very morning, and she said No."

"Well, I'd never have thought that—never. You can't expect me to be sorry, Alfred; and still I don't like you being disappointed. But don't you be down-hearted; there's as good fish in the sea as ever were drawn out of it. A minx, a stuck-up minx! Then all the disgrace that's come upon her hasn't bowed her pride. Oh, it's shocking! Never you mind, Alfred; there's better things in store."

"That's all very well, father; but if you can't get the one thing you want, a hundred things you don't want are very little comfort to you."

Father and son smoked on for a while without speaking, Robert watching his son's face rather uneasily.

"I'm coming over to see you, Alfred, next week," he said, breaking the silence.

"Ah, what's that for?" asked Alfred.

"The sale, the sale of Mordieu."

"And what do you want there?"

"I'm going to buy it, that's all."

"You going to buy Mordieu, father?" exclaimed Alfred in surprise. "What do you want with Mordieu?"

"Perhaps to live there myself, perhaps to give it to you. Anyhow, I mean to have it."

"You will have to give a long price for it, father, that you certainly will!"

"D'ye think so?" asked Robert uneasily. "And why should I?"

"Because the Chilprune people mean to have it. It'll be put up at ten thousand; that's the mortgage; and the Chilprune estate will rise a thousand on that, and it isn't worth it. I wouldn't take that farm on a seven years' lease, and give three hundred a year for it. It might have been worth it once, but it isn't now. John took a rare lot out of it of late years."

"Then, I tell you, Alfred, that I'll give twelve for it, if it's necessary."

"Twelve thousand pounds! Why, you wouldn't get two and a half per cent. on your money."

"Ah! you young people don't know everything," said the sagacious parent, puffing sagely at his pipe. "I'll give twelve thousand rather than lose it, and I'll spring five hundred on that not to be beaten."

"Well, I think you're crazy, father."

"You do, do you? You'll be having me locked up in the 'sylum, next. The wise old man locked

up, and the mad young un running loose. Ha, ha ! Now, the fact is, he went on, suddenly becoming serious, 'if you'll promise me faithfully not to mention what I tell you, you shall know all about it. Honour bright !'

'Honour bright, father.'

'Well, you know, Alfred, I've done pretty well in London and Petersham shares. I'm a heavy holder, in fact. I bought fifty thousand stock ten years ago at twenty-five, and now they are a hundred and fourteen. What do you think of that, my son ?'

'Better than two and a half per cent., eh, father ?' said the young man, rubbing his hands. His father was generally scrupulously reticent on all financial matters, and although Alfred had a pretty good guess that he was well off, still this glimpse into the actual state of affairs was consoling and reassuring.

'Well, they wanted me to be a director not long ago ; but I'm not one to put myself forward, and I haven't had the edification quite to feel myself comfortable among all these great people. But, as Shakespeare says somewhere, I've done the company some good turns in my time, and they know it. Well, our chairman drove over the other day, and come and see me in my back-parlour. "Harvey," says he, "we're going to adopt your policy at last." "What's that, Sir Director ?" says I, forgetting for the moment what he was alluding to. "Why, the direct Meddenham line," says he. "Not a word about it," he says, "to any soul ; only you're one of the oldest and staunchest of our shareholders," he says, "and you are the only one out of the board of directors that has a hint about it." But that's what it will be in less than three years' time, a direct London and Meddenham line, and trains running the distance in an hour and twenty minutes.'

'And a jolly good thing for Meddenham.'

'Yes ; it will be a good thing for Friddenden—and it will be not a bad thing for Friddenden, Master Alfred. First-class station there—express brings you down in an hour from London. Eh ! what do you think of that ? 'The line has all been surveyed—that was done years ago for a bill that fell through—and it runs right along the edge of Mordieu, taking a nice little slice—at a nice little price—eh, & ye see ?'

'Ah, yes ; but they don't give the fancy prices they once did. It's something added to the value of the place, but not overmuch.'

'But what do you say, Alfred, to cutting up the estate into building lots ? Beautiful sites for villas. Bless you, I've had it in my head for ever so long, and I've planned it all out.'

'You aren't going in for building, father ?'

'Stick me in the 'sylum right out if I do, Alfred,' replied the father, laughing. 'No, no ; your father's not such a silly. Sell 'em the land, my boy, and make advances on the carcuses ; get other people to build 'em, and then walk in and take possession at half their cost—that's the game, my boy.'

'Oh, that's the way you rob your fellow-creatures, is it ? Well, thank God ! you made me a farmer, father.'

'It's all for you, Alfred—all for you,' said the old man, rubbing his hands. 'But don't you go squandering it away, and marrying gals as only know how to spend it.'

Alfred made no reply to this ; and his father soon gave signs of sinking into his customary after-dinner nap. This would last till four o'clock, when the old gentleman would wake up, and walk briskly down to the counting-house to look over the books and into his letters. Alfred yawned dolefully and went out, taking a walk down to the river, and watching the barges and river-craft. 'How nice it would be to have Lucy down here,' he thought to himself ; 'the time wouldn't hang heavy then. But I'm sure she'll never hit it with father and mother.'

The week following Alfred Harvey's departure passed on, as far as Lucy Dashmarton was concerned, in eventless but restless despondency. Every hour of the day and night had its pressure of wearing, ceaseless anxiety. She was obliged to work hard in her school, and that was her least unhappy time ; she could lose herself for a while in what she was about. But the old misery settled down upon her at every leisure moment.

Streeter, or the man who bore that name, had not made his appearance since, in Friddenden. Indeed, it was hardly likely that he would be again employed in a matter in which he had been so hoodwinked, especially as his person and mission were manifestly known to those over whom the watch was to be kept. But from some other quarter, no doubt, danger was imminent, and the longer delayed, the greater it seemed to be. If they searched her house at this moment, nothing would be found to compromise her ; but at any time Alfred might send back the book, and then the old difficulty would arise. True, she might destroy the note, which now seemed useless ; but that would be to cut off all hope for the future ; she could never do anything for Spiller then ; he would be lost altogether. She trembled to think of what might be his end if something were not done to extricate him from the mire. And then Lucy had knowledge enough of the matter to see that they could not effectually stop payment of the note. She could not pass it, nor any one connected with her, without great danger ; but in innocent hands, the Bank must pay it if it were presented. So that she had only to wait—to watch and wait.

Mrs Whitwick called once during the week, and brought Tresilian with her. But she was cold and strange in her manner, and asked Lucy all kinds of questions about her affairs and those of Spiller ; questions which Lucy resented, and would not answer. Tresilian was inclined to flutter round her like the moth about the candle ; but he had a firm Mentor at his elbow, and the next piece of news that Lucy heard was that he had gone off to his eligible curacy, to live in the vicarage, which was to be furnished for him in a sumptuous manner ; and that Mrs Whitwick was to spend half the year with him and half with her own husband. Tresilian did not venture to come and say good-bye ; but he sent her a copy of the book she had lost, with his best wishes and kindest remembrances.

Clearly, Tresilian had retired from the scene, and Lucy was now altogether deserted. It was better so—her disgrace would fall on herself alone—she would have no ties to wrench asunder, no friends to break with when the exposure came.

Meantime Alfred had staid out his week at Meddenham, heartily tired of the visit, and anxious to get back to his own place, where there was at least a chance of a daily sight of Lucy. But he had promised his parents a week, and he could not cut it short with any good grace. Besides, his father was coming back with him to stay a few days at the farm, and attend the sale of Mordien.

On the morning of departure, however, the old gentleman was suffering from a severe rheumatic attack that prevented his leaving his bed. He sent for his son, and after bewailing the hard fate that prevented his going to Friddenden to attend the sale, he confided to him the important trust of acting on his behalf and bidding for the property.

'Not more than twelve five, Alfred; and let's hope you'll get it for less. Don't seem anxious about it, but don't let it go. No, Alfred, not if you have to spring another five hundred or so. But nobody will be such a fool as to give as much as that, eh, Alfred?'

'Nobody but you, father, I should think,' said the son dutifully. 'There will be a thousand pounds or so wanted for the deposit, I expect, by the way, and I doubt if I have as much to my balance.'

'I'll draw you a cheque now, Alfred, and you can get the money here in Bank of England notes. There's no mistake about them, and they look respectable; but don't you go and make ducks and drakes with 'em, my boy.'

'Never fear, father,' said Alfred, smiling, and took his leave, calling at the bank on his way out of the town to cash the cheque. He took the money in hundred pound notes, crammed them into his greatcoat pocket hastily, and drove off, for the mare he drove was hot and fiery and would hardly stand a moment. It was a fourteen miles drive to Friddenden, through a pleasant diversified country, with arable and pasture, hop-lands and wood-lands succeeding and intermingling. The hop-gardens with their conical stacks of poles looked like the encampment of some great army. The copses, bare and silent, inclosed the fields in a misty purple setting, and the pale wintry sun gilded everything with a transitory glory, sparkling gaily on the frosted hedges, and setting the robins in the sheltered dells a-chiming out their flute-like winter notes. Altogether Alfred Harvey felt happy, and pleased with himself and all about him. He was going back home, and might happen to see Lucy on his way; he was not cast down at her rejection of him. He expected her to say 'No' some half-dozen times; but he was a persevering young man, and intended to win in the end.

Half-way to Friddenden there was an inn, where he stopped to give his horse some water and a mouthful of hay, and he took the opportunity of the stoppage to place his notes in a more secure receptacle. In feeling for his notes his hand came in contact with the book he had put there a week before. After he had disposed of his money in his breast-pocket, he pulled out the book to transfer it to the other side, and noticed that it was covered with glazed cloth.

'That's some of mother's nonsense,' he said; 'always covering up books, as if one was a school-boy with dirty fingers.' He tore the cover violently

off, and was about to fling it into the road, when some instinct of carefulness restrained him, and he contented himself with thrusting it into the vacant pocket. Then the title on the back caught his eye. '*The Education of the Future*,' he said to himself. 'How did I come by that! It was *On the Treatment of Clay-lands* when I put it in my pocket. Has it got my name inside it?' He looked to the fly-leaf, and saw 'Lucy Dashmarton' inscribed thereon.

'Bless her! I've taken her book away instead of my own,' he said, kissing the volume in an access of enthusiastic devotion. 'What a capital good job! It will be a famous excuse for me to call and see her, going home;' and he touched up the mare in higher spirits than ever.

ARTISTIC ERRORS AND ANACHRONISMS.

IN the works of some of the greatest painters, curious and startling anachronisms occur. In their representations we frequently find objects introduced long before the period of their existence; and to bring out an effect, historical truth has been in many cases ignored. In this respect, Raphael d'Urbino was a great transgressor: he introduces a hewn stone step into 'The Expulsion from Paradise;' and a book bound in the neatest possible modern manner into 'Elymas the Sorcerer struck Blind.' A host of other artists appear to have believed that the Virgin Mary was in the habit of studying a mass-book, and that the Hebrew kings wore robes similar to those of Henry VIII.

That there is nothing new under the sun, is a maxim the broad truth of which will be conceded by most men; but when Albert Dürer goes so far as to introduce a tent bedstead, a commodious cooking-range, and an array of china candlesticks, surmounted by modern-shaped candles, into his 'Birth of the Virgin,' the spectator is not unnaturally inclined to doubt whether the painter was altogether justified in his creations.

When buttons were invented is a problem that very probably cannot now be solved; but it is a question whether they were used in the days of Isaac. Silvio Mannig, however, evidently thought such to be the case; for in his picture of the sale of Joseph to the Ishmaelites, the coat of one of the brothers is not only fastened, but even decorated by their means. Lucas van Leyden, too, was bold enough to put a chignon on the head of Joel, the wife of Heber the Kenite; and not content with this, he surmounted the edifice with a beautiful coal-scuttle bonnet of straw. Salvator Rosa is another trespasser in the matter of head-dresses. An exquisite work by this master represents the Baptist preaching in the wilderness; but the whole effect is spoiled by the presence in the background of some jaunty spectators in slouch hats and flaunting feathers. Van Dyck himself represents one of the Apostles in sea-boots in his picture of 'The Miraculous Draught of Fishes,' which is now in the National Gallery; and Paul Veronese paints some Italian peasants in felt hats and plumes calmly contemplating the Adoration of the Magi. Agostino Carracci, in a picture of 'Tobias anointing his Father's Eyes,' puts the two men in shoes; and N. Poussin, in his celebrated 'Passage of the Red Sea,' introduces Roman armour of the time of the Emperors, regardless of the well-ascertained

fact, that the Egyptians about the days of the Hyksos did not indulge in metal armour at all. In one of Raphael's best works, the Transfiguration monopolises the upper part of the canvas, while in the lower portion the man possessed with an evil spirit is being simultaneously healed; and in a Flemish painting of some note, several corpulent boors, with clay-pipes in their mouths, are gazing in wonder at David, who is carrying the head of Goliath. Indeed, the history of the Poet King is made a frequent medium for anachronisms; for in another picture of the Death of Goliath, the giant wears no armour except a plumed helmet; and in a third, David is hurling at his adversary a rough stone instead of a pebble. At his subsequent triumph, according to yet another painting, David is received by Greek maidens in front of an Italian building surmounted by flags, while two pyramids in the background vainly do their best to lend harmony to the scene.

Abraham has been shamefully treated by his illustrators. A Spanish artist represents him as about to shoot Isaac with a pistol; and the patriarch is almost always represented as a man of not more than sixty years of age at most. A very common anachronism is the introduction of Italian architecture into Eastern scenes. Claude, for instance, in his 'Embarkation of the Queen of Sheba,' and Bono of Ferrara in his 'Jerome in the Desert,' do so; and examples might be multiplied *ad infinitum*. Claude, in the 'Embarkation of Saint Ursula,' also introduces ships of the type in use at the middle of the seventeenth century; and Boccaccio Boccaccino, in the 'Procession to Calvary,' fills up his background with a fine broad river covered with shipping, in spite of the well-known fact that nothing of the sort exists near Jerusalem. How the disciples, in Raphael's 'Miraculous Draught of Fishes,' managed to preserve their equilibrium in the very minute boats to which the artist has treated them, is a mystery; and why Claude should have celebrated the marriage of Isaac and Rebecca in front of a waterfall that might almost vie with that of Niagara, is a riddle that will probably never be solved.

The illustrations to Newton's Bible, which was published in 1771, contain some curious errors and anachronisms that are little known. Solomon is being anointed under the shadow of a pyramid; and the destruction of Dagon takes place in a building very similar in appearance to St Paul's Cathedral in London. David is singing before the Ark from a scroll that is conveniently held in front of him by a winged but legless cherub; and Sapphira dies in the street. In a picture representing the death of the lying prophet, the dead man wears a coat and trousers; and in another depicting Elijah and the priests of Baal, there is an altar, but no surrounding trench. Perhaps the most flagrant engraving in the collection is one of Daniel's Dream, which introduces four great beasts that do not in the least answer the description of them given in the text. Fortunately for the credit of the artists involved, all the pictures are anonymous; but some are known to have been executed by very eminent men.

A much cherished idea with the painters of the fifteenth and sixteenth centuries was that guitars and violins were in vogue at the time of our Saviour. Illustrations may be found in the works of Domenichino, Jean Belin, Cosimo Tura, and others,

but are far too numerous to be specified. Chello della Puera gives us a picture of a Madonna pouring some liquid from a richly chased vessel like a coffee-pot; Luigi Gigoli paints the aged Simeon at the Circumcision, in spectacles; and Brughel, in an 'Adoration of the Magi,' introduces an Ethiopian in a surplice, booted and spurred, who is presenting a model of a comparatively modern man-of-war to the infant Jesus. All these instances are so absurd and innocent that they require no comment; but one discovered in a Prayer-book published in the reign of William and Mary, is so very ludicrous, that it suggests a doubt as to whether it was not the work of a wag. The parable of the mote and the beam is the subject of the picture; and from the eye of one man a huge log of wood is protruding, while in that of the other is a very fine cascade. Probably the artist was afraid to risk his reputation upon still water, and therefore felt justified in turning the moat into a torrent in order to let people know what he meant. Another picture of about the same date represents a pair of copper scales falling from St Paul's eyes on his recovery from blindness; and it is not unlikely that the two curiosities owe their existence to the same inventive brain and cunning pencil.

In one of the churches at Bruges is a picture of the legendary marriage of Christ with Saint Catherine of Siena. Saint Dominic, in full canonicals, is performing the ceremony, and King David is complacently looking on and playing the harp. Carlo Maratti, in an 'Annunciation,' introduces a pair of scissors; and an unknown artist, representing the Impotent Man at the Pool of Bethesda, paints an angel with a very long pole vigorously stirring the waters of a very small pond until they are white with foam. Pietri di Cortone, in a painting which is now in Paris, depicts with great success the meeting and reconciliation of Jacob and Laban in the mountains of Mesopotamia; but the truth of the idea is rather hurt by the distant apparition of a church steeple. N. Ponsini's 'Deluge' with boats, and 'Saint Jerome' with an eight-day clock before him, are matters of history; and the picture of the boiled lobsters in the sea listening to Saint Anthony of Padua, is scarcely less celebrated. The catalogue of anachronisms in painting and drawing is, in fact, almost endless. Nearly every old book contains instances, and every picture-gallery is stocked with amusing specimens, provided the spectator will only take the trouble to look for them.

THE INDIAN CROW.

A STRANGER arriving in India is at once introduced to two of the greatest curiosities of the country. As his vessel slowly steams up the Hooghly, and almost before the Custom-house officer has come on board, her rigging has been invaded by at least one kite and two or more crows, all busily overhauling the deck, and scanning from aloft every nook and corner thereof with a keen eye to No. 1. Should any uncovered dish be incautiously conveyed from the galley to the saloon, its contents run a strong chance of being swooped off by a kite; and any droppings of food are as certainly pounced upon by a crow.

Leaving the vessel, the new arrival loses sight,

temporarily, of the kites; but on reaching his quarters, he is certain to re-encounter the crow, absolutely certain; wherever he subsequently travels, there he will find this amusing and omnipresent bird; and from the first, he cannot fail to notice, and be amused by, its audacious antics. On the morning after his arrival, let us imagine him seated in the veranda, discussing his first *chota hâ-ree* (literally, 'small breakfast,' a light and early meal universally taken in India). No sooner are the viands placed before him, than he will see two or three crows alighting on the veranda rails. Ignorant as yet of their tactics, he will quietly discuss his buttered toast, and perhaps introduce himself to the birds by throwing them little fragments thereof. Greedily devouring the inch, they quietly prepare to take the ell. Something calls him away for a moment, and he returns to find the thieves retreating with his toast or egg; and he sits down highly amused at their impudence.

Perhaps this scene occurs in his room, all the Venetian shutters of which are wide open. As he sits down to his meal, he will see a crow sitting on the top of the Venetian, and peering sideways and curiously into the room; and should he for a moment leave the table, he only returns to find his toast and the crow gone together.

Having thus generally introduced the Indian crow to our readers, let us proceed to describe his habits, character, and accomplishments.

Our friend rejoices in the learned name of *Corvus splendens*, and this designation has been evidently applied to him in derision, or perhaps on the *tuus a non tuendo* principle. The natives only know him as *kaw-wâ* (pronounced cow-wâ), and apparently name him from his caw. He is certainly in no way (except in genius) a *shining* bird, as will be admitted when I describe him. Take a rook, give him the curved beak of the raven, and the gray neck and eyes of the jackdaw, and you have a tolerable picture in size and colour of *Corvus splendens*, or, as he should be more appropriately called, *Corvus latro*. Our friend, though found throughout the Bengal Presidency—I may say throughout India, is not generally a gregarious bird, like the rook; you commonly meet him in families of from three to five individuals, and never, as a rule, at any distance from the haunts of men. I regret to be obliged to admit, that he prefers to live by plunder rather than by honest labour. Everything is fish that comes to the nets of those pillagers; they will plunder alike the stall of the *bunya* (dealer in grains and flour) or the butcher; they will gorge on sweetmeats or pilfer fruit; and eagerly will they tap the toddy pots hanging from the top of the palm; while with still greater gusto they will revel on the white ant when it swarms into the air as a perfect winged insect at the commencement of the rains. They will plunder the nosebags of horses, remain in close attendance on the kitchen, carry off young chickens from the fowl-yard, devour strawberries and tomatoes, await the daily shakings of the tablecloth, or carry off a greasy duster, and,

in short, be in constant readiness to carry off anything and everything.

They generally get the first pickings of carrion, and are always to be seen in the company of vultures when engaged in their sanatory operations. I have seen a crow deliberately sit on the back of a gorging vulture, and try to pull out of his beak a choice bit of carrion, the vulture being quite at the mercy of his agile tormentor. Frogs, the young of birds (except of their own kind, for 'there is honour among thieves'), mice, weak rats, and small and helpless creatures generally, especially the young of the squirrel, are eagerly carried off and devoured.

They are very fond of the cattle-tick, and in search of this pest you will see a crow deliberately climbing up a cow's tail, and carefully examining its root and neighbourhood for any hiding tick. Cattle generally value this partiality; and I have actually seen a cow lift its tail, as if to help the crow in its ascent. The neck and ears of oxen and buffaloes are also carefully examined for ticks.

Though possessed of such a bad character, the crow is universally tolerated as a comic pest, amusing alike to native and European.

A thief so accomplished must necessarily be wary and vigilant, and this quality is the only recommendation we can adduce on behalf of our friend. You may as reasonably hope to catch a weasel asleep, as to find a crow with his weather-eye closed; and this habitual wariness, even at night, often gives the alarm of danger. As the cackle of geese once saved the Roman Capitol from the thieving Gauls, so the cawing of crows has repeatedly given warning of the prowling thief or burglar. Crows will always announce the presence of, and try to mob any animal that goes abroad at unreasonable hours; thus they will mob the tiger or jackal, the owl or bat; and they invariably make an immense commotion on the appearance of a snake.

As a further illustration of the wariness of the crow, I may mention his thorough knowledge and immense fear of a gun. A crow will worry you in one of the many ways familiar to the tribe, and you will try to get rid of him by shouting and gesticulation. He will hop away a few paces, or fly a few yards, and then stop and look at you from both sides of his head. But point a gun at him, or even raise a stick to your shoulder, and he will at once fly in dismay, looking behind him all the time. This fear of a pointed stick seems to prevail with crows everywhere. But whence originated this mortal fear of a gun or stick? Believers in the theory would adduce it as an illustration of development, due, perhaps, to the presence of gun-using Europeans in the country; but then the crow at Dan dreads the gun or raised stick just as much as the crow at Beersheba, and it is quite possible that neither ever before saw a gun; and it is certain that there are thousands upon thousands of crows which have never seen, heard, or even dreamt of a gun, though equally certain that each one would exhibit the same dismay on seeing one.

As an offshoot of this wariness, let me notice the extraordinary confidence of the crow. I have frequently seen my little son run out to a collection of strange crows with some food in his hand; they would receive him in their midst, take the food scattered, and even try to rob him of it; but they would never allow me to be so familiar with

them, but would retire at once to a respectful distance. How was this? They confided in the young child, but dreaded the father, both absolute strangers to them. Reason was clearly here at work: they knew that the child was more artless than the man, and confided in him accordingly.

I have alluded to the teasing and worrying propensities of the crow; let me adduce some instances, which every Indian reader will endorse. During the hot weather, it is a common practice to sleep out of doors, and thus endeavour to secure the sleep denied in the stifling room. Towards the small-hours, the air generally cools a little, and sleep then steals over the tossing and weary frame, and daybreak finds you fast asleep: then it is that a crow will alight as near as possible, and awake you by his cawing; or if your bed is under a tree, he will rouse you by cawing, or by dropping twigs or other materials upon you. What is the use of shouting or throwing your slippers at him, in hopes of scaring him away? The mischief is done, and sleep has departed, and so has the crow, thoroughly satisfied with his cruel mischief.

A large astronomical telescope stood in the veranda of my study, in full view of my writing-table; now why should a particular crow delight in perching upon the tube of the instrument, cawing all the time, to distract me from my work? Why should he do this daily, and only cease when I rested an empty gun against the tripod? He had nothing to gain but the mere delight of teasing me. Perhaps a corvine apologist may say he was astronomically disposed, and wished me to tell him something about the starry wonders; but I scout this idea.

I have thus alluded at some length to the wariness and mischievous propensities of the crow; let me now adduce a good quality, notwithstanding his otherwise filthy habits and tastes. He is a very clean bird, and never goes without his daily bath, for which, if possible, he prefers running water. Crows are very fond of bathing in irrigation rills, and often vex the gardener by destroying them in the exuberance of their antics. They flock in crowds to a shallow river-side, and then afford a most lively spectacle. I have stated that crows are generally not gregarious, like the rook, and I will now illustrate the exceptions to the rule. In addition to their bathing assemblages, they have remarkable parliaments, which I have frequently watched in the distance with great amusement. These are always held in quiet out-of-the-way places, and *always on the ground*, and to them flock the brotherhood from all quarters. The proceedings are absolutely silent, and seem mainly to consist in small knots of individuals exhibiting their graces before one bird: they will hop round him in various attitudes, look at him first with one eye, then with the other; and all the while the central individual will be supremely indifferent to their attentions. Perhaps the proceedings will be varied by a disconcerted crow hopping to another group, there to exhibit his or her charms. This silent session will be maintained for an hour, and then suddenly break up with loud cawing; just as if the crows were being released from a disagreeable duty, and were rejoicing in their escape.

I never could make out what these assemblages are for: they are not amatory, for they occur as

often before as after the breeding season; and they are not judicial, for they are absolutely silent, and no results follow.

Crows are gregarious in the hour of danger: let one of their number be injured, and all the crows in the neighbourhood will flock to the spot, to help or sympathise, and evince their interest by loud caws. This peculiarity often gives occasion to a cruel joke at their expense; after some manœuvring, a crow will be shot, and instantly his brethren, now unmindful of the gun, will flock to the rescue, wheeling around with loud cries; and so solicitous are they, that two, and even three barrels may be discharged into their midst with fatal effect; and only then will they vociferously adjourn to the nearest tree, and thence pour out their torrents of corvine abuse. A milder joke consists in capturing a crow, and releasing him with a coloured rag tied to his leg. As usual, his brethren have assembled in angry numbers; but he is in no hurry to rejoin them; glad to escape at any price, he bolts away in the nearest direction, and perhaps one or two give chase, to ascertain all particulars; but there is no falling upon and snatching the liberated captive, who soon returns, rag and all, to his original haunts. The natives are very fond of running a feather through the nostrils of the crow, or stringing a cowry (a small shell, current as money) through them, and I have even once caught a crow on to whose neck a cervical vertebra of a camel had been forced. In each case the individual gets accustomed to the ornament, and his friends do not exclude him from their society. As regards the crow with the bony necktie, I had to break the ring with some force before I could liberate the animal; and then he departed rejoicing.

The crow is not gregarious in building; each pair builds apart, and pays but little attention to the structure or locality of the nest. Trees of all kinds are equally handy, and the proximity of dwellings is not objected to. Building operations are carried on soberly and noiselessly during the latter half of February and the whole of March, and the labours of incubation are mutually shared. I have ascertained as an undoubted fact, that crows, while incubating, leave their nests largely during the day; that is, they perch outside, keeping watch, but at night they sit closely. The same remark applies to sparrows, minas, and kites; and in corroboration of this, I will mention a singular fact. On one occasion I made a collection of eggs; and one day some crows' and minas' eggs were brought from a distance, and rather roughly, all huddled together in an earthen pot. They were placed in a drawer until I had leisure to blow them; but professional engagements caused me to overlook them. On the third day I heard mysterious sounds in the drawer, and on opening it found a young crow and mina chirping piteously. I tried hard to rear these strangely hatched birds, but both died. When the young—generally three or four—are hatched, the parents are indefatigable in their feeding attentions, and necessarily so, for more voracious nestlings can hardly be met with. Long after they have left the nest, you will meet a family, say on the high-road, the parents busily analysing any chance food, and the young birds clustering round them with flapping wings and gaping beaks, crying loudly for choice titbits, which are continually

being dropped into their mouths by their faithful parents. The enemy of crows during incubation is the koel, or Indian cuckoo, which chooses the nest of the crow for his nefarious purposes, as the European cuckoo generally does that of the hedge-sparrow. Consequently, the koel is invariably mobbed by crows whenever they come across it, although the imposed upon and bereaved parents nourish the changeling most affectionately. As the koel is smaller than the crow, its young one does not eject more than one or two young crows from the nest. It screams wildly while pursued by the crows, as if fully conscious of the punishment it deserves.

Crows are not at all amusing in captivity, and unlike their English congeners—the magpie, raven, and jackdaw—seem to lose all their cunning and knavery. I tamed one once; but the only faculty he exhibited was insatiable hunger combined with imbecility; the other crows seemed to despise him, although he flapped his wings imploringly to them; but they always helped themselves unresistingly to his food.

I let me now record some corvine anecdotes which came under my own observation. I was enjoying chota haizree with some friends on the *chubootra* (a masonry platform) just outside the veranda of their house, and a plated egg-stand was on the table. All this while, and unknown to us, a crow had been watching us from a closely adjoining tree; we had occasion to go indoors for a few moments, and on returning, found an egg and its cup missing. On inquiring, the *khudmatgar* (table attendant) said: 'Kāwa le giya'—A crow has taken it away. (Natives always ascribe breakages and pilferings to crows, as English servants do to cats.) Hardly crediting this, we were discussing the probability; when lo! the plated egg-cup came rattling down the tree; and the emptied egg-shell soon followed; and then friend crow slunk away abashed, as if detected. He enjoyed his egg all the same. On another occasion, an English dog of mine was enjoying a bone out in the open, and in close attendance were two crows, who made several futile attempts to pilfer the bone. At last, after a distinct consultation, one crow hopped off with dejected mien, and then, unconcernedly, approached the dog from behind. Suddenly he seized him by the tail; and the dog at once viciously snapped backwards, to avenge the insult. In a moment, the crow in front flew off with the bone, followed by its able ally; and so, like Mother Hubbard's disappointed pet, 'the poor dog had none.'

Here is an instance of how a crow was once outwitted. One day a young fish-alligator (gaviál), about four feet long, was brought to me; and I directed it to be placed in a small tank fairly stocked with fish. He evidently enjoyed himself; and in a month I was told that the tank was fishless. Shortly after, the hungry alligator was seen to seize and devour a puddly-bird (one of the egrets), which came to fish for frogs; and two days after, *mirabile dictu!* an unlucky crow which came to drink was seized and devoured. After this feat the alligator remained dinnerless for some days; but fortunately for it, the rains set in, the tank overflowed, and our saurian friend floated away to the Ganges.

I must conclude this account by describing the amusing pastime of crow-hawking with a bird

not much larger than the sparrow-hawk. As it is not allowed to kill, the crow is either captured or allowed to escape, none the worse for the encounter. On this occasion it was beautiful to observe the birds trying to outwit each other; the crow, never losing its presence of mind, dodged and counter-dodged the hawk, but without avail; and after an exciting aerial combat, it was borne to the ground, but only to renew the fight with 'beak and claw' until separated by an attendant. True to its salt, a brother crow came cawing on to the scene, to see what the hubbub was about (we were on a bare plain, miles away from the station), when it in turn was flown at by the hawk with the same amusing result.

Much more might be written about the Indian crow; but I think I have sufficiently shewn that it is one of the most amusing, most knowing, and most knavish birds in existence.

SONGS OF THE OLDEN TIME.

SALLY IN OUR ALLEY.

This popular English song was written by Henry Carey, about the middle of the eighteenth century. The air to which it was sung by INCELDON and other famed vocalists was that of a much older ballad, *The Country Lass*, now little known, but lately presented with some alterations in these pages. The following are select verses from the original song of *Sally in our Alley*, with a new concluding verse:

Of all the girls that are so smart,
There's none like pretty Sally;
She is the darling of my heart,
And lives in our alley.
There's ne'er a lady in the land
That's half so sweet as Sally;
She is the darling of my heart,
And lives in our alley.

Of all the days are in the week,
I dearly love but one day,
And that's the day that comes between
A Saturday and Monday;
For then I'm drest in all my best,
To walk abroad with Sally;
She is the darling of my heart,
And lives in our alley.

When Christmas comes about again,
Oh! then I shall have money;
I'll hoard it up, and box and all,
To give unto my honey;
I would it were ten thousand pounds,
I'd give it all to Sally;
She is the darling of my heart,
And lives in our alley.

And when my 'prenticeship is o'er,
I'll fondly marry Sally,
For then she's promised to be mine,
And with me quit the alley.
A joyous home of peace and love
Awaits my pretty Sally;
She is the darling of my heart,
And lives in our alley

NARRATIVE OF THE WRECK OF THE *STRATHMORE*.

BY ONE OF THE SURVIVORS.

THE *Strathmore* was an iron vessel of one thousand four hundred and ninety-two tons, and acknowledged to be as fine a ship of her class as ever left the port of London. Her commander, Captain Macdonald, besides being a worthy man, was an experienced and careful seaman. His first officer, Mr Ramsay, was also a sailor of the right type; but of the crew, generally, that could not be said, although there were some good men among them. We mustered a crew of thirty-eight, men and boys; passengers of the three classes, fifty-one; in all, eighty-nine souls. This was the clipper's first voyage, and our destination was Otago, New Zealand. The ship's cargo was principally railway iron; but along with other things we had candles and spirits, and a still more inflammable item, immediately to be mentioned. We left the docks on the 17th of April 1875, and dropped down the river below Gravesend to complete our cargo, by taking aboard twenty tons of gunpowder, which having been stored, all the arrangements for sailing were complete; and, heaving anchor, we bade farewell to England about midnight of the 19th of April.

We got very pleasantly out of the Channel, and, owing to the course we steered, we in a great measure avoided that handsman's terror, the swell of the Bay of Biscay. A head-wind now came on, which continued for a fortnight, driving us right across towards America. When that had ceased we had a fair wind, but so slight that at times we did not make more than a quarter of a mile an hour. After a time more fitting breezes blew; we had now somewhat settled down to life on board ship, the weather had become exceedingly hot, and we betook ourselves to such light amusements as suited the temperature; some to reading, some to whist and backgammon, others 'spinning' or listening to a yarn.

I and three friends occupied one cabin; Fred

Bentley, and two brothers, Percy and Spencer Joslen. Our meals were always welcome, agreeably breaking the monotony of life at sea. When we had been out about ten days the routine was rather unpleasantly varied by the discovery that the crew had broken into the cargo and abstracted a couple of cases of spirits. This might not have been so soon found out, had the knaves not got so helplessly drunk that they were incapable of work. For a day or two they were insubordinate, and the passengers had to assist in working the ship. This matter, however, blew over, and things fell into the ordinary course. So reckless were these men that they were seen (as we afterwards learned from a third-class passenger) in the vicinity of the gunpowder with a naked candle!

On the 20th of May we had a thunder-storm so terrific, that from its exciting effects some of the ladies were confined to their berths nearly all next day. To me and my companions it was a scene grander of the kind than we had ever witnessed in our northern latitudes. No ordinary language could describe it.

On the following day, May 21st, we were hailed by the *Loch Maree*, homeward bound, and short of provisions; latitude 4° 20' north. Our captain having supplied this ship with such stores as he could spare, we sent letters home by her. We were spoken by the *Borealis* on the 27th of May, and for the last time by the *Melpomene* on the 8th of June. We had this vessel in sight for two days.

Passing over the amusements incidental to crossing the line, nothing of importance occurred while proceeding in a south-easterly direction, till we had rounded the Cape of Good Hope, and got fairly into the Southern Ocean. This vast expanse of sea, between latitude 40 degrees and 50 degrees, is dotted with several groups of small desolate islands, requiring to be shunned with all the care of the navigator. At mid-day of the 30th June we were eighty-seven miles from one of these dangerous groups, called the Crozet Islands; and running at the rate of six knots an hour, we expected them

to be in sight by next morning, the 1st of July. A good look-out was kept. But two circumstances baffled every precaution. There was an error in the compass,* and a fog settled down on the horizon; the result being that the captain believed we were ten or fifteen miles farther south than we really were. Hence the dreadful fatality that ensued. At a quarter before four in the morning of the 1st July, when in my berth, I felt the ship strike on one of these wretched Crozet Islands. I hurriedly dressed, and my friend Bentley went to warn the ladies, whom he already found up and hastily attired. The ship had got wedged in a cleft in the rock. This, our partial escape from destruction, appeared to us little short of a miracle, for had she struck a few feet on either side, our ship, good though she was, must inevitably at once have gone down. She hung by the fore-part, with a list to starboard, her stern being submerged in deep water.

Bentley and I with others made for the port-quarter boat, but we could not get it off the davits, as a sea broke over us and washed us forward to the hand-rail of the poop. All from the poop forward was now rapidly getting under water to midship. The captain, seemingly greatly distressed, yet with characteristic disregard of self, gave orders as to the boats, directing that the women should be looked to first; his chief officer, Mr Ramsay, another fine fellow, also doing all that was possible in the short time left to them. Unhappily for them and for us, the second or third wave that washed over the ship carried away these good men, all of whom were respected and lamented. A number of the people got into the port lifeboat, including Mrs Wordsworth (the only lady saved), and Messrs Bentley and Spencer Joslen. A sea came and took this boat off the chocks. She fell back and partly stove in her bottom, but rose and floated across the poop, and finally left the ship, to the wonder of every one, without capsizing. It was in endeavouring to leap into this boat that our poor friend Percy Joslen was lost. The gig, with others of the crew and passengers, followed in charge of the second mate; and after her the dinghy in charge of the third mate, about nine o'clock A.M.

To resume my personal experience. The boats left us going towards the rocks, which we saw in front of us about one hundred yards off, rising like a wall several hundreds of feet out of the water. I should have mentioned that, for the time, having parted company with Bentley, I, to save myself, took to the mizzen rigging. There I remained with others until daybreak, by which time the ship had gone under water, all but the fore-castle head. On day breaking, I got along the mizzen top-gallant stay to the main-mast; and from there, down the main-stay, to the roof of the deckhouse. There was a heavy swell, but every wave did not break over us. Several others scrambled to the same place. We then went on to the fore-castle.

Late in the afternoon the gig returned and took away five passengers whom we had not before seen, and who had been clinging to the mizzen-top.

* The error may have arisen from the proximity of the ship to the Crozets, whose rock-bound coast abounds in compass-detracting ironstone. Or, the compasses of the ship—which perhaps was not properly ‘swung’ before leaving port—may have been affected by her cargo of iron.

They went off, and we were left shivering in the cold, the lateness of the day rendering it impossible for the boat to return. We passed a miserable night. Our position was one of great peril, as we felt the vessel rising and falling with the flowing and receding wave; we not knowing but that the next wave would liberate and sink our ill-fated ship—as was the case a few hours after we left her. We had nothing to subsist on but a few biscuits, and were almost frozen by the wet and extreme cold. About ten A.M. of the second day, the gig returned, bringing back the hope of life which had almost left us. This boat took us all off, the last remaining being myself, another passenger, and nine of the crew. The sea had now become more calm, and we got to the landing-place, about a mile and a half to the south-east of where our ship had struck; this place had been discovered by the first boat; and a rope had been fixed to the cliff, by which we climbed up the rock.

As the morning of the wreck was nearly pitch dark and the incidents were too crowded, many occurred which did not come under my personal observation. Miss Henderson was swept from the deck by an early wave; her brother survived, to die a more lingering death on the island. Mrs Walker fell a victim to her maternal feelings, as she would not enter the boat without her child. It had been taken by the second mate, and placed in charge of the second steward in the rigging. One of the ship's apprentices, much to his credit, gave up, on request, a life-buoy to one of the passengers. Terrible as the circumstances of this sad morning were, it is surprising the outward composure that was maintained throughout. I did not hear even one scream from the women. Mrs Wordsworth shewed great self-possession. When all landed and collected, we found forty lives had been lost, including one entire family of ten. George Mellor, a third-class passenger, died a-hore of exhaustion the second night, and was buried in the sea.

Upon landing, I was regaled with a leg of a young albatross (of which and other birds there was fortunately a considerable store on the island) roasted; and after having been thirty hours on the wreck, I need scarcely say that I never tasted anything sweeter. A glance at the sterile rock on which the fates had driven us, and on which we were to live if we could for an indefinite time, shewed that, compared with it, Crusoe's island was as the garden of Eden. We were on Apostle Island, which, to judge by the guano-deposit, must have been the home of sea-birds for ages, and on which, very probably, the foot of man had but seldom if ever trod.

Before entering on the subject of our life on the island, it may be as well to give a brief account of the group of islands of which ours was one. The Crozet Islands are a volcanic group to the south of the Indian Ocean, lying between Kerguelen's land on the east and Prince Edward's Islands on the west. They take their name from Crozet, a French naval officer. Apostle Island, on which we were, was the largest of the reef of rocks called the Twelve Apostles, forming part of the group. Large and small, islands and rocks inclusive, are twenty-six in number.

We spent the first and second nights ashore very miserably, owing to the cold and damp. My first night—the second since the wreck—I, along with five others, lay under a rock; next night we all

got into a shanty which had been built, but we were so closely packed that it was not possible to sleep. Therefore next night, Bentley, Henderson, and I went back to the rock, under the ledge of which we slept for several weeks. Before we got more sheltered, by building up a wall of turf, we were sometimes, in the morning when we awoke, covered with two or three inches of snow. Little of any value was saved from the wreck; some clothes were got out of the fore-cabin; and a passenger's chest, containing sheetings, blankets, table-covers, knives, forks, spoons, and a few other things, was picked up on return to the ship by the life-boat. The boats picked up, floating, a cask of port-wine, two cases of gin, two cases of rum, one of brandy, one of pickles, some fire-wood, and a case of ladies' boots, which were not of much use to us; also a case of confectionery, the tins of which became very serviceable as pots for culinary purposes.

Two barrels of gunpowder also were found, and matches; also some deck-planks and other pieces of timber were secured, which were useful for our fires. When the wood was exhausted, we discovered that the skins of the birds made excellent fuel. During the night of the 31 July, the boats moored to the rocks broke away and were lost. This was greatly deplored at the time; but I consider it a fortunate circumstance, for, the ship having sunk, the only storage that would have been recoverable was spirits, which perhaps we were better without. And for another reason: with the boats we might have been tempted to visit, and perhaps remain on Hog Island, which appeared about six miles off. We should have had a greater variety of food there, and probably altogether less privations and discomfort than we were subjected to on Apostle Island; but we would have been more out of the course of ships going to Australia or New Zealand, so that our rescue might have been much longer delayed.

The want of controlling authority was soon apparent in our small community. There was no one capable of exercising that influence, which by judgment, firmness, and a sense of justice, supported by the well-disposed, would have kept in check the troublesome spirits, who, however, were a small minority. Disciplinary power being wanting, the turbulent element was on the ascendant for some weeks after our landing. At length matters subsided into comparative order; but there never was perfect confidence. It was found advisable, for the general advantage, that we should be separated into parties; subsequently, into as many as six squads. This segregation was effected by a kind of natural affinity in the combining elements.

Mrs Wordsworth lived for a considerable time in the large shanty, until a smaller one was given up for the sole use of her and her son. This lady was ill during nearly the whole time of our sojourn on the island, but bore the privations she was subjected to with great fortitude. Little could be done to alleviate the hardships she suffered; she received such attention as the limited means at hand afforded; and was throughout treated with general respect. For instance, when dinner was served, each man passed his hat for his share of fowl; Mrs Wordsworth's was handed to her on a piece of board.

A Bible had been saved, which was read aloud, and psalms sung from time to time with great

fervency; and early teachings, which had lain long latent, were revived with great force in their application to our present condition. These readings had a peculiar solemnity when we were laying our dead in their graves. The emotions thus produced were with some probably transient, although at the time heartfelt; with others the impressions may be more lasting.

We found our island to be about a mile and a half long by half a mile in breadth; no wood grew on it, indeed a considerable part of it was bare rock; the rest of it was covered with rank grass, and an edible root with a top like a carrot, but not in any other respect resembling that useful esculent. We found this of great service to us, as it was our only vegetable, and grew plentifully; we ate the stalk at first, and afterwards the tops only; sometimes boiled, sometimes raw. It has been said that he was a brave man who first ate an egg; if that be admitted, I think some claim to courage may be made by our quartermaster 'Bill,' who, notwithstanding some warning jokes, first tested this plant, very much to our future benefit.

We were also fortunate in discovering an excellent spring of water, somewhat impregnated with iron, but imparting a quality which I believe was very favourable to our health. In our frequent and very necessary ablutions we used, in lieu of soap, the yolks of eggs and birds' livers; some made use of their blood for the same purpose, which I did not much incline to. When we landed on the island there were about two hundred of the albatross young and old, and notwithstanding the warning of the Ancient Mariner, we killed many of these fine and, to us, useful birds. We agreed, however, not to meddle with the eggs, that we might in due time have the benefit of the young birds. There were several hundreds of 'gray-backs' (Knot), a very few small white pigeons, sea and land ducks, and lots of 'whalers' (Ivory gull) and divers—birds about twice the size of a sparrow. These make their nests in the ground, about a foot or two deep. Mutton-birds were found for many months; they also make nests underground, but are rather more particular in selecting dry spots. They are about the size of a small hen, black feathered, and coated with fat, which, even raw, we considered a luxury. The molly-hawks (Fulmar petrel) came in about the middle of August: there were several hundreds of them. As soon as one lot was killed others came in; in all, there must have been five thousand, if not more. The first penguin was killed by the cook, I think on the 29th of September; only a few were seen within the next three days, but every day after that they came in hundreds. There must have been from time to time fully a million of these birds. We killed upwards of fifty thousand without making any apparent impression on their numbers. The albatross, which had left, returned to the island before we were taken off. This fine bird, that 'holds its holiday in the stormy gale,' I had heard say was fourteen feet in the expanse of its wings; but we had specimens on our rock that were seventeen feet from the extreme points of their extended pinions. Captain Carmichael (*Linn. Trans.* vol. xii.) says that the great albatross raises no nest, but merely selects some cavity for the reception of a single white egg; whereas those on our island raised a very fine high nest. It

nourishes its young by disgorging the oily contents of its stomach. The cock-bird comes to land first, as it were to select the spot for the hen-bird to deposit the egg; which, when laid by the hen, he sits on for days, while the lady-bird goes to sea.

The penguin, which feeds its young in the same way as the albatross, is a curious bird, having, in place of wings, two membranes which hang down at each side like little arms. It cannot fly. Its mode of walking is very singular, something between a waddle and a hop. As our rock was precipitous on all sides, the penguins came in where the rock was lowest, riding on the crest of the beating wave, often failing in their first attempts to land. When they touch the ground they march landward in Indian file, keeping good order; but are received as intruders by those already on shore. In fact their reception is most inhospitable; they are pecked at, and made to understand that they are not wanted; however, there is no blood shed, and they soon unite with the original settlers, in turn joining them in the assault on the next comers, or invaders, as they seem to think. They sit for about two months apparently without eating, and then return to the sea greatly emaciated. The penguin makes no preparation for the egg, dropping it anywhere. Their patient endurance is remarkable. They often sit on the egg until their tails, covered with icicles, are frozen to the ground. This strange bird appears idle in keeping with the remote and lonely islands in which it congregates and has congregated for untold generations. The molly-hawks too, fine large birds, rendered us good service as food.

The killing of the birds was at first very repugnant to us. The albatross was easily de-peached; but the penguin was more tenacious of life, and though a harmless bird if left unmolested, at times shewed fight. The tedium of our life was mitigated by the necessity we were under in hunting these birds for our daily food; and the eggs which lay in hundreds around us were a very acceptable and nutritious article of diet, and contributed greatly to keeping up our strength.

We had recourse to many odd devices for table articles, such as gin and other bottles for drinking-cups, as long as they remained unbroken; then bladders, and penguin skins made into bags, into which we dipped a long hollow bone and imbibed the water, sherry-cobbler fashion. When we melted the fat of the birds it was poured into one of my sea-boots to cool, after which we put it into the skin-bags to keep. My other boot was used to hold salt water. Bentley's boots were taken to the spring for fresh water, and were the best pitchers we had. When we had to resort to the feathers for fuel, the fool took a long time to prepare, and one meal was scarcely finished ere cooking was begun for the next. Each man was cook for a week at a time. In our shanty we cut off the foot of a sea-boot and used it as a drinking-cup. Bentley was very handy; he made needles out of wire, part of the rigging. As for thread, we drew it from a strong counterpane, and when that failed, we used dried grass. A knife was made from hoop-iron from a gin-case, one side of the handle from the top of a powder-keg, the other side from the blade of an axe, riveted with wire from the rigging, the washers being

made from a brass plate from the heel of my boot; also handles for a watch were fashioned from a plate likewise taken from my boot—all the work of Bentley. Our present abode was as truly the Rock of Storms, and as deserving of that title as ever the Cape was. The island was ever more or less tempest-beaten. Our hardships from cold, rain, and snow were very severe; in fact, we were never warm, and hardly ever dry.

As time passed on from days to weeks, and from weeks to months, without succour, we thought somewhat sadly of the anxiety of our friends at home; yet in our shanty at least, we never despaired of being ultimately rescued. We kept up our spirits as well as we could, holding our Saturday evening concerts—the song with the loudest chorus being the greatest favourite. We had among us a cynic, whom we knew to be engaged, and who prophesied that all our sweethearts would be married by the time we got home! We had sighted four ships, two of them coming near; one so near that we saw the man at the wheel. The captain of this ship made no sign of seeing us, but we afterwards learned that he *did* see us, but did not even report that he had, when he got into port. This behaviour on the part of one of our own countrymen contrasts painfully with the generous conduct of the gallant Americans who subsequently rescued us.

It would be bootless to narrate how from day to day we kept anxious watch; the record would be little more than a monotonous detail of disappointment, cheerless days, stormy weather, and bitterly cold nights. Our day on the look out, which we took in turns, was a most wearisome duty. We had lost other four of our companions—five in all since we came ashore. Mr Standbury, a young man from Dover, died on the 19th of July of lockjaw. Mr Henderson, who had been our companion on board ship and in our shelter under the rock, and who had become endeared to us by his good disposition, died of dysentery, after a long illness, on the 24 of September. We rendered him what assistance we could, but that was little. On the 23d of November, William Husband, an elderly seaman, died. On Christmas day, Mr Walker's child died. This was the last death on the island. It is curious that all the bodies after death were quite limp. I do not know whether this can be accounted for by the diet or some peculiar atmospheric condition. I have heard that death caused by lightning is followed by the same result. Another curious observation I made was that, if we cut ourselves, however slightly, the bleeding did not altogether cease for a couple of days. The antiseptic effect of the guano was shewn somewhat curiously. It was rumoured that one of the dead had been buried with a comb in his pocket; and one of our party wishing to obtain it, two months after the interment, found the body with no sign of decay.

January 1876 had now come. In view of the future, we had collected and stored over a hundred gallons of bird-oil for the use of our lamps, which we kept burning all night, the wicks made from threads drawn from sheets and other articles. We had also gathered many thousand penguin-skins for fuel. We had now to some extent become acclimatised, and were in better health than we were last year. We were put to great shifts for cooking utensils, our kitchen-ware being nearly

worn out, though we found some hollow stones, which we used as frying and stew pans. We had, soon after landing, erected flag-staffs, on which we placed a counterpane or blanket to attract the attention of ships that might come near us.

Early in January we resolved to build, on an eminence, a high square tower of turf, for the double purpose of drawing the notice of passing ships and serving as a shelter for the man on the look-out. The digging of the turf was a great difficulty, our only implements being our hands and a piece or two of hoop-iron. We were greatly retarded in our building by the unfavourable weather, the rain coming down heavily. A vessel passed us on the 14th of this month, but no notice was taken of our signals.

January the 21st was an eventful day: deliverance was at hand! About six o'clock in the afternoon we were all startled by a cry from the man on the look-out: 'Sail, ho!' We did not long delay in rushing up towards the flag-staff; we hoisted two flags, consisting of a piece of canvas and a blanket, one on the flag-staff and one on the unfinished tower; we kindled two fires, the smoke of which we calculated would be seen a good way off. The vessel did not at first seem to regard our signals; we were probably too impatient. She, however, soon made head towards us, when we became greatly excited; some, in their delight, cutting strange antics, in fact a genuine 'break-down.' When about a mile from our rock, to our great joy, she lowered two boats. They tried to effect a landing on the north side, but it was not possible. One of the boats coming nearer the rock, our sail-maker leaped into the water, and was hauled aboard. They then pulled to the point where we originally landed. Captain Giffard was in one of the boats. Night coming on, he told us that he could not take us off until next morning, but that he should leave us some bread and pork. However, upon being told that there was a lady ashore, he gallantly brought his boat as close to the rock as he prudently could, and took aboard Mrs Wordsworth, her son, two invalids, and the second mate. We spent this our last night on the island with little sleep, but with tumultuous feelings of joy and hope—for we were yet to see the friends who had long mourned us as dead.

Next morning, the vessel coming nearer, three boats came ashore for us. The carpenter having made four crosses of wood, they were placed to mark the graves of our unfortunate companions whose fate it was to rest in this lonely isle in the Indian Ocean, which we left with beating hearts and no regrets, and where we had spent six months and twenty-two days under very unusual conditions. I believe that the most thoughtless among us will remember with sobered feelings, and to his latest day, his sojourn on Apostle Island.

We were received on board the ship with the greatest kindness, being all provided with complete suits of new clothing, taken from the ship's stores. Mrs Wordsworth received every attention from Mrs Giffard, the captain's wife. The ship which relieved us was the *Young Phoenix* of New Bedford, an American whaler, commanded by Captain Giffard. Of this kind-hearted and generous sailor it is impossible for us to speak in terms too laudatory: we would be ungrateful indeed if we did

not keep him in lasting remembrance. I would fain hope that means will be found to reimburse him for the large pecuniary loss that, otherwise, his profusely unselfish generosity must involve.

On the 26th January we sighted the *Sierra Morena* of Liverpool, Captain Kennedy, bound to Kurrachee. As we overcrowded the *Young Phoenix*, Captain Kennedy willingly agreed to take twenty of us to Point de Galle, Ceylon; where, after an agreeable passage, he landed us on the 24th of February. Our thanks are due to Captain Kennedy for the treatment we received on board his ship.

Our rescue had been quickly made known in England: on the 29th of February I received a telegram from home. I should have observed that Captain Giffard, for the time giving up the object of his cruise, steered for the Mauritius; but on the afternoon of the day we left, falling in with the *Childers*, bound for Rangoon, the remainder of our companions were transferred to that vessel, and subsequently shipped for home. We spent some time most agreeably at Point de Galle, receiving great kindness from the district judge, the ship's agent, the Church of England minister, the collector of customs, and other gentlemen. We were, in fact, treated more like friends than castaways, and are not likely ever to forget the attention we received.

I am again in England, and at home, endeavouring to look back upon the wreck of the *Strathmore* merely as an unpleasant dream. G. B. C.

FALLEN FORTUNES.

CHAPTER XXXVII.—JENNY AT BAY.

MR CAMPDEN was upon the whole not sorry to have been left behind by his wife in Sanbeck; the short way to Riverside over the crags was not, indeed, very nice walking in winter weather; but it was no great distance to Bleabarrow, where 'the fly' could be procured to take him home; and he was really glad of being alone with Jeff, and of having a word or two in private with the two girls. Jeff had received no summons to Riverside upon this melancholy occasion—Mrs Campden objected, as a matter of principle, to people running into expenses for mere sentiment—but had invited himself to Dr Carzon's.

'I should like, if it would not be inconvenient to you,' he wrote the doctor, 'to pay the last tribute of respect to the best and dearest friend I have had in the world;' and the doctor had allowed the plea, and welcomed the lad warmly.

He looked something more than a lad now; his life in town had given him an air of independence and self-possession, though without the least touch of conceit. He looked handsomer than ever, though his dark eyes were heavy with woe, and his fair face shadowed with grief, as he walked with little Tony ahead of their two companions, and talked in a low voice of the departed dear one.

With the squire and the doctor, as was natural, the future of the orphaned Daltons formed the chief topic of conversation; and in connection with it, Mr Campden mentioned the offer that had been made by Mr Holt.

'It was a deuced kind thing of the man, that I must say,' observed he, when he had delivered this information, which he felt somehow had fallen flat.

'Very much so,' said the doctor, 'if it was disinterested.'

'There was no promise attached to it whatsoever, my good friend; the offer was made quite free.'

'Still, from what I have seen of Mr Holt,' persisted the other, 'I should think he was a gentleman who looked, in some shape or another, for his *quid pro quo*. Moreover, I believe him clever enough to gauge the nature of those with whom he has to deal. If he lends our young friends money, he places them under an obligation; and there is only one way—as it seems to me by which that obligation can be discharged.'

'I think you are not very charitable to Mr Holt,' said Mr Campden, with a little flush.

'Perhaps not,' said the doctor dryly. 'Still, I think it hard upon the girl to place her in such a position. Suppose a lovely young woman, for example (and what can be more likely?), advanced me money upon very doubtful security—should not I be bound, if I could not repay her, to make her Mrs C.?'

'I believe you're right, Curzon,' said Mr Campden suddenly: 'it has struck me in the same light, myself. The money, if they want it, shall be forthcoming some other way.'

He gave a great sigh as he said that, as a thrifty man might do who has made up his mind to some extravagance; but Mr Campden was not thrifty; and though he was counting the cost of what he had resolved to do, it was not the expense that made him sigh. If he advised the girls not to take this money, especially if his wife had already persuaded them to do so, 'there would be the deuce of a row,' he knew, with Julia.

'I say, Jeff, what is *your* opinion of Mr Holt?' inquired the doctor presently, pitching his voice so as to reach the others; 'that is, so far as you can tell it consistently with loyalty to your chief.'

'Ay, we mustn't disclose the secrets of the prison-house, must we?' said Mr Campden; 'how we rig the markets, and all that.'

'I am bound to say that Mr Holt has been uniformly civil to me,' replied the young fellow frankly. 'Nay, not only civil, but considerate. In my ignorance and inexperience, I have no doubt made lots of blunders in business matters, and he has never said a word about them. And this is the more creditable to him, because he hates me very cordially, and he knows that I hate him.'

'My dear Jeff, I am astonished at you!' exclaimed Mr Campden. The doctor looked astonished too, but with a sly twinkle in his eyes that did not speak reproach.

'No, sir; we don't like one another, and we never shall,' continued the young man; 'but I do my duty by him, I hope, and, as I say, I have nothing to complain of in his behaviour to me.'

'Well, I have known many partnerships carried on on worse terms,' observed the doctor cheerfully. 'But how was it that oil and vinegar were got to mix in the first instance?'

'The explanation is very simple, doctor. Mrs Dalton—God bless her!—asked Mr Holt to take me, and advised me to go. And—and—here Jeff began for the first time to exhibit embarrassment—'nothing else happened to offer itself.'

For the second time the colour came into Mr Campden's face; he could not but remember the circumstances under which Jeff had been driven

from Riverside. It was quite a relief to him that a bend of the road here shewed them the village—they were now returning from the mere—and once more introduced, by association, the topic of the morning.

'I should like to have a few words with your sisters before I start, Tony,' said the squire, 'if they feel equal to see me.'

'Oh, I am sure they would see *you*, Uncle George, because'—Here he stopped short; what he had in his mind was, 'because they could see Mrs Campden, who is not half so nice,' but unlike that lady, he sometimes felt a hesitation in speaking his mind.

'Because he is their best friend; eh, Tony?' observed the doctor, hastening to the rescue. 'That is quite right. We three will take another turn together, while the squire goes in.'

Since Mrs Campden's departure that afternoon, the two sisters had not met. Kitty had devoted herself to the baby, and Jenny had remained in her own room endeavouring, in vain, to devote herself to her books. They were both aware that it behoved them to be doing *something*: not to give themselves over to the grief that was importuning them to become its prey. They only shewed their weakness by avoiding the little drawing-room when they conveniently could; since it was there that the sense of loss oppressed them most: the unfinished piece of work; the still open desk; the book half read; the empty lounging-chair, were for the present daggers, each of which stabbed them to the very heart. Perhaps, too, the consciousness of their disagreement—or rather of their want of accord with respect to the proposition made by Mrs Campden, had helped to keep them apart for that half-hour or so. A quarrel was impossible between them at any time, much more on the very day when they had laid in earth the being they had loved best upon it, and who had repaid their love with such usurious interest. There were reasons, as I have shewn, why these two from the first should not have gone the way of most sisters in this respect; and since misfortune had befallen them, the bonds of love between them had been naturally strengthened and tightened. It is a poor fancy indeed that has painted Love as flying out of the window when Poverty knocks at the door. With those within, if they be not utterly worthless, he remains a more cherished guest than ever. Indeed, it was only their ordinary close affection and unanimity which gave any importance to the difference of opinion between the two sisters; it seemed so strange to each that the other should take an opposite view of any matter.

Jenny on her part had no doubt whatever as to the course they were bound to follow with respect to Mr Holt's offer. If she had thought Kitty was seriously thinking of accepting it, she would have been furious. She saw it at once in the very light in which it appeared to Dr Curzon. 'This impudent man was offering to lend his money upon the very best of security—namely, on Kitty herself. If the offer was accepted, it was in fact the offer of his hand!' What hesitation therefore need there be as to their reply? As to Mrs Campden's making the proposition, that was only to be expected, after what had already happened, and was another reason, if such were wanted, for declining it. Sooner than see her Kitty sacrificed on the altar

to Mammon, for the sake of herself and Tony and the baby, she would have 'starved first.'

But besides this bitter feeling, there was a fire kindled in Jenny's breast that flamed against almost everybody; nay, which resented the blows of Fate itself. She had taken it ill in church that day that the Bleabarrow clergyman—of whose cure Sanbeck formed a portion not much visited except in the summer months—should have spoken of her mother's future with charitable confidence. The words of Hamlet addressed to the officiating minister at Ophelia's grave would have expressed her thoughts. What priest on earth had the right to eulogise her mother, far less to hint a doubt of her perfection? As for the outside world, she scorned it: the chill touch of misfortune had withered up her soul, and shut her sympathies within very narrow limits. Her own flesh and blood: Jeff and the doctor: Nurse Haywood and Uncle George, were now all the world held that was dear to her; and even Uncle George was suffering in her opinion as the husband—or rather because he was the slave—of his Julia. Under these circumstances, it was perhaps creditable to poor Jenny that she had been as civil to Mrs Campden that afternoon as she had been.

Kitty, on the other hand, was actuated by different feelings. Her mother's death had left her—until her father's return, of which, however, she at least still entertained a hope—head of the family, and her soul was filled with the sense of that responsibility. The proposition made on behalf of Mr Holt did not strike her with that force and significance which it had for her sister; she saw in it a kindness, unexpected indeed, but explicable enough on the ground of his friendship for her father. She looked upon the money as a loan, not as a gift; and though even so, it would be unpleasant to accept it, she did not think it consistent with her duty to those left in her charge to refuse such an offer point-blank. She had not yet made herself aware how their slender finances actually stood, and therefore could not measure the necessity of the case; and she was solicitous not to lose a friend for her dear ones, and still more, not to make an enemy. That she could be resolute against dictation, when her heart counselled resistance, has been proved by her refusal of Mrs Campden's generous proposal to take the baby off her hands; but Jenny had left the room before she had displayed this fortitude.

It was therefore under some sort of misunderstanding, rather than disagreement, that the two sisters now met in the little sitting-room, having been summoned thither by the squire's arrival.

'My darlings,' said he gently, 'this is a sad day for you; but I thought you would not mind seeing Uncle George.'

The sight of these delicate girls, so pale and mournful, in their simple black dresses, affected him deeply. He noticed that Kitty wept, while Jenny was quite dry-eyed, and yet that the latter looked the more pained and hopeless of the two; that was probably, thought he, because of her physical ailment, poor thing. He tenderly embraced them both, and then spoke some hopeful words about their father.

'Jeff says that it is by no means thought to be a desperate case with regard to the *Flamborough Head*, even now; and that persons are still found to insure her, though, of course, at a great pre-

mium— Come, come, girls; cheer up: I hope and trust that my old friend may come home to see his darlings yet.'

'Not all his darlings—not the best of them,' moaned Kitty, wringing her little hands.

'I have no hope, Uncle George,' said Jenny quietly.

'Well, well; time will shew, lass. My prayer is, that your poor father may be restored to be your guide and protector. But if it please God to deny this, material matters will, on the other hand, be less untoward with you. His life is insured—though, singularly enough, I never knew it—in a Company of which I am a director, for five thousand pounds. The worst is, that some time may elapse before the proof arrives—that is'—

'We understand,' interrupted Jenny quietly. 'Mrs Campden explained it.'

'Yes, yes; and about Holt's offer, and so on. Well, I have been thinking since, that you might have some hesitation in accepting that. Now, suppose a little arrangement should be entered into between you two and me, no one else knowing anything about it; there would not be the same objection, would there? Here are two hundred pounds—that would be enough, eh?'

'O yes, Uncle George; but'—

'Now, my dear Kitty, it's a loan; you need have no false pride in the matter.'

'But I am not sure that we shall want it, Uncle George, at least not just at present. We shall live very, very quietly now—shall we not, Jenny, you and I? and as for Tony, he will soon be off our hands. It is such an indescribable pleasure to us to think that the poor boy will for the next year or two, at all events, feel no disadvantage from his change of fortune, since you have so kindly offered to send him to Eton.'

'To Eton?' said Mr Campden, reddening. 'Yes; to be sure there was some talk of that. But Mrs Campden was thinking perhaps some other school—I mean in the boy's own interest—might, under the circumstances, be more suitable.'

'O dear; I am so sorry!' said Kitty. 'Papa went away so pleased that Tony was to go to Eton; and mamma—I think, somehow, dear mamma had set her heart upon it. Moreover, Uncle George, you promised it,' observed Kitty gravely.

'Well, my dear, I believe I did, and I should like to do it still; but the fact is, Mrs Campden thinks— However, no matter about that; I promise you the boy shall go to as good a school as Eton.'

'Subject to what Mrs Campden thinks.'

'O Jenny, Jenny!' cried Kitty reprovingly.

Mr Campden's face turned from red to white. It was the first time either of the girls had seen Uncle George 'put out,' except by his wife.

'You should not speak to your father's friend like that, Jenny,' said he severely. 'It is not becoming in a young girl.'

'It is becoming in no one to break his word, and least of all because'—

'Be quiet, Jenny!' cried her sister, with passionate pleading. 'How can you, can you talk so, when Uncle George has just been so kind!'

'What Jenny says will make no difference as to that,' said the squire coldly. 'The two hundred pounds are quite at your service.'

'But I am not sure that we shall want them,

Uncle George,' said Kitty timidly, and flushing very much at the sight of Mr Campden's pocket-book. It held the very same notes which had been offered to John Dalton on the eve of his luckless departure from Riverside, and been declined.

'You will certainly want them, my dear,' said he; 'if not to-day, to-morrow. It is ridiculous to suppose that you can keep house—and pay unlooked-for expenses also—on your little income, without any hope of its being increased.'

'We have hope, Mr Campden,' said Jenny slowly. 'And I for my part at least, had rather not take.'—

'You talk very foolishly, girl,' interrupted Mr Campden with irritation: 'if you suppose you can earn your own living, you must be mad. I know you are thinking of your lacework; but Lady Skipton was writing about it only the other day to Mrs Campden, and assured her that, commercially speaking, it was valueless.'

It was a cruel thing to say, even in anger, but the squire little knew what pain he was inflicting. The thought that her little private note to Lady Skipton with its offer of the lace had been made the subject of correspondence between her ladyship and Mrs Campden, was gall and wormwood to her. 'That woman' must have known, then, that she had tried to sell her wares in town, and failed.

'It is not the lace at all, Mr Campden, which I have in my mind,' said Jenny, speaking very firmly.

'What is it, then?'

'It is a secret. I cannot tell you what it is, even if you promised not to tell.'

'Jenny, you are insulting me.'

'No; I am but telling the truth; though, if I did insult you, it would be only what your wife did to us to-day, and has been doing every day since we were poor.'

'This is very sad,' said Mr Campden, looking at Kitty.

'Yes, it is,' continued Jenny passionately; 'it is very sad to think that one's friends should be so base. I say these things because I am angry; but Kitty thinks the same, though she does not say them.'

'There is some frightful mistake,' murmured Mr Campden helplessly. The alteration in his wife's manner towards her late guests since their misfortune had by no means escaped him; but he had flattered himself that he alone had seen it.

'A mistake!' cried Jenny scornfully. 'Yes, it is a mistake, and very frightful too, to insult people because they are poor; to patronise them; to endeavour to humiliate them by gifts at the expense of others. That, however, is what one must needs expect of some natures women's natures. But that a man—a man—should promise something to an old friend, and then, when that friend has been lost at sea, and his wife is dead, and his children desolate, should break his word, at the instigation of another—that, I say, is base!'

In her indignation and bitterness, Jenny had risen to her feet. If she had been a strong big woman, red of face and loud of tongue, one might have set her down as a virago; but being pale and wan, and speaking most musically all the while, although her words flowed like a torrent, it was impossible for a man to despise her wrath.

'I cannot stay here to listen to these things,' said Mr Campden, also rising from his seat. 'I came here, Heaven knows, without expecting any such scene—I wished to do you nothing but kindness, and I wish it still, Kitty.'

'I know it, Uncle George, and Jenny knows it,' sobbed poor Kitty; 'only, she was put out by the disappointment about Eton: not on her own account, of course, nor even on Tony's, but because it was mamma's wish that—that—and because to-day of all days.'—

'Yes, yes; I see,' said Mr Campden, his kindly nature reasserting itself; 'it has been very unfortunate. But don't let us part ill friends.'

Kitty's answer was to throw her arms about his neck and cover him with tears and kisses.

'Come, Jenny,' said he, 'you will shake hands with Uncle George?'

'O yes; I will shake hands with you—Mr Campden; and I thank you for all your kindnesses in old times.'

'Well, the old times will come again, my girl, some day; and you will be sorry to have been so bitter with us at Riverside, and I should be sorry too—only I shall have forgotten it.'

'No, Mr Campden; you will not have forgotten it, though it is kind of you to say you will; and the old times will *never* come back; they are dead and gone.' The tears came into her large eyes, her voice trembled, her frail limbs gave way beneath her, and she would have fallen, but for Kitty's protecting arm, which in a moment encircled her waist.

'Don't speak, darling; don't worry yourself,' whispered Kitty; 'Uncle George has not gone away angry: there is no mischief done—at least I hope not. And I don't blame you for what you said—no, not one bit.'

Whosoever had deserted them, whomsoever they had lost, these two loving hearts were one, and the stronger for their intertwining.

PRIMITIVE MODES OF CROSSING THE CASHMERE RIVERS.

WHEN Sir Douglas Forsyth and Colonel Gordon, in 1873, went on an Embassy from the Viceroy of India to the Khan of Kashgar and Yarkand, they had to cross some of the most tremendous mountain-passes in Asia, separating the Punjab and Cashmere on the south from Tibet and Kashgar on the north. The mountains form the rugged knot which connects the Himalaya with the Hindu Kush ranges, and are intersected with ravines and river torrents difficult to cross with the rude appliances of those regions—especially for a train of several score men and mules, with baggage of all kinds. The historian of the Embassy, Mr Bellow (army surgeon in the Bengal cavalry), in his recently published volume, gives an interesting account of the contrivances adopted by the natives for crossing rivers where no bridges exist.

The Jhelum, forming at one part the boundary between the Punjab and Cashmere, is, at the point where many travellers cross it, so beset with rapids and huge boulders as to be neither fordable on foot nor passable by boats. The natives use a rope-bridge called a *nára*, a single cord stretched across from bank to bank, and secured to the top of vertical walls of cliff. The cord is furnished with a loop-cradle slung on it by a forked piece of wood,

in such a way that the cradle, though irremovable, is free to slide backwards and forwards on the line. Mr Bellew watched the movements of a spare half-naked mountaineer in crossing this frail bridge. The man fastened a scanty bundle around his chest with a tattered scarf, and cautiously stepped down to the edge of the rock; pulling the cradle towards him, he seated himself in the loop (for the cradle was really nothing more). With a thrust against the rock, he pushed himself, and shot half across the river by the descending inclination of the rope itself. Arrived there, however, the momentum ceased, and he was brought to a stand. Resting for a moment in mid-air over the roaring and foaming torrent, to still the oscillations of the rope, he seized the cord with both hands, and propelled himself forward by a series of sudden jerks of the legs, grasping the cord a foot or two in advance, and timing the movements of the jerks to the oscillations of the cord. In this way he reached the top edge of the cliff on the opposite side of the river. The cord was nothing but a close, thick, and strong twist, made of a long climbing-plant mixed with the twigs of a species of *Indigofera*; the cradle and shore fastenings were of raw hide. When kept in good repair, these slender bridges, it appears, are very strong, and capable of conveying horses and sheep across the river; the animals are slung in the cradle, and let gently down one slope and hauled up the other by means of a separate rope. Such bridges, however, are only used where the banks are very steep, and the stretch across not very wide.

The members of the Embassy saw the river crossed by some natives at Thandali in quite a different manner. The bank on one shore is only a little way above the level of the river, while on the other it rises almost perpendicularly from the water's edge; there are therefore no facilities for the *mané*, just described. The crossing was effected by means of a *shinúz*, at a time when the river was in full flood, and quantities of drift were being carried along the rushing torrent. The *shinúz* is little more than an inflated ox or goat hide—or rather, two hides lashed together; each separately inflated by blowing through a wooden vent fixed in one of the fore-legs of the hide, and closed by a wooden plug. The floating craft thus formed was held on the edge of the river till the rider, striding across it, passed each leg through a loop of strapping hanging like a stirrup-leather on each side; then, keeping his two hands on the two vent-plugs (partly to keep them firm, and partly as a hold), he plunged out into the foaming torrent, paddling along with legs and elbows. Much skill is required to manage these bladder-boats (if such they may be called) in rough water; but the natives who cross the rivers of the Upper Punjab and Cashmere are equal to the occasion. 'We saw,' says Mr Bellew, 'several men out on the *shinúz* in quest of the drift borne down by the flood; and to judge from the ease and confidence with which each guided his awkward little craft, they must be practically familiar with its use in this place. The courage with which they buffeted the breakers, and the dexterity shewn in avoiding the whirl of the rapids, were no less astonishing than the skill with which they secured a passing waif, and the firmness of riding displayed as their buoyant supports were borne bounding over the wave-tops. On this occa-

sion, we saw the river crossed under exceptionally difficult conditions. In the ordinary state of the current the passage is a simpler matter; it admits of a bundle being carried on the back of the passenger, who, if he cannot paddle himself over, may be towed across by another who can.'

Another mode of crossing rivers is by the *jhála*, a sort of swing-bridge. Mr Bellew saw this in use at a part of the Jhelum near Hattyaer, where the river is a hundred yards or so in width, and flanked by high banks. The *jhála* consists of three ropes stretched across the stream at a height of eight or ten feet above the water; they are fastened to two buttress piers, built up of loose boulders and brushwood *lagots*. Each pier slopes as a kind of causeway towards the land, but drops as a wall towards the water; whilst in its substance are imbedded several strong upright posts as supports for the three ropes. These ropes are stretched across the river in a mode represented in section by the three points of a letter V, or by the three dots '·' that is, two upper ropes side by side, and the other midway between them, but at a lower level. Numerous large V-shaped prongs of wood, placed at intervals of four or five yards apart, keep the ropes in their proper relative positions; these prongs are secured by thongs of raw hide, and are further strengthened above by a cord which is passed across from one upper point of the prong to the other.

Such being the construction of the *jhála*, Mr Bellew saw one of them used as a bridge in the following manner. The ropes hung with a considerable bend by their own weight; whilst the wind swayed them in a somewhat violent manner. A native crossed the river by *walking along the lowest rope*, and maintained his balance with his two hands on the upper ropes, which came about to the level of his shoulders. It was not a performance *à la Blondin*, for the man had the hand-ropes to guide him; nevertheless, it required a nimble use of supple feet to tread in safety such a narrow pathway. Mr Bellew saw four men cross this bridge at the same time, two of them carrying bundles at their backs; they followed one another at intervals of four or five paces, and were careful to 'break step' (as soldiers call it), so as to prevent the dangerous undulations which would otherwise have jerked them off their narrow footing. As they arrived at the prongs in succession, they cautiously ducked or stooped under the cross cords. Only one man at a time was in the space between two adjacent prongs—doubtless to avert over-pressure on so frail a bridge. The weight of the four men, distributed over different parts of the length, was sufficient to bear down the middle of the bridge to the surface of the water, inasmuch that the men's feet were temporarily immersed in wave-crests, and the structure swayed considerably from the action of the men upon it and the waves beneath it. But the natives plodded on without timidity, custom and practice having habituated them to this singular mode of crossing rivers.

One kind of bridge, called a *kaddal*, crossing a river near the chief city of Cashmere, appears to have made more pretension to engineering rank; nevertheless it would be a very primitive affair in our eyes. It is formed entirely of undressed logs of pine and cedar—whole tree trunks simply lopped of their branches. The longest and strongest are laid side by side across the river, resting on rude

piers. These piers, of which there are six, are twenty to twenty-five feet apart; and a length of two or three feet of each end of every log rests simply on them, without any other fastening. The piers are solid blocks or masses of logs, arranged layer above layer alternately at right angles, and every log resting in notches cut in those below; they are somewhat of hour-glass contour, the horizontal section about half-way up being less than at the top or the bottom. The piers repose on a foundation of stones imbedded in the muddy bed of the river, and are protected against the current by a cut-water pointing upstream, and built of loose stones filled into a frame of logs. Upright posts of cedar timber are driven into every pier, and these posts support two hand-railings that run from end to end of the bridge. The cedar timber is very durable, and the rickety-looking fabric is really strong and lasting.

DASHMARTON'S LEGACY.

CHAPTER V.

ALFRED HARVEY reached Fridlenden soon after three o'clock, and in an ordinary way would have driven through the town without stopping, and so home. But on this occasion he had made up his mind to see Lucy; he therefore put up his horse at the *White Hart*, and walked down the High Street towards the cottage. On his way he met Spiller. 'Shall I find your sister at home?' he asked.

'No,' said the youth; 'it's holiday afternoon, and she's gone out somewhere; but she'll be home by tea-time. Suppose you come in and share our humble meal—afternoon tea, eh?'

Spiller was thus gracious because he saw in Alfred Harvey the sole chance of any extrication from his embarrassments. If Harvey were engaged to his sister, he would be bound to do something for him, Spiller. It would be a nuisance to be connected with such a loutish fellow; but that could not be helped. There was no doubt that he had plenty of money even now, and would be a rich man when his father died. Tresilian was out of the race now, evidently, Spiller thought, and Alfred was the disagreeable alternative.

Alfred did not, however, eagerly snatch at the opportunity, as one might have expected; for one thing, he was uncertain as to what sort of a reception he would get from Lucy if he appeared under Spiller's auspices. He replied, therefore, guardedly, that he thought he could not stay in town so long, but that if he could manage it he might come. He had an opportunity now to deliver the book, but he did not avail himself of it. No; he would not rashly part with this invaluable passport. If he could only find out now where Lucy had gone, and throw himself in her way as she returned, he would have a chance of a delightful walk; and then, if she confirmed her brother's invitation, an equally agreeable evening might follow. He could not very well make inquiries, however, as to Lucy's whereabouts; he must trust to his own judgment and good-luck for hitting the right direction. It was most likely that she had gone as far as Tattenden—that was her favourite walk, and Alfred knew and respected the motive that took her there. But by strolling along gently

in that direction, he would probably meet her about half-way.

The young man had calculated pretty correctly; before he had traversed half the distance between Fridlenden and Tattenden, she whom he sought appeared in the distance coming towards him. The sight of her figure robed in black, her slow, listless step and despondent attitude, struck him with compassion. How different she had seemed a few short months ago, with her gay humours and imperious ways, her coquetish costumes, her style and independence! She saw him now, and would have turned aside if she could; but there was no other way open to her, and she must meet him perforce. She quickened her step, and assumed a bearing more erect and defiant: her face was a little flushed, but that might be owing to the fatigue of the walk.

'It is a happy accident this,' said Harvey, raising his hat as they met; 'I wanted to see you so much.'

'You have returned from your father's, then?' asked Lucy, in an indifferent tone of voice. 'How did you leave them at home?'

'Oh, all right,' replied Alfred, ungratefully forgetful of his father's indisposition. 'Father was coming back with me, only he was too ill.'

'A moment ago you said he was all right.'

'Yes; I forgot. Father is very ill.'

'I am very sorry,' said Lucy. 'What is the matter with him?'

'Something rheumatic, I fancy,' replied Alfred. 'Oh, he'll get over it all right—he has these attacks constantly.'

'That does not make them the less dangerous. Has he proper advice?'

'He does not want advice, bless you; the old man doctors himself beautifully. Makes it awkward though, this time, because he was coming to the sale to-morrow.'

'What sale?' asked Lucy. 'O yes; I remember now,' she added with a sigh.

'But I'm to act for him. I say, Lucy, it's on the cards that you might be mistress of Mordieu again, if you like.'

'That is very improbable.'

'I said if you liked, you know. No; you needn't turn away, Lucy. I'm not going to harp any more on that string—not just yet. Do you know I've been thinking very seriously over what you said the other day, and I've come to the conclusion that I was a great bear on that occasion. You offered me friendship—the affection of a sister. Well, I was for flinging them away. I've thought better of it since. Let me be your friend—your brother.'

'I am glad you have come to your senses,' replied Lucy.

'And then, you know,' went on Alfred, 'I can come and see you as often as I like.'

Lucy shook her head vehemently. 'No; that would not be a friendly part,' she said; 'not at all. True friendship would be to leave me to myself—never to come near me—not to talk of me, think of me even.'

'That's impossible.'

'But you must make it possible. Don't you see that it is cruel in you in my position to persecute me? Don't you see that your visits are remarked, that even now, the gossips of the town will say that I came here to meet you?'

'I'll go home the other way, if you like,' said Alfred, stopping short.

'No; that would make it worse. Don't think that I care about idle chatter; but with me, it may take away my daily bread.'

'And why won't you let me make you independent of all these chattering, Lucy? You've only a word to say.'

'There, again; you see you are not to be trusted,' sighed Lucy sadly.

'I won't say another word,' cried Alfred; and indeed, he walked on doggedly a long way in silence, till they came in sight of Friddenden church tower.

'Spiller—I met him just now in the town—said something about coming to have a cup of tea; but I wouldn't say "Yes" without knowing whether you'd like it,' remarked Harvey humbly.

'Don't, this afternoon,' said Lucy; 'I have such a dreadful headache.'

Not another word was spoken till they reached the door of the cottage, when, as Alfred held out his hand in farewell, Lucy turned suddenly upon him; the question had been on her lips during all their walk.

'Have you taken away a book of mine?' she asked.

'Yes, I have; it's in my greatcoat pocket, and that's in the dogcart. I'll go and fetch it directly. Or shall I bring it to-morrow?—I shall be passing this way.'

'Yes; bring it to-morrow—to-morrow,' responded Lucy faintly; and Alfred saw that she turned quite pale, and leaned against the railings of the garden gate for support. Next moment, however, she had disappeared into the house.

Harvey had not gone far before he met Mr Elkins and Lord Tancanville coming down the High Street, followed at a little distance by a young man in plain clothes, but rather of the policeman type. Perhaps it was the sight of Mr Elkins that had discomposed Lucy, and no wonder!

'Ah, this is Mr Harvey,' explained Mr Elkins to his lordship; 'one of our best tenants.'

Tancanville waved his hand affably. 'Glad to see you, Mr Harvey.'

'And by the way,' went on Elkins, 'he is the very man who is likely to do our business in a better way than we can ourselves.—Mr Harvey,' he said, addressing Alfred, 'can you spare us a few minutes?'

Harvey replied that he could; and the whole party returned to the *White Hart*, where they entered a private sitting-room. 'Wait outside, Streeter; if we want you, we will call you in,' said Elkins, as they entered. Streeter touched his hat and remained by the door.

'We understand, Harvey,' said Elkins affably, 'that you are the principal friend and adviser of these unfortunate young people, the Dashmartons.'

'I am quite ready to act in that capacity,' said Alfred; 'but I hold no appointment of the kind from them.'

'Precisely so; you will act in that capacity. That is all we want. This is an irregular unofficial line of proceeding altogether; but it is Lord Tancanville's wish,' intimated Elkins, turning in his lordship's direction.

'Yes, my wish decidedly, Elkins,' returned Lord Tancanville, drawing forth a tortoiseshell

snuff-box and helping himself copiously. 'Quite my wish. Go on, Elkins.'

'Well, the statement I have to make is a very painful one, but our duty to the estate leaves me no option but to make it. We have reason to believe that concealment has been practised by somebody—that Dashmarton was at the time of his death in possession of a considerable sum of money which has somehow disappeared. Now, we neither promise nor threaten; we accuse no one, we exonerate no one; but we desire, before taking the ultimate proceedings that may seem advisable, that these young people—you understand—should receive a gentle warning and a caution—at least that is Lord Tancanville's wish.'

'Decidedly my wish, Elkins,' said Lord Tancanville, taking another pinch.

'Now, is it not better that this inquiry should be made in a friendly way through you, than by some inferior agent; the young man outside, for instance, who is, I don't disguise the fact, the agent of a private inquiry office?'

'The question itself is somewhat of an insult,' said Harvey. 'As far as the young lady is concerned, I would venture all I possess upon her honesty. Everything was given up without demur.'

'Yes; everything that it was impossible to conceal. But as I said before, we accuse no one. We only want to have the question asked: "Do you or do you not know of the existence of any sum of money formerly in the custody of John Dashmarton, and received from him directly or indirectly?" Now, is it better that this question should be asked through a friend like yourself, or through an agent like the man outside?'

'You put me in a very awkward position,' said Alfred. 'But, sooner than the Dashmartons should be exposed to the visit of this detective, I will undertake the mission.'

'You understand,' said Elkins; 'first the question, then the warning. If the money exists and is not given up, then the law will be put in force. We have good information, and shall strike quickly and firmly.—I believe I have expressed Lord Tancanville's wishes in this matter?' went on Elkins, bowing once more towards his lordship.

'Yes; my wishes decidedly, Elkins: you have put them exceedingly well.'

'Then in half an hour, Mr Harvey, we may expect to have some definite reply. If all knowledge is denied, a simple "No" will be sufficient. If otherwise, it will be necessary to go into details.'

'I could write the "No" in advance,' said Harvey; 'but, as I have undertaken the matter, I will go through with it.'

This conversation had almost driven out of his head the book that he had left in his greatcoat pocket; but he recalled the matter before he left the inn-yard, and took the volume with him under his arm.

Emily opened the door of the cottage, in answer to his knock, and shewed him into the little parlour. 'She'll be down in a minute,' said the little maid, in a confidential tone.

There was nothing in the appearance of this humble sitting-room to justify the surmise that any large portion of misappropriated money had been sunk in its adornment. Half-a-dozen cane-chairs; a piece of neat drugging on the floor; a square table of stained deal, with a cloth cover; a

few common vases on the mantel-shelf; a distorting mirror over the fireplace: these did not look like the rewards of successful fraud—of the plunder of other people's money-bags.

Lucy entered with an air of surprise at seeing Alfred thus returned. 'You have not taken all this trouble about my book?' she said.

'No,' replied Alfred, with a kind of forced laugh. 'I have just met a little company of lunatics, who have commissioned me to ask you a question, which I should have declined altogether to do, had I not hoped to save you from annoyance.'

'You are very kind. Pray, what is the nature of the question?'

'Well, these people, who are acting for the trustees of the Chilpinne estate, have got it into their ridiculous heads that—in fact, that there was money left at your father's death which belonged to the estate, and that some one has taken it and concealed it. Now this, of course, is all nonsense. You know nothing about it?'

'No; I know nothing about it,' repeated Lucy mechanically.

'Of course not. I knew that it was all a parcel of idiotic rubbish,' said Alfred triumphantly. 'Miss Dashmarton, pardon me for having asked you such an insulting question.'

'If I had taken the money it would have been'—Here Lucy paused.

'Yes, it would have been a downright robbery. Fancy you a robber, Lucy! I should mistrust my own mother next.'

'But if one had done such a thing,' asked Lucy, 'what would they do to one?'

'Oh, I suppose it would be an affair for the assizes,' returned Alfred carelessly.

At this moment Spiller came in: he looked keenly from one to the other. 'What! you've come to spend the evening, Harvey, eh?'

'No,' interrupted Lucy. 'Mr Harvey has come to inquire about the secret hoard, Spiller.'

'Ah, the purse,' cried Spiller; 'I wish I could find it out.—Don't you, Lucy?'

'By the way, here is your book, Lucy,' said Alfred, rising to take his departure.

'Ah, yes, the book!' cried Lucy, looking at it in dismay. 'But the cover—what have you done with the cover?'

'Let me see. What did I do with the cover? Chuckled it into the road, I fancy. Thinks I, when I saw it on my book, as I thought: This is some of mother's handiwork; and I was for pitching it into the road. No; but I didn't throw it away, Lucy,' he added hastily, seeing an unaccountable look of distress upon her face. 'I've left it in my greatcoat pocket, and I mean to keep it. I shall put it on my own book, and I shall always think of you when I take it up.'

Miss Dashmarton followed Harvey to the door. 'Will these people, do you think, take any other measures? What will they do next?'

'O yes; I forgot,' replied Alfred cheerfully. 'They have got a detective down here. But don't fear, Lucy; he can't hurt honest people; and if he gives you any annoyance, send for me.'

'Perhaps they will watch the house?'

'I shouldn't wonder. It will be fun if they do.'

'Yes, it will be great fun,' repeated Lucy, with a quaver in her voice.

'I should like to see 'em come to my house,' said Alfred, 'with a search-warrant perhaps. Being your nearest friend, Lucy, why shouldn't they? Wouldn't I have a nice game with them?'

'Alfred, send me that cover back now at once. Promise me,' entreated Lucy.

'Indeed,' replied her lover banteringly, 'I shall promise nothing of the kind;' and with these words he took his departure.

(To be continued.)

GAMES ON HORSEBACK: POLO AND TENT-PEGGING.

THE thought might possibly occur to some of us that horse-soldiers, subject to a considerable amount of muscular exercise in the course of their professional duties, would be loath to engage in sports of an equestrian character involving a still greater demand for bodily activity. And this is perhaps the case among the rank and file of cavalry regiments, who groom their own horses, and have much drill and exercise to get through every day; whereas the officers have their horses groomed for them. Be this as it may, some equestrian games find much favour with officers of cavalry regiments.

One such game is Polo, sometimes familiarly known as *Hockey on Horseback*. It is a newcomer in England, but has been long known in Asia, where wide-spreading plains offer ample space for the galloping and rushing about of horsemen. It is admitted in India to be good drilling as well as an exciting amusement; for it gradually gives dexterity in the use of any weapon held in the hand; it requires the player to keep a firm seat in his saddle; and it teaches him the art of turning quickly and striking to the right hand or the left. True, the weapon is only a kind of hockey-stick, instead of being a lance or a sword; still its use accustoms him to a rapidity and pliability of movement likely to be useful in the *mêlée* of battle. British cavalry officers first took up the game a few years ago in the Punjab, when stationed at Lahore; and it was so well liked that regiment after regiment adopted it; the officers found it a pleasant change from the few amusements open to them.

Polo appears to have been first played in England four years ago, when the officers of the 9th Lancers (who had learned it in India) introduced it at Woolwich, and engaged—perhaps indoctrinated—the officers of the Oxford Blues, or Royal Horse Guards Blue, in a contest. In the summer months of the next three years, the younger officers in other regiments took up the game.

We are a famous people for clubs, we English. Rowing and yachting, cricket and croquet, archery and golf, swimming and skating, four-in-hand driving, bicycle riding, pigeon-shooting, athletic sports, chess, billiards, all give rise to the formation of clubs; and these clubs impart a definite character to the several sports or games by agreeing to and laying down rules or laws for play. So it is with Polo. A Royal Polo Club has been formed, the members of which opened a special ground, two years ago, at Lillie Bridge near London. A little farther away from town, near Fulham, stands a mansion known as Hurlingham House, with pleasant grounds bordering on the Thames; it used to be a private residence, but is now the property of the Hurlingham Club. This club—

rather exclusive in its organisation—is primarily a pigeon-shooting brotherhood; but about a year ago there was appended to it a Polo Club, provided with a suitable piece of ground. These Polo Clubmen may or may not be military officers, but they must necessarily be expert pony-riders—ponies being employed instead of full-grown horses.

Thus it has arisen that Polo contests are now mentioned in the newspapers during the summer months. The Royal Club, the Hurlingham Club, and a team known as the Monmouthshire, get up matches among themselves, and also try their strength against others. The Royal against the 9th Lancers, the Household Brigade against the Monmouthshire, the Life Guards against the Royal Horse Guards, the Hurlingham against the 17th Lancers, the Scots Greys against the 12th Lancers, and so forth. Some of our legislators, who can ride horses as well as make speeches (perhaps better), have organised contests Lords v. Commons. And if the game should obtain a firm footing amongst us, it may possibly extend to other classes of horsemen (or ponymen). On a few occasions, royalty has witnessed the play at Lillie Bridge and Hurlingham; and the gratification of the victors is not lessened by receiving a silver cup or other prize from the hands of a princess.

The play so far resembles *La Crosse* (recently described in the *Journal*), that the field has two goals at opposite ends; but the two upright posts of each goal are much farther apart in Polo. There is a resemblance also in this—that the players of each party endeavour to drive a ball through the goal belonging to their antagonists; if this be done, they 'make a goal,' and thereby score a game. A game may last an hour or more, or four or five goals may be won in the same space of time, according as the fortune of war may tend. There is a uniformity of dress among the players on each side, to distinguish them from those on the other. Each player holds in his hand a stout stick, having a curved hook at the lower end; it is not long enough to touch or strike a ball on the ground without the rider stooping somewhat; and he must learn to stoop to the right or left with equal facility, and to strike the ball forward, backward, or sidewise. The ground is three or four hundred yards long, and nearly as wide. The ball is dropped on the ground exactly midway between the two goals; and then the two sets of pony-riders gallop forward, each endeavouring, by means of repeated strokes, to drive the ball through the enemy's goal. The riders, usually about five on each side, become so intermingled during the struggle, and wheel about so suddenly, that mishaps once now and then occur. Happy if only a 'spill.' As a safeguard against kicks during the scrimmage, the legs of the ponies are thickly bandaged.

From the nature of the sport, it is evident that any ten or twelve players might agree to such rules of play as they please without regard to outsiders; but it is always found in practice that more pleasure is in store for players, if all the clubs agree to the same set of rules; seeing that club can then contend against club, and holiday meetings be better held. Some few months ago the rules of the Hurlingham Polo Club were printed, after several modifications; and we will briefly notice them, stripped of their formal technicalities. The two sets of players are to be drawn up behind their respective goals, and to start for-

ward on a flag being dropped as a signal. None but players and umpires are allowed to be within the bounds of the field or ground. The ponies ridden by the players must not exceed fourteen hands high. The goals are not to be less than two hundred and fifty yards apart; the space between the two posts of each goal eight yards. No spurs to be allowed with rowels, except on special occasions sanctioned by the committee. Each side nominates an umpire, unless it be mutually agreed to play with one instead of two. The decision of the umpire or umpires is to be accepted as final. The ball to be used is three inches diameter; and sticks as well as ball must be approved by the committee. No player is allowed to hook an adversary's stick, either across or under the adversary's pony. Should a player's stick be broken, he must ride to the appointed place where a new one can be obtained (his team, we presume, being deprived of his services for a few minutes). If a player drop his stick, he must dismount to pick it up, but must not strike the ball while dismounted. A player may interpose his pony before his antagonist, so as to prevent the latter from reaching the ball, whether in full career or otherwise—despite the immediate neighbourhood of the ball. A player is 'before his side,' if in front of the player on his own side who is hitting the ball, and has not two of the opposite side between him and the enemy's goal; in this and in some other cases, he is pronounced 'off his side' or out of the game; he cannot regain his privileges, and become 'on his side' again, until a hit at the ball has been made. When the ball is driven past either side of the goal instead of through it, the side defending that goal are entitled to a hit-off. When the ball is hit out of bounds, it must be thrown in again by some impartial person (not interested in the success of either team more than the other). The dress of the Hurlingham Club Polo-players consists of light-blue jersey, light-blue forage cap with silver band, light-blue belt, breeches, and Blucher boots. In any match between two teams of the Hurlingham Club, one team is to wear red caps instead of blue, the better to distinguish them.

It is a source of amusement to those who have not risen to the dignity of 'experts,' to read the compound of enthusiasm with technical lingo contained in a professional description of any contest at a game or sport. This applies to Polo as well as to Rowing, Billiards, &c. Take the following, which almost makes the reader believe that he himself is a Polo-player: 'Mr Brocklehurst, although he sprained his ankle, pluckily remounted, and a long run followed—down the ground, then back again; then Blue for the second time being within an ace of making the goal. The ball was again struck off by the Lancers, and some fine rallies followed: the play for a long time being in the centre of the ground. Twice the Lancers got the ball to the end, but their opponents brought it back; and after a short scrimmage, Mr Brocklehurst got the ball well away, and by some clever manœuvring soon had it in a line for the goal, but unfortunately missed a well-intended winning hit. Again the Lancers made a gallant charge, and got the ball on neutral ground. Good play then followed on both sides; &c.'

In our busy towns and cities, space has become too valuable to allow much scope for Polo-playing;

but there is no reason why, in country districts, the game should not be encouraged. Good horsemen are to be found amongst us, outside as well as in the ranks of cavalry regiments.

Another game for horsemen, still more recently introduced into this country than Polo, is *Tent-pegging*. The name is a somewhat clumsy one; for to peg a tent is to fix it by means of pegs driven into the ground, whereas the game consists in forcing a peg out of the ground. However, let this pass; perhaps 'tent-pegging' is the nearest equivalent to the oriental name *Nézé-baz*. The Turcomans, Afghans, and other tribes of Central Asia, as well as the Sikhs, Mahrattas, and Scindians of India, have long practised this game. Passing so much of their time as they do on horseback, they are just the men to appreciate it, and to know its value as a drill-training. They must learn to keep a good seat, to train the eye in measuring distances, to be firm in grasping the lance, yet nimble in using it, and to have steady nerve.

The British officers stationed in India had often witnessed the game, especially among the Irregular Horse of the Anglo-native regiments, comprising many first-rate horsemen and splendid players. It was thought that, during the leisure hours of a camp, tent-pegging might form a pleasant alternative to the strangely named *pig-sticking*. This said pig-sticking (in which the Prince of Wales tried his skill during his recent visit to India) is really boar-spearing on horseback. It is said to combine the excitement of steeple-chasing with that of fox-hunting. Old boars are cunning fellows; having been once hunted, they are difficult to dislodge, and often refuse to budge out of their lairs into the open ground, whatever may be the array and the noises of the beaters. To prosecute a successful hunt, a line of spearmen get well under cover, and a signal is given by a party of scouts; a line of beaters advance, sometimes silently, sometimes to the sound of noisy instruments, as the nature of the jungle or bush seems to render most expedient. It is the beaters' work to drive the boars into the open. When a boar appears, a shout is given by the beaters, and the spearmen gallop up. On they go, boar first, spearmen following, helter-skelter over the open ground—a well-trained horse enjoying the sport as much as his rider; until at length one of the party drives his spear into the discomfited boar not always without bringing his horse or even himself to grief. A horseman accustomed to the use of a spear or lance in this way is on the high-road to being a good tent-pegger. Lord Napier of Magdala encouraged the British cavalry to try the game in the Punjab. The 5th Royal Irish Lancers began it at Sealkote three years ago, and acquired a fair amount of skill; they were followed by the 4th and 11th Hussars, and these by other regiments of horse. It is found that only a few men in each corps become really skilful at it. When the 5th Lancers returned to England last year, they brought the game with them, and played it at Hurlingham in presence of the Prince of Wales and the Duke of Edinburgh.

However difficult to play, there is but little to describe in the game. A wooden tent-peg is driven into the ground, with the upper part protruding a certain number of inches. A horseman gallops past it, lance in hand; he stoops, lowers his lance

to a sufficient distance and at a proper angle, and aims the point right at the peg. If the aim is a good one, he forces the peg out of the ground, and wins the game, or scores one towards his game; but there are many chances to one against his exactness in direction, angle, and force, while rushing on at full speed.

THE MONTH:

SCIENCE AND ARTS.

TWENTY-SEVEN years ago, when Lord John Russell was Prime Minister, he wrote a letter to the President of the Royal Society to the following effect: 'The government are continually appealed to for assistance in carrying on scientific inquiries and mechanical inventions. We are not qualified to judge of the merits of the schemes thus presented. Would the Royal Society undertake to distribute a thousand pounds, if voted by parliament, among applicants who might be considered deserving of assistance?' The Royal Society undertook the offered trust; and thus originated the Government Grant Fund, which, voted annually by the House of Commons, and administered by a numerous Committee of the Society with habitual painstaking, has aided in the increase of 'natural knowledge,' in tedious and difficult investigations, and in bringing the results before the world. Reports of the expenditure, with particulars of the sums allotted, are published in the parliamentary blue-books, and in the *Proceedings* of the Royal Society. These Reports make it clear that the Society use no part of the money for their own purposes, nor in payment of salaries; but that all is spent in the advancement of science. There was one year in which they declined to receive the one thousand pounds, the applications for aid having been too few and unimportant.

To this annual grant it is now proposed to add four thousand pounds a year during five years, in pursuance of the recommendations of the recent Science Commission, in order to fulfil what some people regard as a duty that government owes to science. It will also be a more or less instructive experiment on the 'endowment of research' question. Five years will suffice to shew whether there are anywhere in the realm mute inglorious Herschels, or 'Boltons, or Faradays, who by a touch of gold are to be stimulated into scientific activity. It is arranged that the government are not to hand over the four thousand pounds, but are to make allotments therefrom under the advice of the Royal Society.

From all this it is clear that the time has come when any person struggling to accomplish really good scientific work may apply for assistance with reasonable hope of success. If dreamers and over-sanguine speculators apply, and fail to make out a good case, they must submit to be disappointed. And it would be well that the advocates of endowments should moderate their expectations. There is much to be said on the other side. Adam Smith, whose wisdom has long been recognised, expressed his views on the subject to a former generation. What those views were was made apparent at the 'centenary' meeting recently held in honour of the sagacious thinker. At that meeting, the foremost political economists of E-rope united in recognising the merits of the

obscure Glasgow professor who, as one of the speakers remarked, 'after Shakspeare reflects most honour on England.' It will perhaps surprise many readers to learn that the same obscure professor was as far in advance in his views on education as in those on the Wealth of Nations. As Mr Lowe eloquently said: 'He' (Adam Smith) 'attacked the doctrine of fostering education by endowments. He says if you do this you make a man lazy, and he will not work. He says people should be at liberty to find out where people will teach them the things that they require, and that the Scholarships and Fellowships, and all eleemosynary attractions of that kind, should not be connected with particular places, forming a bribe to people to go to those places, independently of whether they get good instruction there or not; but that their possessors should be allowed to take them with them wherever they go, if they have once fairly earned them by competition. That if a man goes to a college, and he finds that it is not a college suited to him, he should be allowed to quit it and go to another, so that there might be competition between one college and another, and the choice between them should be within the pupil's power.' Adam Smith wrote thus a hundred years ago, and the nation may well be proud that produced such a thinker.

Dr Forbes Watson, Director of the India Museum, is pushing into notice a project which, whatever else may be said of it, deserves careful consideration. It is to build on the Thames Embankment between Whitehall Place and the Board of Trade a stately building to contain the India Museum and the Museum of the Colonies. There is already, as many readers know, an India Museum at South Kensington; but as Dr Forbes Watson argues, the unsuitability of the building, and the distance of the locality from the centres of public and of business life, render it impossible to give a practical effect to any plan of organisation which would develop the full usefulness of the India Museum as a public institution. And with this it is proposed to combine the Indian Library, the Royal Asiatic Society, and an Indian Institute for lecture, inquiry, and teaching. Thus, in one building there would be brought together 'the whole of the materials available in this country for the study of Indian literature, arts, sciences, and history, as well as for the investigation of its present political, social, and commercial condition.' Then, when we consider the wide range of our colonial possessions, the diversity of their resources and of their products, we become aware that the proposed Museum for the Colonies would be instructive and interesting to an extent scarcely to be imagined. Any one requiring further information will find it in Dr Forbes Watson's pamphlet, published by Allen & Co.

If the building here proposed and a new Mint were erected on the embankment, that spacious thoroughfare would be still further embellished. The Deputy Master of the Mint in his last annual Report makes an earnest appeal for a new building. The demand for coinage is now so great that the old Mint on Tower Hill and the machinery therein are no longer fit for their purpose. The number of pieces coined in 1875 was more than thirty millions and a half, exclusive of bronze coins struck at Birmingham by private contract; from which a notion may be formed of the work

required. During three weeks the machinery was stopped for repairs, and much loss and inconvenience were occasioned by the consequent suspension of coinage. Another point for consideration is that coining has become a scientific operation in comparison with what it was formerly; hence a proper building and the best machinery are essential to answer the requirements of the present day. Tests are now so delicate, that the debasement of the standard arising from absorption of oxygen during the pouring out of the molten metal can be detected.

In 1875 there were melted at the Mint and cast into bars ready for rolling, twenty-six and three-quarter tons of gold; of silver, one hundred and fifty-six and a half tons; and of bronze, two hundred and twenty-four tons.

The question of a fireproof building material seems as if it were about to be solved, if statements made at meetings of the Institute of British Architects may be accepted as evidence. The material is concrete. An instance was mentioned of a building which had been completely gutted by fire; but the walls, constructed of Portland cement concrete, with ironwork imbedded therein, 'withstood the fire perfectly, and were the only parts that did withstand it.' It has been proved by conflagration and by experiment that iron doors will not resist intense fire. They warp and eventually crumble away, while concrete doors remain unaffected. It would now be possible to construct a warehouse or any other building entirely of concrete, for stairs, window-frames, door-frames, and indeed nearly every part may be finished without the use of wood. In St Paul's Cathedral that portion of the dome open to the public is shut off from the other part by fireproof doors of concrete.

In the present state of the labour-market, a means of diminishing quantity of material and cheapening construction can hardly fail to be acceptable. Mr Lascelles says he 'is sanguine of being able to build four-roomed cottages of a respectable and ornamental character, at a prime cost of one hundred pounds each.' In these cottages the walls are not more than one inch thick, and yet they resist damp perfectly, which is more than can be said of nine-inch brick walls. He says, too, that where a number of window-frames are wanted, it is cheaper to make them of concrete than of wood.

In Canada Buildings, Westminster, there are concrete doors, 'moulded on the face in six panels, thin, light, and perfect in surface, ringing with a clear metallic sound, apparently quite homogeneous, and as perfect in appearance as any ordinary material.' Concrete can be used for roofs as well as for walls and floors. Mr Tall states: 'I determined to see how far I could go on constructing roofs sufficiently thin to answer the purpose of a slated and timber roof. My first experiment was on two small dwellings at Dulwich. Those roofs were completed last autumn; they have stood the heavy rains and great weight of snow of last winter, and I can positively assert that not a crack or drop of water (inside) has made its appearance. The roofs are as sound as on the day they were finished. On one occasion I allowed the rain to accumulate on the roof till it ran over the parapet, and the result so increased my confidence, that I am building two more houses of a different class. There is no thrust on the walls, there are no slates to blow

off, and no repairs are required.' Of course all this implies that really good concrete shall be used. Readers who wish for further information should procure the *Sessional Papers*, published by the Royal Institute of British Architects, Conduit Street, London.

The two special assistants of the Sanitary Commissioner with the government of India have published a Report on 'The Soil in its Relation to Disease,' which has especial interest, inasmuch as it may be regarded as a commencement of observations of telluric meteorology. The air above the surface of the earth, as everybody knows, has long been the subject of observation. In the present case we have observation of the air below the surface, chiefly with a view to ascertain the fluctuations in the amount of carbonic acid in the soil, and whether it was affected by rainfall, by the general water-level, or by wind.

The observations were made by means of tubes buried at a depth of three feet and six feet in the alluvial soil on which Calcutta is built, and were carried on through an entire year. Similar observations were made at Munich during the same period; and the results have been compared. In Munich the points of maxima and minima appear to be determined by temperature; in Calcutta by moisture. There were two maxima and two minima within the year. No definite effect could be traced either to temperature of the air, of the soil, or to the movement of the wind; but a 'general coincidence of conditions' was found between 'the principal periods of rainfall' and 'the principal periods of elevation in amount of carbonic acid,' and the reverse. A similar effect is produced by the general water-level. But it is to be remarked that it is the lowermost stratum which is most affected by the water-level, and the uppermost by the rainfall.

Two sets of observations were made at the same time, in localities about fifty yards apart: hence one set could be used as a test for the other. An important fact was discovered—namely, that the amount of carbonic acid in the soil varies in different localities. In this case the distance was not great, and the sites were at similar and corresponding distances from one and the same building; and, to quote the Report, 'the processes going on in the soil in the two places must have differed materially, in degree at all events, if not in kind; and if such processes occurring in the soil have any influence on health, it is obvious that people inhabiting one end of the building must have been exposed to different hygienic conditions from those living at the other end.' Here we have a fact that deserves serious consideration, for it may have a bearing on the apparently inexplicable isolated outbreaks of cholera question: instances of which occur every summer in India.

In all cases of observation of natural phenomena, long series are required before their significance can be discovered; and so we must have years of observation of underground meteorology if we are to find out their value and learn to apply them. Enough is at present known to make it worth while to carry on systematic observations in different countries, and thereby accumulate data for test and comparison. The authors of the present Report, Dr Lewis and Dr Cunningham, have made a good beginning, and by means of tables and diagrams they enable readers to verify their conclusions. We hope their example will be followed.

Is there anything in the differences of carbonic acid in the soil, which would help to explain some of the puzzling phenomena in Dr Tyndall's experiments on diffusion of germs?

An American doctor of medicine having heard of the discovery made in France, that pain could be relieved by hypodermic injections of cold water, resolved to try the experiment. His first case was a woman who, during three years, had suffered so severely from lumbago that she cried out with pain on the slightest movement of the muscles of the back. The doctor injected ten drops of cold water under the skin in the lumbar region, on each side of the spinal column, and in less than a minute the patient felt relief. 'She stood up without pain, sat down without assistance, and in less than five minutes after the injection, picked up a pin from the floor with ease.' Some time afterwards, the pain returned, but was mitigated the next day by acupuncture without injection, and the woman who had been so long crippled was able to work at a sewing-machine. Another case was rheumatism of the ankle-joint, cured by injection of ten drops of cold water; and a third was nodular rheumatism, involving the shoulder, elbow, wrist, and knee-joint of the right side. Here, again, the injection of cold water gave relief within five minutes. 'I repeated these injections,' says Dr Dossan, 'two days after, when the left knee was attacked, with a like favourable result. In all these cases, slight complaint was made at the moment of injecting the water, of a burning sensation; but not more, I imagine, than when any other fluid is used for a like purpose. In this last case, I injected ten syringe-fuls of water at one visit, so there is no danger from the quantity employed.' It certainly is a most valuable and ready means of relieving pain, particularly in rheumatic cases. Full details of these and other cases are published in the *New York Medical Journal*, No. 135.

The same periodical contains further accounts of cure of cysts and tumours by means of electricity. Ovarian tumours even yield to this potent remedy. Dr Smecler, after describing cases successfully treated, remarks: 'Whenever two needles connected with the poles of a battery are introduced into a solution of salts, into any liquid that contains albumen, into a blood-vessel, into a tumour filled with a liquid, or into any animal tissue, a decomposition takes place. . . . I believe that under electrolysis in the ovarian cyst something must take place like that which results in an albuminous fluid by the introduction of both poles. Not only is the liquid resorbed, but the very wall of the cyst undergoes such a change that further secretion of liquid is brought to a standstill.'

A notion has got abroad that billiard balls are explosive, because artificial ivory is made from a preparation of gun-cotton. We are assured by Messrs Orme and Sons of Manchester, who advertise themselves as sole agents for the sale of the 'cotton billiard balls,' that there is no danger in the use of this artificial ivory, and that the balls cannot be made to explode, even by smashing under a steam-hammer.

In answer to inquiries, we mention that economical gas-burners can be procured from J. Scholl, 41 Berwick Street, Soho, London.

OBJECTORS.

OBJECTORS are of various classes. Some people, from their naturally cross-grained notions, object to almost everything. They maintain a disputatious humour, and are always glad to have something to argue about. To assent at once to any of their whimsical propositions is not what they like. They do not argue for truth, but for victory. Should you give in to them placidly, you only leave them considerably dissatisfied. In the treatment of questions raised at public meetings, you do not find objectors seconding a motion unless it be something particularly offensive. They usually prefer to vote for 'the amendment,' whatever it is, and embrace the opportunity of pouring in a broadside of acrimonious remarks, in which respect they succeed in constituting themselves a general nuisance. Of course, by being habitual opponents of all rational propositions, they are apt to lose the respect of every one but a few persons like themselves; but that they do not mind. They glory in shewing their independence of conventional ideas, which they ordinarily associate with some kind of corrupt or improper motives. In short, they feel a call to object, and they are objectors accordingly.

Though undoubtedly troublesome, objectors fulfil a useful part in the community; they act as a drag on the wheels of progress, and serve to keep the machine from going too fast. At the least, they create discussion, and help to shew things in an out-of-the-way and perhaps true light. There are instances in history in which not a little mischief was done for want of a resolute body of objectors to popular and almost insane fancies. Such was the case at the outbreak of the French Revolution, when men, crazed with theories that would now be laughed at, were allowed to turn society upside down. In our modern constitutional system of government, the 'Opposition,' as it is called, is known to do good service by throwing in delicate objections to a variety of proposed measures, and, though at a terrible waste of time, it and the party it opposes contrive in the long-run to settle

matters in a tolerably satisfactory way. That which alone provokes remark, as something ridiculous, is the constant cropping up of absurd crotchets that any man in his senses might know could never meet with public approbation, yet all which crotchets have obviously their admirers among the race of conscientious impracticables. Habitual objectors, who may be said to take their stand on the principle of only supporting what the bulk of mankind view with extreme distrust, are generally found in the same lobby with crotcheteers. They mean no offence. It is their way.

In the outset of the railway system about forty years ago, great scope was offered for the operations of objectors. 'There ought to be no railways, because the snorting of the engines and noise of the passing trains would so seriously frighten the cattle and sheep in the adjoining fields as to ruin the business of the farmer.' That was objection number one, and it was very powerful—'the farmer' being a pet object of solicitude, supposed to be unable to take care of himself, and standing much in need of special legislative protection. 'Railways will drive horses off the road; the breeding of horses will cease; should a war occur, the cavalry could not be mounted; the trade in horses will be ruined.' That, cumulatively, was objection number two; if not powerful, it was very plausible. 'Railways will be the ruin of tradesmen in country towns, for their customers will be always flying off to make their purchases in the metropolis, or some great city, and if you ruin tradesmen in country towns, you take the legs from the national finances.' That was objection number three. 'Railways will intrude upon and break up the finest scenery in the country, and all natural beauty will be gone.' That, and similar raving, constituted objection number four. It is amusing now to look back on all the nonsense that was put forward as good argumentative reasons why there ought to be no railways, of which this is a sample. Country gentlemen, who ordinarily lead the forlorn-hope against all projects of improvement, backed up objectors on the occasion. As regards the alleged ruin to the breed of horses,

the objections were particularly frantic. How stands the matter now? So far from the trade in horses being ruined, there are more horses bred than ever, and the price of these animals has risen from fifty to a hundred per cent. Cattle and sheep in the fields adjoining railways have learned to pay no attention to the trains, and treat the snorings of the locomotive with a marked degree of contempt. Railways have not ruined the tradesmen in country towns; on the contrary, these towns have become more prosperous, and all varieties of tradesmen along with them. Railways wend their way through picturesque valleys and along mountain sides, without apparently doing any material damage to the scenery; in point of fact, scenery is now disclosed that was formerly beyond the reach of tourists. Such, in a few words, are the results of the manuring objections to railways, that formed the staple of opposition to railway schemes within the recollection of middle-aged men.

In much of the opposition that was presented, objectors had reason to lament their short-sightedness. Their obstruction brought its own punishment. Successfully they prevented railways approaching their own estates, and afterwards seeing the extent of their folly, they gladly encouraged schemes which would in some measure redeem the error they had committed. The authorities of certain towns, in a spirit of obstruction, committed a similar blunder. Professing to be afraid of the injury that railways would inflict on the community, they succeeded in keeping leading lines of thoroughfare at a distance. The objectors saw their error when too late, and were fain to promote the extension of cross-lines to their precious preserved towns. It need hardly be said that the silly and often tactless obstruction given to railway projects enormously increased the cost of these undertakings. Perhaps it would not be too much to say that objectors of one class and another caused a wholly unnecessary outlay of two hundred millions sterling.

Selfishness and weak-brained prejudice have generally been supposed to lie at the root of the objections originally entertained to railway extension, as well as to a number of important public undertakings. But intermingled with selfishness and prejudice there is an ever-prevailing cause, for which objectors are scarcely accountable. It is the want of imagination. Vast numbers of persons seem unable to conceive what any place would be like under new conditions. They see a town as it is, but not as it may possibly be made. The idea of broad thoroughfares running through clusters of dingy narrow streets and lanes, is beyond their powers of conception. You explain what you intend to do in the way of improvement, and they only stare in stupid incredulity. Allowing for this mental deficiency, we have little reason to wonder at the hosts of objectors to well-considered schemes for the sanitary improvement of cities, for introducing copious supplies of fresh water to towns and villages, for preventing the pollution of rivers, and so forth. Along with a certain imperfection in the imaginative faculty, the overruling sentiment in these objectors is selfishness. Unable to appreciate anything better,

and satisfied with things as they are, they fear the imposition of small rates to put matters on an improved footing. What care they for pure air, for pure water, for the absence of epidemic diseases, when the remedy involves the laying out of money! Perish health, perish thousands of lives, but save the pocket! From instances within our knowledge, an apprehension of having to contribute so small a sum as eighteenpence a year has defeated schemes of improved sewage and water-supply. Some years ago, a scheme for supplying a large city with a copious stream of pure water from a lake which absolutely seemed to be provided by nature for this beneficent purpose, was defeated by the outcry of prejudiced objectors and interested rate-payers; an inferior and cheaper scheme being adopted, which has all the appearance of being a bungle. Cheap projects of this kind are unfortunately apt to prove the dearest in the end. Meanwhile, however, objectors have their triumph.

In those lower departments of society which do not come much to the front, there are hosts of arguers and objectors of a very original turn of mind. With the barest elements of education, unacquainted with science, and ignorant of history, they set themselves up as profound thinkers on matters of serious public concern. For example, in looking over newspaper reports of cases before magistrates in the metropolis and elsewhere, one cannot help being struck with the number of individuals brought up on the charge of neglecting, and even absolutely refusing, to have their children vaccinated. From the extreme liveliness of its proceedings, Dewsbury, in Yorkshire, seems to have entered on a course of determined opposition to the practice of vaccination within its precincts. Such are pitiable and curious instances of ignorant and perverse objectors. They speak of having an objection to communicate a disease with the view of averting another, and hence, as they allege, conscientiously disobey the law. They conveniently plead conscience for committing a private and public wrong. We fancy that the persons guilty of this species of perversity do not read, at least do not peruse works like the present, and it almost seems hopeless to address them. Yet, it appears a duty to do our best to warn them of the grievous error with which they are chargeable. In plain terms we shall tell them what they are doing.

Small-pox is a virulent epidemic to which mankind, particularly the young, are liable. The body is covered with a vile eruption, the countenance is swollen and disfigured, the eyes are nearly blinded, and the spectacle presented is to the last degree loathsome. Few recover from this terrible complaint. Those who do, are generally scarred. Many are blinded for life. In the early part of the present century, to which our recollection extends, persons pitted with marks of small-pox were quite common. Fine female countenances were disfigured in a hideous manner. Poor wretches blinded with the disease, were seen going along the thoroughfares led by dogs, and begging for alms. Yet, at that time, the evidences of small-pox had considerably abated. The disease was at its worst a hundred and fifty years ago. The first thing that gave it a check was inoculation. It was somehow discovered that if a small quantity of matter was taken from one afflicted with the disease and communicated by a

puncture to the arm of a young person, it gave small-pox in a mild form, generally without any injurious consequences. This was a great discovery, but it had one fatal drawback. From the mildest case of inoculation, the disease in its most awful form was susceptible of being communicated by contagion to neighbours and onlookers not inoculated. Inoculation was, therefore, anything but a general preservative, and something more was wanted.

So stood matters towards the end of last century, children here and there being inoculated—the writer of this for one, in 1800—when Edward Jenner comes upon the scene. Jenner was a pupil of the famous John Hunter, and practising as a physician at a country village in England, a young countrywoman came to ask his advice. The subject of small-pox being mentioned in her presence, she observed: ‘I cannot take that disease, for I have had cow-pox.’ Here, in a singularly incidental manner, was a marvellous discovery revealed to Jenner. On inquiry, he found that girls who milked cows were apt to catch an eruptive complaint from handling the udder of these animals, which, while not virulent in its effects, completely steeled them against small-pox. Many investigations with suitable experiments followed, and at length in 1798, he published his first memoir on the importance of inoculating with lymph from the udder of the cow—called by him vaccination, from *vacca*, the Latin word for a cow. His discovery was soon promulgated over the civilised world. By numbers, even among the learned, it was hooted as an absurdity, and some who should have known better, imagined that vaccination would communicate certain cow-like propensities to the young who were so treated. These strange prejudices were speedily consigned to oblivion. Objectors could not gainsay the fact that vaccination, while doing no harm to the infant, was an effectual preventive of small-pox. Honours and public rewards were heaped on Jenner for his great discovery. He lived to see vaccination universally introduced, and died as lately as 1823.

A notion has been sometimes entertained that though vaccination stamps out small-pox, it produces or allows the outbreak of other complaints in the system. This is a mere supposition. Care has only to be taken to employ the pure lymph from the cow, or at least not to continue vaccinating too long from previous cases, and not to vaccinate from unhealthy subjects. With these precautions, which it is the duty of medical practitioners to attend to, there is no evidence that vaccination any way injures the constitution. In short, rightly effected, vaccination in no case contaminates the system. It simply, and by some mysterious cause, prevents the young from taking small-pox in the natural way by contagion; on which account, from the vast saving of human life, Jenner will ever be ranked as one of the greatest benefactors of his species. The legislature has done quite right to inflict penalties on those weakly prejudiced persons who wilfully fail to present their children for vaccination by medical practitioners. On this point, the law is imperative, and no sympathy can be extended to objectors. The loss of a single life through want of vaccination may concern only the parents interested, but that is taking a narrow view of the matter. If vaccination be neglected, there is a chance of small-pox resuming its epi-

demio character, and committing frightful ravages on the population. Hence, an objector to vaccination must be treated as a dangerous public enemy. W. C.

CHAPTER XXXVIII.—A LOVER DISMISSED.

ALTHOUGH Kitty strove to comfort her sister all she could, she was herself filled, not indeed with sorrow for Jenny's plain speaking, for that had her secret approbation, but with apprehensions for the result of it. She felt that there was now a gulf between their late friends at Riverside and themselves, which it would require all her address to bridge over; and they were in such sore need of friends. And Jenny on her part was consumed with regret that she had distressed her sister. As to Mrs Campden and Mary, she had washed her hands of them for good and all; and even with respect to Uncle George—she could never think of him as Uncle George again; he had shewn himself weak beyond expression: whatever she had said (I am afraid she did not quite remember what she *had* said) fell short of his deserts, and she did not repent it; but she regretted having selfishly given way to her own impulses. She felt that others might be made to suffer for her audacity, who, unlike herself, would have preferred to be patronised, and humiliated, and laid under obligations, rather than starve. What right had she to indulge her passionate indignation at the expense of her sister, and poor Tony, and the unconscious babe? These bitter reflections occurred to her, as she lay upon her couch in the drawing-room, racked with pain, and trembling with the excitement of her late interview. Kitty had been summoned to the baby, and there was no one to interrupt her solitary thoughts. She had not wept since she had seen her mother laid in her grave that morning; the fountain of her tears was dry, and where it should have been, there was a fire that seemed to burn up her very brain.

Where was justice—for it was idle to talk of mercy—where was barest justice fled? What had they all done to deserve so hard a fate? (Could not the merits of that late departed one win for her beloved children a spark even of hope? (She had talked of hope to Mr Campden, in a momentary spirit of pride, but she had, in fact, next to none.) Was there no such a thing as genuine friendship in the world? friendship that would stand the test of—

‘Jenny!’

‘My dear Jeff, how you frightened me!’ cried she, holding out both hands. ‘I thought you had gone home with the doctor.’

‘What! without having had one word alone with you and Kitty? No; I only waited till my betters had had their say.’

‘You mean Mr Campden?’

‘Yes, of course. But why speak of him in such a tone.’

‘Oh, it’s a long story. I have been a little angry with him because he is rich and we are poor; that’s all.’

‘Well, but that was very wrong. I am going to be rich, some day.’

‘“Some day,” my poor Jeff!’

‘Now, don’t call me “poor,” whatever you call

me,' returned he, smiling; 'people in the City don't like it. I was really in earnest, when I said "some day;" and I mean some early date, *proximo* (you have no idea how classical we are in our business letters). I have not told a soul save yourself, but I should not be the least surprised if Holt was to make me his partner.'

'What for?'

'Well, that is scarcely complimentary, Jenny. How do you know that I have not exhibited a great commercial genius? Seriously, however, it is because he finds I am an honest man—quite a *lusus nature*, I assure you, in his particular line.'

'But you are not a man at all, Jeff; though I must say you look very like one. How you are grown and filled out! You have got to be quite good-looking! and how becomingly you blush.'

'Yes; that is why I am so valuable to Mr Holt. If one cannot blush one's self, it is something to have a confidential clerk who blushes. Of course I was joking about a partnership, at least for the present; but there is no calling in which a man can become rich early so easily as in ours. And upon my word, I've hopes.'

'Ah, dear Jeff, how I envy you!' sighed Jenny. 'How I wish I could see any prospect of making a little money!'

'Well, well, don't despair. Of course that depression in the lace-market—the unexpected alteration in the quotations—was very disappointing.'

'It was worse than that, Jeff. Can you imagine anything so base as that woman's telling Mrs Campden of my application, although I had put "Private and confidential" upon my little note to her?'

'I can very easily imagine it, my dear Jenny. I have witnessed too many delicate "operations" though not in lace—to be astonished at anybody's baseness. However, you have another string to your bow, remember.'

'O Jeff, have you any good news of that?'

'Not at present: but then there is no bad news.'

'Good. I have been schooled to be thankful for small mercies. I shall ask no more questions.—Here is Kitty; perhaps you would like a word with her alone;' and Jenny was off in a moment.—Kitty entered the room with a roll of flannel in her arms, which was the baby.

'My dear Jeff, I can't shake hands, you see.—Oh, you naughty boy!' For the young gentleman, since he could not shake hands, had saluted her with his lips.

'I thought that was what you meant, Kitty,' said he, with simplicity.

'You thought nothing of the kind, sir; and I am very angry with you; or at least I should be, if I had the heart for it.—How nice it was of you, dear Jeff, to come so far for a single day, just to—'

'Don't talk like that, Kitty: your dear mother was the kindest friend I ever had or ever shall have; and your poor father'—

'O Jeff, do not speak of him as though all hope was gone!'

'I did not intend to do so, Kitty; I only meant that he was to be pitied, as indeed he is.'

'Ah, if he only knew! I scarcely venture to wish him to be alive, when I think that, if he is not, dear mamma and he may be even now

together. I know not what to hope, nor even to pray, Jeff. Things are very, very bad with us; and yet we are told that they will be so much worse.'

'Who says that?' said Jeff, with a flash of his black eyes. 'He was a brute, whoever he was.'

'Well, it was a lady, my dear Jeff.'

'Let us say a woman, Kitty. I can guess who the person was. She told you that it was her duty to speak the whole truth, did she not? We have people in the City who tell us the same, and who are not believed by anybody. If your father is dead, then of course things are bad indeed; but even so, there is some one else, to whose care he confided you when he went away; a friend who will never desert you while life is in him.'

'Alas, he has already deserted us, Jeff; or rather, I am afraid we have seriously offended him.'

'I think you must be mistaken there, Kitty.'

'No, Jeff; it happened this very day. You must not speak of it, because it would hurt Jenny. But I feel we can no longer count upon Uncle George—that was.' And Kitty stooped down over her unconscious burden, to hide her tears.

'But I don't mean Uncle George at all,' answered the other gravely. 'It was to another person that your father spoke these words when he left Riverside: "Remember, you are their only protector now." Yes, it was to me, Geoffrey Derwent. I was a boy then; but those words made a man of me. They are engraven on my heart; so that no change nor time can ever erase them.'

'O Jeff, dear Jeff, did he say that?'

'Yes, darling; and more than that (though I did not mean to tell you it for a long long time; till I should be in a better position to—to speak of such things)—when he was going away—perhaps for ever—and my heart was full for his sake, I thought it would be wrong to keep it a secret from him; and I told it, Kitty.'

She was sitting on the sofa, with her head bent over the child, so that he could not see her face, and that gave him courage—though his voice trembled, and its tone was hoarse and low.

'I told him how I loved you, Kitty; and—though I was but a boy, friendless and almost penniless—your father (God bless him for it!) was tender and gentle with me, seeing perhaps that I was speaking truth at all events. He promised nothing indeed: how could he? But he did not deny me. He said, when he came back, we two should speak together about that matter. That was not much, you may say; but to me it was a great deal—for, Kitty, you are all in all to me.—Don't answer me yet; don't treat me less kindly than your father did; only promise that some day—years to come—if it must be—that we two may speak together about that matter. But if you have—other views'—here the boy stopped, half-choked—'then tell me now, at once. I shall never blame you; I shall hope for your happiness with—with the man I am thinking of—in spite of hope.'

She shook her head. 'You are cruel, like the rest,' she murmured.

'I cruel! and to you, Kitty?' sighed he. 'O no. Whatever seems good to you and right to you, will be sufficient for me. If you say "No"—just "No" to the question that my heart is asking, I will ask no other. You shall never be troubled by me this way again. The purpose of my life as respects you and yours will be just the same. I

shall still do all that in me lies for you, for Jenny, for Tony, for that poor little one who lies in your arms. I shall be always their Protector, if not their only one.'

'What is it you want me to say, Jeff?' said Kitty suddenly. Her tears were no longer falling; she looked up at him without flinching, though her white face shewed her pain.

'Can you ask me, Kitty? It is the simplest of all questions: Do you love me?'

'We all love you, Jeff.'

The boy made an impatient gesture. 'You are fencing with me, Kitty. Yes or no?'

'I am not fencing, Jeff. I will frankly tell you that if I were my own mistress, without others depending upon my choice—others whose interests I am bound to consult before my own inclination—I might be foolish enough to say: "Boy as you are, I will trust your love, and some day intrust my happiness to your keeping." It would perhaps be folly in me, and certainly an injustice to yourself, to say as much; but you are so dear to me, Jeff, that I might have been tempted to do it. As matters stand, however, it is wholly out of the question. I might well say that on a day like this—the darkest in our lives, with the rustle of the earth upon our mother's coffin-lid still ringing in my ears—your topic is ill chosen; but I am willing to believe that your very love for my dead mother in a manner sanctifies your love for me, and excuses the expression of it. Let me say rather, that neither to-day, nor for many days—nor perhaps for many years to come—is it likely that marriage will be in my thoughts at all. They will be occupied, dear Jeff, with very sober, very simple, and what most folks would call, with very "uninteresting" things: the making both ends meet in a very humble household; the feeding, and clothing, and teaching them. If they ever get pudding, it will be either Jenny or I who will have to cook it. I shall not probably have the time or the opportunity even to read about love in a novel, much more to make it. That is the programme of my future life, Jeff. It is not pleasant; it is no use pretending that it is; but I mean to make the best of it. Pray, don't make it harder for me by saying any more.'

'I will not say a word more now, Kitty'—

'That's right,' interrupted she quickly. 'It is close upon the doctor's dinner-hour, and you must not keep him waiting. I hope you will dine with us the next time you come, and pass your opinion on our pudding. We shall be always—always glad to see you, Jeff.'

The baby was in her lap now, and she held out her hand for him to shake. Instead of doing so, he carried it slowly to his lips and kissed it.

'God bless you, Kitty!' he said.

'God bless you, Jeff!'

He looked so handsome, so honest, and so loving, that there was a struggle even in that self-sacrificing bosom to add something more; but she did not. She heard him run down-stairs, and Jenny call out 'Jeff!' as he passed, in vain, and Tony cry 'Jeff! Jeff! where are you going?' without reply; then the front door was opened and closed very quickly, but gently too, as though he who went forth had not, even in his haste, forgotten it was the house of sorrow.

Kitty moved to the window, but too late because of her little burden; there was nothing to be

seen save the thickening dusk and the slow-falling rain. He had gone.

When Jenny entered the room half an hour afterwards—she had been talking tenderly and gravely to Tony in her own chamber—she found Kitty at her mother's desk. It had not been opened since her death, but now the neat little account-books and the memoranda of their scanty incomings, were all spread out upon the table, with already a note or two of Kitty's own. Jenny took in the situation at a glance.

'Kitty!' cried she with a burst of penitence, 'I have been very wrong. It is you who have the responsibility, and the trouble, and the care of us; while I have only indulged my passion and my pride. If it is not too late—if the mischief I have done is not irreparable—pray, think no more of my opinion, of my prejudices.'

'Hush, hush, my darling; you have done no harm, or at least nothing wrong, which is the greater matter.'

'You are an angel; you are like our mother,' answered Jenny vehemently; 'and I am unworthy to be your sister. Henceforward, I will never oppose what you think right.—How is it with us, Kitty? Are we very, very poor? Will it be necessary—shall you ask Mr Campden for that money?'

'For some of it, darling; I am afraid we must.'

'And Mr Holt? We need not take that—that loan he offers; need we, Kitty? at least not yet—there may be brighter days.'

'No, dear; we will not take Mr Holt's money. No, no, no!'

There was a calmness and decision in Kitty's tone which were rare with her; her face was very pale, and wore a set expression which was new to it.

Jenny looked at her sister for a moment with wondering eyes, then rushed into her arms.

'O Kitty, I am so glad, so glad!' she cried, bursting into tears. 'Dear Jeff will be dearer to me now than ever.'

'Be silent, Jenny; don't speak of him; I can't bear it,' was the unexpected reply, delivered with strange vehemence. Then, in gentler but firm tones, she added: 'Forgive me, darling, but you have given me pain. You are wrong, quite wrong, in thinking—what you said.—Here are the bills and the banker's book; let us look over the accounts together.'

CHAPTER XXXIX.—KITTY'S DREAM.

That cynical phrase about 'not being able to afford to keep a conscience,' has a solid foundation in fact. There are some, indeed, who would rather perish than do anything contrary to their sense of what is right (though even that is a sacrifice which varies with the value men set on individual existence); there are as many more who would perish rather than endure a humiliation—who would take poison rather than swallow their pride. It is only the popular religion—a very different thing from Christianity—that has made Death so terrible as to be weighed against shame; but when it comes to the pinch, Necessity, or what we choose to consider such, overrules the law of the mind. This is a matter upon which drawing-room philosophers and comfortable divines are no judges. It seems so easy—and is so easy—to be independent, chaste, and honest, when there is

only a temptation to be otherwise; but when the temptation becomes an alternative—on the one side, poverty, debt, ruin, for example; on the other hand, competence, not only for ourselves, but for those we love—that is quite another matter. Conscience has then a new antagonist, the first of his own laws; a sense of right, almost as strong as himself, which, allying itself with these various opponents, generally succeeds in overthrowing him. That 'second thoughts are best,' among all lying proverbs, holds the pre-eminence; second thoughts in morals are never best, but only, as it is natural they should be, second-best.

John Dalton had so left his affairs that, if he should now be dead and drowned, as it was almost certain he was, he had paid up his legal liabilities, as he imagined, to the last shilling. Even the scoundrels who had 'floated' the *Lari* mine could never point at his children as the offspring of a defaulter. His shares would have been paid up in full to the last penny. But his efforts to effect this had left him impoverished indeed: all that his family had to live upon was the interest of some two or three thousand pounds, and a certain small sum which he had left for emergencies in his wife's hands. Moreover, he had unhappily omitted to reckon a few outstanding debts, such as always attend a rich man's expenditure, almost unknown to himself, and which he generally settles with a sudden cheque and a malediction upon his own forgetfulness. The creditors were of that agreeable kind—may I instance one's tobacconist!—who do not plague us quarterly, nor even half yearly, for one's little account; but who, when we start upon a sudden for Brazil, and are likely not to come back again, get naturally nervous, and would like to see the colour of our money. When I said that Mrs Dalton's correspondence had much fallen off in number since the family misfortunes, I should have made honourable exception of these gentlemen, who had not failed to send in their bills to her with the remark, that 'an early settlement would oblige.' Of course, she had acceded to these requests—which, indeed, were only reasonable—but in so doing had not left enough money behind her to defray her own funeral expenses.

This was the conclusion that Kitty was compelled to arrive at, after a careful study of the financial position of the family. Jenny did her best to assist her in the investigation; but she was not so good at figures, and chiefly confined herself to 'approving' what her sister made of them, like any City director, except that she did not get five hundred a year for doing it. They had enough, they reckoned, to go on with in their humble fashion—especially as Lucy was going—but for the present, ready-money was indispensable. Under these circumstances, there was nothing for it (even Jenny owned) but to apply to Mr Campden for some portion of that loan which he had voluntarily placed at their disposal, and which Kitty at least had certainly not unconditionally declined. She therefore despatched a letter to the squire, very warmly and gratefully worded, but at the same time expressing herself as practically as she could with respect to the money itself. If her father should return to them, he would, of course, himself become responsible for the repayment of the loan; and if God had willed it otherwise, the insurance he had effected on his

life would enable his children to repay it. A few days ago, she would certainly not have used so business-like a style in addressing her correspondent; but now—though without having adopted poor Jenny's views—she was less inclined to wear her heart upon her sleeve, even to Uncle George. By return of post, a letter came from Riverside in Mrs Campden's handwriting.

Kitty looked at the envelope with vague alarm. She had not put 'Private' outside her note to the squire, though she had felt herself inclined to do so; and was it possible that her late hostess had opened it, and replied to it, herself? She felt a flush rise to her cheek, for whatever had been her need, she would never have applied for aid to Mrs Campden, nor even to her husband, had she thought he would have made his wife a confidante of the fact. He had given Kitty distinctly to understand that the transaction would be a private one. The envelope was weighty, and contained, along with a pretty long communication, two five-pound notes. She had asked the squire for fifty.

'DEAR KITTY,' the letter began—'In the absence of Mr Campden, who is in London, I took the liberty to open your note, thinking that it might require an immediate reply. Its contents have astonished me exceedingly. I am grieved not only upon your own account, but upon hers of whom you speak—for whose sake, as you would have me believe, you have thought proper to make your very singular application. I cannot think anything would have distressed your poor mother herself more than the step you have thus thought proper to take. Let us hope, in the sphere to which she has been removed by an allwise Providence, that she is ignorant of the circumstance. What you have asked Mr Campden is, in plain English, to give you fifty pounds. There is even an allusion to a larger sum, which it seems you have been trying to persuade him to promise you, or which he has promised you of his own head. To take advantage of my husband in such a matter is, as you must be well aware, Kitty, to take advantage of a child; and it is my duty to protect him against any such attempts. However, I will confine myself to the fifty pounds. You speak hopefully, and I hope you have reason for your confidence, of your poor father's return home; but if he does return, have you painted to yourself what will be his true position? Have you—has anybody—the least cause to suppose that he will be in a condition to repay the debts of his family? One of his best friends—and your best friend, if you would permit him to be so—has assured me that he has gone to Brazil in pursuit of a mere chimera; that he will come back poorer, if that be possible, than he went.

'Now, Kitty, it is my bounden duty to speak plainly to you. It is this very carelessness of other people's money that has brought your father to this pass. He gambled away first his own fortune, and then your mother's; and now he seems to expect to use the money of his friends as though it were his own. I have good reasons for stating that he proposed to draw upon my poor husband—while abroad—as on his own banker! You are doubtless shocked at this revelation; yet, if you examine the matter, the difference between your present application and that most outrageous one is only in degree. Fifty pounds, a hundred pounds, two hundred pounds—so we go on when this

terrible course has been once begun. You think perhaps my husband is made of money, and that it does not signify how much you ask. The money, my dear girl, is nothing indeed compared with the sacrifice of principle that would be involved if it were given you, and to which I therefore, for one, would never consent. But even the money is something. Mr Campden is no doubt what some people would call a rich man; but rich people have calls of which poor people have no conception: he has his position in the county to keep up—an imperative duty—and a thousand other sources of expense, which you would hardly understand should I enumerate them. With respect to the expenses of the funeral, I have made inquiries, and considering the simplicity with which it was conducted, in accordance with your mother's wish—and which does honour to her good sense—I find ten pounds will be ample, and I therefore inclose that sum. I am very glad to find that by frugality and care you will for the future be able to make both ends meet; always live within your income, dear Kitty, and then, whatever it may be, you may account yourself rich.

'I am sorry you did not accept my proposition with respect to the baby: a home, however, will always await it at the lodge, should you alter what I must venture to call your ill-judged resolution.'

'And this brings me, Kitty, to another subject, the importance of which must be my excuse for once more breaking it to you. Do you know what you are doing, and do you know whom you are undoing, in rejecting the advances of Mr Holt? From him a loan of fifty pounds, or of five hundred, could indeed be accepted with a good grace, and would be advanced with something more than alacrity. If ever there was an example of a girl's "sinning her chances," you, Kitty, are surely now affording it. What excuse you can possibly make to yourself for rejecting what I may almost call this gift of Providence, I cannot imagine. You may have your reasons; but they are most certainly mere personal ones, and you must forgive me for adding, selfish ones. Do you reflect that it only rests with you to give to your little household a natural protector? (At present, I do not see how it is possible for you to leave home even to go out as a governess.) Some men—nay, most men—would hesitate to marry a penniless girl surrounded by encumbrances; but this man is one in a thousand; and yet you treat him as if there were another such to be picked up any day and anywhere—in Sanbeck, for example. However, I have said my say.

'Mary sends you her best love: she is making up a little parcel of things which I hope will prove useful to you: a dress or two that she has outgrown, but which we think will just suit your figure; and when the spring comes on, she will doubtless find other articles that you may make available.—Always your sincere friend and well-wisher,

JULIA CAMPDEN.'

'P.S.—I think it will be better that you should treat this note as private and confidential. Pray, consult *your own* good-sense before replying to the contents of it. Jenny has doubtless many good points, but the state of her health must alone prevent her exercising a dispassionate judgment.'

This letter was a terrible blow. There was nothing in it to give ground for absolute quarrel;

but Kitty felt that it henceforth divided her and hers from the Riverside people, as by a great gulf. She even believed that it had been written with that express object; in which she probably did the writer wrong. A more acute woman than Mrs Campden might, indeed, have expected to arouse some angry rejoinder, which would have given her a good excuse for breaking with her needy kinsfolk altogether; but the mistress of Riverside saw nothing offensive in the letter she had composed. She meant to put her foot down with respect to any further attempt upon her husband's purse; and she used the opportunity without scruple of placing Kitty's hopeless position before her, and of pointing out the one way of escape; but she had no intention of deliberate insult. She had, nevertheless, the sagacity to understand that Jenny would view her letter as such, and hence she marked it 'private and confidential.' Though she had not hesitated to break the seal of a communication addressed to another, she gave her correspondent credit for more delicate scruples—and took advantage of them. The children of this world are not only wiser than the children of light, but they trade upon their simplicity. A rogue will often deny the existence of an honest man, to save his own credit, though well aware that he is lying; but when he has found one, he will use his honesty for his own purposes.

Kitty too was well aware that Jenny would have at once designated the writer of such a communication as dishonourable, mean, cruel, and a number of other perhaps 'not wholly inapplicable adjectives. The gift of the cast-off raiment would have been especially offensive to her. Whereas Kitty, in her humility, and her consideration for those committed to her trust, was resolved not to take offence, even if it had been purposely offered to her. It was unnecessary upon Mrs Campden's part to have been so energetic against any future application to her husband. Nothing, *nothing* would have henceforth induced her to ask help of Uncle George. If the worst came to the worst, she would rather sell herself, as this woman was urging her to do, to Richard Holt. It would be horrible, it would be shameful; but the humiliation could not be deeper, and the advantage to others would be great and certain. If those two five-pound notes had been the wages of shame, she could hardly have regarded them with a more intense loathing: her fingers closed upon them fiercely, savagely; she longed to tear them to pieces; most of all, she craved to return them, with a few civil but cutting words. That money, she felt, was as much given to her out of charity—and that a charity which had no love in it—as the cast-off clothes which were to follow. She felt like a beggar (though she had never been one) who has been refused the alms he asked, and has had a crust of bread flung at him instead. If she could only have done without the crust, and have flung it back to the giver! There was one way which would, she knew, have Jenny's hearty concurrence, namely, that they should sell some article of furniture in Bleabarrow, and pay the undertaker's bill with the proceeds. But Kitty, always just, reflected that such a course would excite country gossip, and bring great discredit upon the squire, who was not answerable for his wife's actions, and indeed hardly for his own. Another alternative was to borrow the money of Dr Carzon. But they surely had had enough of

borrowing—or rather of the attempt to borrow; and, moreover, they already owed the doctor for many a professional visit. No; Kitty felt she must take these two five-pound notes, and acknowledge their receipt with words of thanks.

She had retired to her own room to read the letter, directly she had recognised Mrs Campden's handwriting, and now she meant to destroy it, before she saw Jenny; so that she could honestly say 'I have it not,' if her sister asked to read it. But hearing Jenny's knock at the door, she thrust the letter with its inclosure into her pocket, and rose to meet her.

'Well, Kitty, what news? I need scarcely ask, however; I can read it reflected in your flushed face. From a reason over which he has no control—if you can call his wife "a reason"—Mr Campden cannot keep his promise.'

'My dear Jenny, you said you wouldn't'—

'I said I wouldn't interfere with what you resolved upon. I may surely flatter my own foresight by "spotting," as Jeff calls it, these good people beforehand. The squire is weak as water: he would if he could, he says, but he can't.'

'He says nothing of the kind, Jenny. The letter does not come from him at all, but from Mrs Campden. She opened my note, it seems, in his absence.'

Jenny smiled. 'What luck she must have thought it! I can imagine her gloating over a letter meant for somebody else.'

'O Jenny,' cried Kitty reprovingly. 'The thought crossed her mind: "What strange bitterness possesses my dear sister! Three months ago—nay, ten days since, while our mother was yet alive—such sentiments would never have found harbour within her, far less expression."

'Well,' continued Jenny, 'of course she will not let her husband lend us the money, "as a matter of principle."

'It is something like that,' said Kitty reluctantly. 'She has sent us, however, ten pounds, which will, I hope, be sufficient.'

'I am glad it was no more,' said Jenny, 'for two reasons: first, because it corroborates my view of her; secondly— But never mind "secondly" for the present. Well, what else did she say, besides how fond she was of us, and how it was all for our own good? May I see the letter?'

'It is marked private and confidential.'

'That was foolish of her, because I now know what it was about. You do not wish, I suppose, dear, to talk upon the subject?'

'No, Jenny; because it would be of no use.'

'But you have not made up your mind?' cried Jenny eagerly. 'Before you do that, I must speak to you, darling; I must, I must!'

'No, dear; I have made up my mind to nothing—except that we must take these ten pounds.'

'Was there no message from Mary—dear Mary, who used to hang about your neck so lovingly but a few weeks ago?'

'Well, no; nothing particular. She is going to send us some things that her mother thinks may be useful to us.'

'What things?' cried Jenny contemptuously. 'A pot of marmalade; some shilling novels; a yard of flannel—such as they send to the hospitals.'

'There may be some flannel,' said Kitty quietly.

'Oh, I see: old clothes that are too fine for the

lady's maid. We are in the first stage of our descent, my dear; they will send us next year old clothes that are not fine enough for her. For my part, I always thought Mary a humbug.'

'Don't say that, Jenny; she is not strong, that is all. You might just as well say half the world are humbuds.'

'Half the world! I say nine hundred and ninety-nine hundredths of them are so! What saith the Scripture: "One man out of a thousand have I known." There is Jeff, for example; and there is the doctor. But "one woman in a thousand I have not known." Or, at all events, she was not Mary Campden.'

To this outburst, Kitty replied nothing; and further questioning upon Jenny's part was put a stop to by the entrance of Tony in a wild state of excitement. Something had come for him 'registered' by the post; he had met the postman in the village, and gone back to the office to sign for it; and what did they think it was! They would never guess if they guessed for ever: it was a watch and chain; a beautiful gold watch and chain!

'Why, Tony, who could have sent it?' cried Jenny, delighted at the lad's delight; then the joy faded out of her face, and she looked at Kitty, whose cheeks had become crimson.

'Well, I don't know,' cried Tony. 'I should have thought it was Jeff, only dear old Jeff could never have— The post-mark was Cornhill too, and he said Mr Holt's office was close by Cornhill.'

'It came from Mr Holt,' said Jenny; 'I know his handwriting. We must send it back again.'

'Send it back?' cried Tony, growing very red in his turn. 'Why should I send it back? I think it was very kind of him. He has always been very civil to me; and every fellow has a watch who goes to Eton.'

'I don't think we can send it back, Jenny,' said Kitty gravely. 'It is sent to Tony, you see.'

'Yes; that is so mean of him,' answered Jenny, stamping her little foot. 'He knew there would be a difficulty about returning it.'

'It would be exceedingly rude to return it, just because you don't like him,' said Tony confidently. 'If you did, you may depend on it, he would never send me anything again. See here: when you touch this button, the back opens, and there are the wheels and things. My dear Kitty, what are you at?—Jenny, Kitty is crying into my watch-works.'

And indeed, while endeavouring to be interested in Tony's treasure, poor Kitty had not been able to restrain a tear. She laughed the matter off, however, in an hysterical sort of way, and before the afternoon post went, had helped Tony with his letter of thanks to the sender: his tutor and literary adviser in ordinary, Jenny, having flatly refused to have anything to do with it.

It gave Kitty a pang, we may be sure; but since the present was to be accepted, it was needful that it should be duly acknowledged. That watch and its works cost her more than it cost the buyer; it haunted her thoughts all that day, and even her dreams at night. This is what she dreamed: She was in a room full of figures like those at Madame Tussaud's, except that they all moved by machinery. There was her dead mother looking at her with pitying eyes; and her lost father, with changed remorseful face, his hair and clothes all

wet. These and many others revolved slowly round her at some distance, but none approached her. She herself was borne slowly but irresistibly forward towards a figure with outstretched arms. It was Richard Holt. His chest was bare, and where his heart should have been, she saw toothed-wheels at work, all gold; just as she had seen in Tony's watch, only larger. She heard them moving and clicking with a harsh monotonous noise, louder and louder as she drew nigh. Then as she came quite close, the arms—a picture she had seen in a *History of the Inquisition* at home no doubt suggested this—suddenly shot out knives and daggers, and were just about to enfold her, when with a shrill scream she woke.

THE GREAT DESERT OF SAHARA MADE NAVIGABLE.

ONE of the latest wonders of modern enterprise is a project to let the waters of the Atlantic into the heart of Africa, so as to transform the great sandy Desert of Sahara into an inland sea—a kind of Mediterranean. The thing may not be practicable, but it is speculatively contemplated; and from all we can learn is feasible, the chief operation being the removal of a barrier of sandy downs, to admit the ocean into what formerly seems to have been its bed.

Let our readers take a look at a map of Africa. They will see at the twentieth degree of north latitude a great broad stretch almost across the continent, styled the Desert of Sahara, bounded on the south by the more fertile region known as the Soudan. This was the region that occupied the attention of Mungo Park, Denham, Clapperton, the Landers, and many other celebrated explorers; but the most complete examination was of more recent date, that of Dr Barth. He told us more than Europe previously knew concerning the tribes and nationalities, their languages and ethnological characteristics, their religious and moral proclivities, their commerce and industry, the natural growths of plants and animals, and the fitness of the climate and soil for various kinds of culture. We are so accustomed to associate Africa with ideas of barbarism, that we are hardly prepared to hear of Timbuctu, lying in the border region between the Sahara and Soudan, being a great emporium of trade; but so it is. Many caravan-routes radiate from it; and as the northern bend of the great river Niger approaches near the city, facilities for water-carriage as well as land-carriage are at command, along hundreds of miles in various directions. Timbuctu is also the seat of learning for this part of the world—such learning as there may be—and is also ranked as a holy city. Dr Barth, who resided there many months, was impressed with the fact that 'there is an immense field here open for European energy, to revive the trade which under a stable government formerly animated this quarter of the globe, and which might again flourish to a great extent.'

Well, Soudan being willing to buy and sell

with Europe, what channels of commercial intercourse are open? Here we begin to have a glimpse of the advantage of letting in the sea. Produce and manufactures from various parts of Europe are at present landed at the Mediterranean ports of Barbary; there they are repacked for land transport, and conveyed southward by caravans of camels or dromedaries. After crossing the Atlas Mountains by such passes as are found most suitable, the caravans plunge at once into the Great Desert of Sahara. Camels and dromedaries may possibly look picturesque when clustered into long lines on the Desert; but still they can carry only small loads of merchandise, compared with the modes of transport available in Europe; and the length of the journey greatly increases the selling price of the goods. The roads, if roads they may be called, are nearly in the same state now as they were in the days of the Carthaginians and Romans. Some of the caravan routes are sixteen to eighteen hundred miles long, taking months of travel to accomplish.

But are there no routes to Soudan except the route across the Desert of Sahara? There are. The distance is far less from the Atlantic coast on the west, than from the Mediterranean coast on the north. Unfortunately, however, certain difficulties of other kinds crop up. Our own troubles with Ashanti and Dahomey tell us how precarious would be the fate of a caravan of English merchandise through the territories of the black potentates of those countries. On this account, what are called the Ivory Coast and Gold Coast of Guinea are scarcely available as starting-points. Farther down into the Bight of Benin, along the Slave Coast, to the mouths of the Niger, the hot swamps of the interior are so frightful that English merchants may well dread them. Going, on the other hand, round the great bend of Africa to Sierra Leone and Senegambia, we come to a region colonised to some small extent by English and French. Last autumn there was a discussion in the *Times* concerning the feasibility of a trade-route from the Gambia to Timbuctu. Our government at that time had a project for handing over the few and unprofitable possessions of England in that quarter to France. A writer, protesting against this, urged the possibility of rendering the Gambia an important commercial river. He stated that a trading steamer can ascend three hundred miles up the Gambia; that from that point a land-route of four hundred miles would bring the traders to the nearest bend of the Niger; that the last-named river would carry on the transport nearly to Timbuctu; and that the total distance from the Atlantic would be many hundred miles shorter than the present route *via* the Sahara. Mr Donald Mackenzie combated this view. He stated that the proposed route is beset by many mountains and still more swamps; and that the natives are a very quarrelsome race, on whom little reliance could be placed. English merchandise to the value of three millions sterling reaches Soudan annually; but he did not think that the Gambia was a desirable route for getting it there.

And so we come, step by step, to a consideration of the great Desert of Sahara itself. This enormously wide expanse is not all one burning surface of shifting sands; there are here and there fertile *oases* or green spots, precious to the wanderers over the Desert, who can here find fresh water and acceptable vegetation. Were it not for these verdant patches, the million inhabitants or so—Moors, Arabs, Berbers, and Negroes, in varied proportions—could not possibly find sustenance and shade. These oases define the caravan routes, which are so selected as to make use of them; and at several such spots many routes diverge in different directions. It is scarcely too much to say that the Sahara is known to Europeans only at and near its edges, and along some of the caravan routes; and it would be little less than courting death to attempt a passage except where oases and wells are known to exist at intervals.

The Sahara is not quite flat; and a knowledge of this fact has suggested two projects in recent years, one by a Frenchman, and another associated with the name of Mr Mackenzie. About three years ago, Captain Roudaire, of the French staff, while engaged on a survey in Algeria, was struck with the fact that the surface of the Desert near that country is many feet below the level of the waters in the Mediterranean. He thought it very probable that the sea at one time flowed over this depressed portion, that dunes or sand-hills have gradually formed a barrier along the present line of coast, and that the Sahara bay (for a bay it must have been, if this view is correct) became dried up by the evaporation of water which could no longer reach the inner sea. He introduced the subject to the notice of the French government, and also to the Academy of Sciences. Two years ago the National Assembly voted a grant of ten thousand francs to enable Roudaire to make a preliminary survey; with a view of ascertaining whether a channel can be cut across the sandy ridge of the coast, that would admit the waters of the Mediterranean to the basin or depressed portion of the Sahara. His estimate of cost to complete the work, if found practicable, is twenty million francs (eight hundred thousand pounds sterling). But some French savants having expressed a doubt whether the depression is so deep as Roudaire believes, and whether it can be reached in a convenient way by the proposed channel, the future must supply further evidence on these points before the French government will venture to invest largely in the matter.

Mr Donald Mackenzie, like Captain Roudaire, believes in a Sahara basin or depression; but not in the same locality. He pictures to himself a small Atlantic, not a small Mediterranean, flowing over a portion of the Desert. Taking a point on the north-west coast of Africa, nearly opposite the Canary Islands, he believes (from a comparison of levels) that an inland sea once existed, joining the Atlantic at the present mouth of the river Belta, and extending south-eastward to within fifty miles of Timbuctu. The direct distance is about eight hundred miles, being less than half the present caravan route to that city from the Mediterranean ports. This region was carefully examined by Dr Barth. He found by numerous levellings that it is a great natural basin or depression—a fact with which the native Arabs seem to be familiar; for their names for

the region are *El Tirs* and *El Jâf*, terms which expressively denote a shallow or great hollow. In this depression are to be found Atlantic shells, pebbles, and flints, scattered more or less over a hundred and twenty square miles of land; and the surface, moreover, is in many parts incrustated with sea-salt. A sand-bar, at the mouth of the river Belta, is supposed by Barth to be the only real barrier between the depressed basin and the Atlantic. The basin itself, with its oceanic vestiges strewn broadcast over the surface, is diversified by very little life, either animal or vegetable; but there are broad belts of higher ground around it that possess the wherewithal for fertile spots and populous villages, these belts for the most part separating the basin from the higher and more sandy parts of the Sahara. Barth and Rene Caillié enumerate nearly thirty towns and villages along the bordering belts of this depression, between the Atlantic coast and the city of Timbuctu. With a list of these names we need not trouble the reader; they would somewhat tax his powers of pronunciation.

Supposing this depressed portion of the Sahara could be again filled with Atlantic water (as the best authorities believe it once to have been), it might be the means of bringing the vast region of Soudan, with its millions of inhabitants, within reach of English trading vessels. We will gladly buy their cotton, indigo, grain, palm and nut oil, gums, resins, coffee, ivory, &c.; and as gladly sell them our metal goods, textile manufactures, earthenware, glass, leather, and so forth. If we could approach so near to Timbuctu by water conveyance as fifty or even a hundred miles, we should get rid of something like fifteen hundred miles of caravan travel, with all its attendant dangers and delays. Barth estimates the depression, in its deepest part, at little less than two hundred feet below the level of the Atlantic. At present, the streams from the higher land around form extensive marshes in the rainy season; but this water does not and cannot reach the Atlantic, on account of the intervening belt of sea-shore. The view now taken is, that if the entrance of the river Belta were cleared of sand, the salt waters of the ocean could again enter as of yore, and fill up the depression of which the bed of that river forms part. If the levels have been taken with even approximate correctness, and if a deep channel could be cut across the sand-dunes of the sea-shore, there would (it is assumed) be nothing to prevent a merchant-vessel from steaming from London to within fifty miles or so of Timbuctu. Breakwaters at the entrance of the channel would be required (as at Port Said at the Mediterranean entrance of the Suez Canal) to keep the sand from being drifted into it; but this comes within the range of ordinary engineering. The drainage from the higher land around the depression, instead of evaporating from marshes as at present, would possibly form an outflow current, tending to scour the channel of communication with the Atlantic.

At a Mansion-house meeting held last year, and in an interview with the Secretary of State for the Colonies, Mr Donald Mackenzie fully explained his plans. He proposes, first, to survey that part of the Atlantic coast, with a view to the selection of a suitable spot for a harbour; then, to enter into commercial arrangements with the traders on

the Barbary border of the Sahara; next, to win the good-will of the Sahara tribes, along the route which the proposed navigation would take; and lastly, to ascertain whether the Atlantic waters would really convert the depressed basin into a sufficiently deep inland sea, supposing the coastline to be properly pierced with a canal or channel entrance. It is almost certain that, irrespective of commercial navigation, such an expanse of seawater, subject to tides and currents from the Atlantic, and to the cleansing influence of freshwater streams from the higher ground around, would cause occasional rains to fall on regions now parched; thereby improving the climate and productions of the Sahara. After all, this depressed basin occupies less than one-twentieth part of the Great Desert in its totality; consequently the enterprise is not quite so extravagant as it might at first sight appear. The English government have directed our consuls in those regions to render such aid as may be in their power; and a subscribed fund has placed in Mr Mackenzie's hands the means of commencing, at any rate, his exploratory journeys and surveys.

We can do as we like about indulging in magnificent dreams concerning the future of this undertaking. If any one finds pleasure in so doing, let him imagine our walls plastered some day with announcements of 'Cook's Tourist Tickets to the Great Desert of Sahara; including hotel coupons for the Royal Victoria, Timbuctu; conveyances to places of interest in the vicinity; and trips up and down the Niger.' But sober folk will content themselves with a belief in the fair probability of useful results from Mr Donald Mackenzie's remarkable enterprise.

DASHMARTON'S LEGACY.

CHAPTER VI.

THE market dinner at Friddenden was unusually well attended on the day of the sale of Mordien. Probably, however, few of its frequenters had any idea of buying the estate. Some were drawn there by curiosity, and some by a well-formulated idea that a good deal of gratuitous festivity would accompany the event.

A long lofty room is the scene of the banquet, with tall windows, looking over stables on one side, and a little rookery of cottages, malt-houses, and pig-sties on the other. It has seen its best days; its flooring is patched and uneven, and if you step on a loose board—and there are many—a *feu de joie* of dust marks your indiscretion. There is a rough platform at one end, used sometimes for entertainments, where all the spare and invalid chairs of the establishment are piled, and two or three tables that have evidently been in the wars. And yet the room is not without some evidences of former grandeur. There are two large fireplaces, with elaborately ornamented chimney-pieces; and over one of these looms in neglected grandeur the portrait of Sir Thomas Grigsby, M.P., 'for many years'—as a tarnished brazen tablet informs one—'chairman of this bench of sessions.' Here and there too, fragmentary sconces, with bits of glass lustres hanging about them, stick out from the wall, in a sort of melancholy remembrance of the days when bright eyes brightened in their light, and the

swift footsteps of the dancers made a merry chime among their sparkling drops. They have all danced away to Hades now, all those gay souls of Friddenden, and nothing but beef and pudding remain—steaming rounds of salt beef, sirloins well streaked with yellow fat, legs of mutton that the gravy oozes out of in rich cascades, vegetable dishes everywhere, and half a hundred hungry farmers waiting to fall to.

The chairman—he is a permanent chairman, mark you, and on confidential terms with the landlord—is a gentleman with a bald head; the effect of which is intensified by a bushy beard, a bulbous nose, red bloodshot eyes, and a voice hoarse and vinous. He closes the red eyes tightly and piously for three seconds; you hear an uncertain sound through the bulbous nose: grace has been said, and the farmers are let loose on their prey. Such a clatter of knives and forks and jangle of plates; whilst mine host, hot and anxious, rushes to and fro, and the odd men who act as waiters tumble over each other in their eager haste. A while ago you might have ascribed the aspect of our president to a too free indulgence in the pleasures of the table. Now, you see your mistake. He is a martyr to market dinners. Save for an occasional splash of gravy that lights on his beard, he is fasting like any anchorite. His is the fate of Tantalus: surrounded by good things, he is unable to touch anything himself. Even before the first plates have been filled, the second helps are coming down upon him. He toils away at the carving-knife like a slave at the oar. But in the thick of the battle, he still has thought and presence of mind. He casts an eagle glance round the table; he whispers to his *aide-de-camp* the landlord; forthwith a corps of sherry decanters debouch upon the field of battle. Then to the clatter and din already reigning, are added wild cries from the combatants. 'Simmonds, a glass of wine.' 'Brown, with you.' 'Punnet, I'm looking at you.' 'Smith, the decanter.' 'Charles, the pleasure!' 'Tomkins, pass the sherry.'

It is not the etiquette at our market dinner to take a glass of wine quietly to yourself. If you fail to find a gossip to take wine with, you may fail also to taste our host's well-fortified sherry. Your only plan, if a stranger, is to cry out lustily with the rest: 'Brown, a glass of wine with you.' Some good-hearted Brown is sure to respond, and stop the flying decanters till you are served with the ambrosial fluid; after which—such the vanity of human wishes—you will probably regret that you did not leave it alone.

The clatter and the tumult subside after a while, and the sobering influence of a soup-plate carried round to collect the fees for the dinner makes itself felt. But at this moment the chairman rises, and after tapping the table loudly with his hammer for silence, announces in his most sonorous tones, that 'Mr Bowen will put half a dozen of champagne on the table; an announcement which everybody cheers vociferously.

Mr Bowen is the auctioneer, of the firm of Bowen and Pass, from Meddenham, a gray-haired man with ruddy, healthy face, who, now that the dinner is over, seems to start all of a sudden into distinctness and importance. He scans with a critical observant eye the company about him. There is no one here probably who will give him a *bond-fide* bid for Mordien, nevertheless they are

nearly all worth conciliating; sales of live and dead stock, valuations, appraisements—all these things may sooner or later come to pass among Mr Bowen's half-hundred friends. As soon as the champagne has passed, and everybody has drunk his health, he makes a friendly progress round the room, chatting pleasantly, with a word in season for everybody. Presently he comes to Alfred Harvey, who has been sitting all the while with a quiet moody face, paying little attention to what has gone on around him.

Alfred Harvey is in that queer moonstruck condition, one hardly knows whether to call it happy or unhappy, when all the good things of life, all the pleasures that have pleased, and the pursuits that have captivated, seem as nothing in comparison with the interest that hovers about one particular being. Alfred has responded to the challenges of his friends in mere sips of sherry; he has hardly touched the champagne. How much better he would have relished a cup of tea at the hands of Lucy! The flushed faces of the people about him seemed satyr-like in their gaiety and grossness, and assuredly the jokes and stories that circulated went well to match the faces. Time was that he would have laughed too, as heartily as any one, at the passing jest, but now it would have seemed a sacrilege almost.

'Why, you're looking very glum, Master Alfred,' said Bowen, patting him on the shoulder, and taking a vacant chair beside him. 'Come, come; if she isn't kind to you, you mustn't take it to heart so. Let us have a glass of champagne together.'

This proposition Alfred refused rather sulkily; and Bowen, seeing that any 'chaff' would not be kindly taken, began to talk business.

'I rather thought we might see your father over here,' he began.

'Father's laid up, but he sent me in his place.'

'Glad to hear it, Master Alfred; we shall have some brisk work then. It's a nice place this Mordieu, a very nice place. I should like to see you in it very much. I should have a chance then perhaps of a glass of wine in the old house again. Ah, what a hospitable place it was in poor John's time! If the Chilprune people buy it, I hear they mean to pull the house down and tack the land on to Slugget's farm.'

'Perhaps they won't get it,' said Alfred.

'Hope not,' whispered Bowen; 'but you'll have to put a bold face on it. Show 'em you mean to have it from the first.'

'That I certainly will,' said Alfred.

Long clay-pipes were now in the mouths of all the smokers of the assemblage, and they formed an overwhelming majority, and 'grogs' were coming in thick and fast. Presently the chairman vacated his seat at the head of the table, which was taken by Bowen the auctioneer, who began to turn over his papers and jot down memoranda here and there. Now the doors were opened to the general public, who filed in in considerable numbers, and took their seats on benches all round the room. Few of them looked like people who were prepared to invest much in landed property, but Bowen knew them every one, and nodded amicable greetings all around. Perhaps, indeed, there were some well-lined purses under even those patched smock-frocks.

'Gentlemen,' said Bowen with a preliminary

cough, and tapping lightly on the table, to call attention, 'I hope you will order in whatever you wish. The waiter is going round, gentlemen.'

A low murmur of approval followed this announcement. Soon after, the more important actors in the scene began to make their appearance. First of all, Mr Dolland the mortgagee hobbled into the room. A thin wizened old man he, coughing violently at the atmosphere of tobacco-smoke, with a pair of polished black crutches, which he reared carefully against his chair, but which came rattling down once or twice before he could arrange them safely. Almost on his heels came the lawyer with his red bag full of papers, then Mr Whitwick, and two or three squires, who didn't mean to buy, but might have to sell by-and-by. They all took their seats near the auctioneer. Then there was a long pause, broken by Mr Bowen, who requested silence whilst the conditions of sale were read out. Another pause, during which Mr Dolland seemed to be telegraphing to the auctioneer to go on. But Bowen still was silent; and then the door opened once more, and Mr Elkins entered with Lord Tancanville.

The old lord seemed to find the tobacco-smoke a little too much for him, but politely waved an intimation to the public that he didn't mind it at all—rather liked it, in fact. The landlord hustled out to get his lordship an arm-chair; but soon every one was settled, and the serious business of the day began.

Descanting very briefly on the advantages of the property he had to offer for sale, Bowen at length asked for a bid. Five thousand was volunteered by a gentleman in a smock-frock, after which, in a few minutes, and without a check, the biddings reached ten thousand pounds. That, it was well known, was Dolland's bid—just the amount of the mortgage—and for that he hoped to secure the bargain. Here the biddings hung fire for some time. Elkins had made the last offer before Dolland's, and Elkins made no sign, but sat rubbing his chin with his hand in a thoughtful kind of way. Harvey, too, responded nothing to the glance of the auctioneer. Dolland's pale face took quite a hectic gleam as he waited with suppressed excitement the probable fall of the hammer.

'Ten thousand pounds, going at ten thousand pounds,' cried Bowen with uplifted hammer—'going'—

'Ten fifty,' interposed the quiet voice of Elkins; and quick as the thunder after the swift forked lightning Alfred's voice was heard: 'Eleven thousand.' Elkins turned round sharply towards Alfred, then leant over to Lord Tancanville, and exchanged some whispered confidences.

'Eleven fifty,' said Elkins snavely, having caught the auctioneer's eye. Alfred rose another five hundred, to which Elkins added the minimum fifty. The Chilprune people were evidently determined to have the property, but at as low a cost as possible.

The contest now had become interesting, and the chances of the competitors were discussed with eager suppressed excitement. It was a marvellous thing that a tenant should beard his landlord in that way, offering hundreds where the former offered fifties; but it was a pleasant sight too, and all the sympathies of the farmers were with one of their own order. At this stage a friend crept quietly up behind Alfred and whispered in his

ear: 'Don't go too high. Remember, the Chilprunes lose nothing, however high it goes; all the surplus will come back to them.'

Alfred started and bit his lip, annoyed that he had not seen that before. Of course all the money that the property realised above the mortgage would go to the estate of the late John Dashmorton—that is to say, to the Chilprunes, to make up his deficiency. Hence he was fighting an unequal contest. They might run up the property to twenty thousand pounds without being a penny the worse. His first impulse was to retire from the field and let the property go; but next moment a new idea struck him. The Chilprunes would evidently have the estate. But if he could run it up against them till the purchase-money would cover John Dashmorton's defalcations—what joy it would be to hand over to Lucy a full discharge of her father's liabilities! What a load it would take from her mind—what a claim he would have upon her gratitude! The slur removed from her father's name; herself set free from all the innuendoes and evil reports that were current. That receipt in full would be an answer to anything. Yes, it would be a grand thing to do, and he would do it. So he boldly sang out: 'Thirteen thousand,' and abided the result.

The Chilprune representatives seemed annoyed, and after another whispered consultation, assumed a bolder policy. They bid at once to fourteen thousand, as if to shew their opponent that it was useless to contend with them; but Alfred countered them quickly with another five hundred, and Elkins angrily offered fifteen thousand. After that, in breathless silence the biddings continued, in thousands, Alfred Harvey's being the last offer—twenty thousand pounds. Elkins threw himself back in his chair with an impatient gesture. Lord Tancarville shrugged his shoulders and took a pinch of snuff. Alfred sat there in a cold sweat with anxiety. If this property were knocked down to him now, he had flung away at least seven thousand pounds of his father's money for a mere Quixotic impulse. What would the old man say? What kind of a reception would he get at home?

Even the auctioneer seemed to think that enough had been offered for the property, and the hammer was descending after a brief delay, when Elkins made a final effort and offered twenty thousand and fifty pounds. Alfred gave a long sigh of relief and hid his face in his hands, to conceal the joyous rush of feelings that shewed themselves in his countenance. After throwing appealing glances in vain at Alfred, Bowen knocked down the property to the trustees of the Chilprune estate; and the assemblage resolved itself into its original elements with a mighty buzz. Alfred stole away, and drove home as fast as he could. He was mightily anxious to be the first to tell the good news to Lucy: that she was now clear of the Chilprune trustees, and might snap her fingers in their united faces; that there would be a few hundreds over, no doubt, for John Dashmorton's heirs; and that her father's memory would be cleared from the blight that had rested upon it. But he was fastidious now; he would not present himself in these garments, saturated with tobacco-smoke. He would present himself in spotless attire, like a bridegroom, for who could tell what might be the reward he should get for his good tidings?

Perhaps a hero of romance might have hesitated to claim at the hands of the lady of his heart any reward for such a service as Harvey had performed for the Dashmortons. Such a one might have rather concealed the fact, and made out that somebody else had done it, fearing lest he might unduly move her in the direction of gratitude, rather than of that disinterested love which it is his hope to inspire, and place her under a burdensome obligation, which may give him an unfair advantage over the other competitors. But Alfred Harvey had no feelings of that kind. As long as Lucy was prepared to accept him as her husband to be, he was not likely to speculate as to whether she took him for himself alone, out of gratitude, or even with a prudent eye to those future advantages which his prospects might offer. The result was the thing. Now he had risked a considerable sum of money—his father's indeed; but still the loss would have been his own eventually—in securing a great benefit to the Dashmortons. No; he was not going to put his candle under a bushel basket—a course which, as we heard an eloquent expounder once declare, would end in burning the basket's bottom out—he would rather be the first to carry the good news, and he would not be unduly reticent about his own share of the business.

Alfred, however, still carried a careful mind, notwithstanding the disturbing influence of passion; and before leaving his home, in his best attire, and cleansed from all the contaminating odours of tobacco, he proceeded to lock up the roll of Bank of England notes which he had taken with him to the sale. On counting them over, however, there appeared, to his chagrin, to be a deficiency of one note of a hundred pounds; he counted only nine instead of ten.

He had not counted them since leaving the bank, and it was just possible, when he had transferred them from one pocket to the other at the half-way house between Meldeham and Friddenden, that he had left one note behind in his great-coat pocket. He felt carefully in every corner of the pocket, and then his hand came in contact with the cover that had once been upon Lucy's book. He felt something crackle crisply within, and drew it forth in triumph—his lost note, which had no doubt become entangled in the cover. But when he turned over the cover, he found that the note—for undoubtedly there was one—had worked itself within the sewing; and without another moment's consideration he tore away the stitches that held it, and drew forth a Bank of England note. He was about to add it to his roll, when the figures upon it attracted his attention. 'I promise to pay five hundred pounds on demand,' he muttered to himself. 'There is a fine thing. The bank has made a nice mistake.' Then he went over his notes again: he had counted them clumsily before; but this time going over them one by one he found that he had his full tale—ten notes of a hundred pounds, and this other note was a surplus one. To whom did it belong? Not to him, certainly.

Then he examined the book-cover again, and saw that it was impossible that a note could have worked into the carefully contrived receptacle in which he had found it. Who had placed it there? In all likelihood the owner of the book—that is to say, Lucy Dashmorton.

Alfred sat down, feeling quite faint and sick at heart. He drew out his pocket-book again with

trembling fingers, and found the slip he had cut from the newspaper containing the advertisement of the inquiry for the five hundred pound note, with its description and number. Yes; it was the identical note!

And they had been right, then, after all, his father, Elkins, and the rest. She had some secret hoard then, and was a participator in her father's dishonesty. 'And yet I could have forgiven her,' groaned Alfred, 'if she had owned to it when I asked her.' But duplicity, unblushing duplicity, falsehood, dishonesty, was it possible such things should exist in a creature thus fair and engaging? Why, yes; he was only going through a phase of the universal experience.

There was just one loophole. Lucy herself might not have been cognisant of the existence of this; Spiller might have hidden the note. Harvey held but a light opinion of Spiller, and such an action on his part would not have surprised him. And yet when he came to think of Lucy's anxiety—foolish anxiety he thought it at the time—about her book-cover, he felt that this hope was a slight one.

His course was soon determined on. He pinned the advertisement to the note, placed both in an envelope and put them in his pocket. There was only one question he would have to ask of Lucy: 'Did you know that this note was hidden in your book-cover?' If she denied it, well and good. Spiller must be brought to acknowledge that he was the culprit. If not, then he must abandon all thought of Lucy Dashmarton. He could never marry a girl who was dishonest and untruthful.

Alfred found his way to the cottage just about tea-time. Spiller had come in, but was not at that moment visible. The tea-tray was in the little parlour, and Lucy was sitting by the fire in the twilight, enjoying the relaxation known as the 'blindman's holiday.' It was with an air of glad welcome that she sprang up and advanced to meet her lover. A rumour of what had happened had reached her through Spiller. He did not know the exact figures, but he had heard that Morlicu had sold for nearly double its value, owing to Alfred Harvey's determined stand.

'Is it really true, Alfred,' she asked breathlessly, 'that Morlicu has fetched so much money?'

'Yes,' said Alfred coldly; 'it is true enough. It sold for twenty thousand and fifty pounds.'

'And how does that affect us and poor papa's affairs?'

'All your father's liabilities will be paid off, and you will be entitled to a full discharge for everything. There will be a surplus, too, probably of four or five hundred pounds, after paying all expenses, to divide between you.'

'And we owe all this to you?' said Lucy, blushing deeply. 'Can we ever thank you enough?' She held out both her hands to him. He had only to seize them, to draw her to him, to claim her as his own. She was his, he felt, at that moment—she was his. But he would not see the hands held out to him.

'Stay!' he said; 'there is one thing I have to give you, and then my duties are at an end. Look at this, Lucy, and see if you know anything about it.' Alfred went to the window and looked disconsolately out into the gathering gloom, whilst the girl knelt before the fire and examined the contents of the envelope by its light. There was

perfect stillness in the room for some time, and then Alfred turned impatiently round and looked at Lucy. She had sunk back a little from the fire, and held the note in front of her at arm's-length pressed against her knees.

'Well, Lucy,' he said in a trembling husky voice, 'do you know where I found that?'

'Yes; I know where you found it.'

'And do you remember what you told me when I asked you that question about money in this very room last night?'

'Yes; I remember.'

'Have you anything to say about it; any explanation to give?'

'No; I have nothing to say.'

'O Lucy, I'd have staked my life upon you; I gave my own father the lie, when he hinted you were dishonest; and now—'

'And now you know me better. Alfred, why do you judge me so harshly?'

'I don't judge you, God knows,' said Alfred in a broken voice; 'I love you too much; but I can't get over that. Lucy, can't you say something to explain it?'

Lucy shook her head. 'I have nothing to say.'

'Then I must leave you, Lucy; I must leave you.'

'I am quite content,' said Lucy; but a sob in her throat belied the words she uttered. 'It is better that you should go now. Farewell.'

Alfred stole softly out of the room, opened the front door gently, and went out. Lucy listened to his departing foot-steps till their sound died away in the distance, and then gave way to a flood of bitter tears.

Nothing more did she see or hear of Alfred Harvey for a long time, and then news came that he had given up his farm and was going abroad, either to North America or Australia; which of the two did not seem to be very clearly understood.

ON THE BLACKWATER.

BY WILDFOWLER.

Two or three years ago, in the beginning of August, I was delightfully surprised, one fine morning, at receiving the following epistle:

'Mr Wildfowler, sir, the mullit is on, i have cot a good aul on em. please cum; sir, lots ov burds in the mashes. I am at Haybridge. Dick.'

This was a letter from an athletic fellow, fisherman and wildfowl shooter, with whom I had, in previous seasons, gone several trips, fishing and wildfowl shooting. He had served me well; had always shewed me sport; had rescued me from a muddy bath once or twice on the Blackwater; was a civil, honest man, passionately fond of his work, and perfectly mad for sport; so we two jogged along together comfortably, and we had always remained in pretty permanent communication. My yarting words, on the previous March, after our last duck-shooting sail in the estuary, had been as follows: 'Dick, whenever fish turn up, drop me a line. And anyhow, under any circumstances, remain assured that I will come down here for a week's popping at the oxbirds in August.' I telegraphed him that I was packing up; and in the evening, a fly from Maldon Station deposited me safe and sound, with guns and lines and luggage, at the door of the Heybridge Inn. At the noise of

the wheels, Dick, who was on the 'hard' baling out his little boat which he termed the dinghey, called out a hearty greeting, and came up ponderously crunching the pebbles on the 'hard' under the thick heels of his mighty sea-boots. I can never look at the worthy fellow's face without feeling happy and comfortable; for his presence alone brings back to my memory many dearly treasured incidents of sport, and the very air around him breathes of freedom and of enjoyment. We generally connect men and things with the pursuit in which they are usually engaged; and hence, when my worthy wildfowl shooter stands before me, I always slay, in anticipation, perfect hecatombs of ducks, teal, widgeons, curlews, &c. We shook hands heartily; we always do. I like to, Dick likes it; and the men around feel honoured, collectively, by it, and are all ready to oblige me, and to lend us a hand whenever it is needed. Few men are more sensitive to good treatment than those independent fishermen and shooters, and I will warrant that the men would risk their necks, ay ten times over, to help any one to whom they once have taken a fancy. But let the 'hard' once be desecrated by the presence of some stuck-up man, who thinks that money is *par excellence* the thing and the only thing that will move men, then you will find that that man gets served for his money and nothing beyond. There will be none of that earnestness which gives such a zest to the sport. The fishermen will do their duty, take him fishing or shooting as they may have agreed to, but they will not exhibit that spontaneity and that desire to please which are their charming characteristics when their hearts are with the man who employs them. I am proud to say that I have frequently experienced instances of their good-will, and that I can never forget or repay the many kindnesses I have met at the hands of these hardy men. Well, Dick is as fair a sample of the *genus* as could be found in a very long cruise round the coast, and with him I feel happy, jolly, and full of pleasurable anticipations.

'Now,' said I to him, when our first warm greetings were over, 'as we were bound to lay in a stock of provisions, for I mean to stop three days, I have brought a hamper full of good things from town.'

Now, honest Dick, like most honest men, is rather fond of a good thing; and the way he smacked his lips when he shouldered the heavy hamper, made his friends and acquaintances laugh all round. Forthwith, two or three men took my gun-box, carpet-bag, game-bag, &c., and we all went down to the shore. Dick took the sculls, gave us a preliminary shove, and we were off.

I had rarely seen the Blackwater in a quieter and more lovely mood. The summer sun shone on our devoted heads as though it meant melting us altogether; there was hardly a ripple over the water; and the landscape around us looked lovely in the extreme. Of course, in our immediate neighbourhood were the mud-flats, shewing themselves broadly on account of the ebb having left them bare; but, nevertheless, Heybridge, with its few red-tiled houses, its few ships unloading in the basin, its white punts drawn up high and dry on the beach, together with some small snacks 'listing' on the mud, made altogether a very pretty picture.

As soon as we were under weigh, I placed the gun-box on the seat by my side, unlocked it, took out my double gun, placed twenty rounds of ammunition in my pockets, and then I went forward, facing the bows, and looked out for birds, hundreds of which were evidently about, as we could hear them as plain as could be whistling on every side. Moreover, evening-time is the best for that sort of sport, because the shore-birds turn out in strength, and thousands are to be seen then feeding on the flats. My first shot was a lovely miss, but with the second barrel I scored. Dick, who had stopped rowing when I had touched him (our usual signal), then gave two or three pulls towards the dead bird, and we picked it up. It was a redshank, in splendid condition, as well he might be, for the bird had, as yet, experienced anything but hard weather; and if plenty of food, a bright sun, and a 'Wild Bird Protection Act' cannot allow a bird to lay on fat, then all I can say is, nothing will. A little farther on, I saw a bunch of some twenty shanks and other shore-birds wheeling about over the water. I touched again my oarsman, who quietly kept the sculls ready for action, and meanwhile turned his head to have a look, too. Just as I was covering the leader, and was going to fire, 'Look out, sir!' called out Dick; and casting up a glance skywards, I immediately beheld a mullard, going at the rate of sixty odd miles an hour, just crossing our stern. I fire; miss; fire again, and stop my bird by a green cartridge.

'That is better than shooting a redshank or two,' quoth Dick, when he picked it up, and smoothing its feathers, finally placed the bird astern under the seat. 'I just caught a glimpse of him as he was passing over us,' he went on. 'Lucky you could turn in time. And now, sir, here is the smack. We will go aboard, put your things there, have something to eat; then we will go for another row, or a sail, just as you prefer.'

So saying, we bumped against the port-side of the stout little craft that was to take us to our fishing-ground. Dick's younger brother, John, turned up to lend us a hand; and in due course I found myself below, seated before a regal 'spread,' the service being well attended to by the two men, who are rare good hands at cooking fish and birds, and at pulling corks out of bottles. It was about eight o'clock when we reappeared on deck, and the tide was coming up fast then. There was no fishing possible, at least with the nets, as it would be dark soon. We could certainly have indulged in a little hand-line fishing, had we been so inclined, but we were not; and as the birds began their evening flights, we concluded that it was time to start, if ever we meant to. Re-entering the dinghey, each man took an oar, and we started for a large creek on our starboard-side. The sun was going down Maldonway, and its rays were very dazzling when we faced the west on entering the creek, nevertheless I contrived to make a nice mixed 'bag,' a portion of which our junior undertook to pluck on our return, for our supper.

When we came back to the smack, we set sail for the place where the men intended to put down their nets in the morning, and fortunately no other fishermen had turned up to try the spot. This made the two brothers as pleased as Punch; and we all turned in, at half-past eleven P.M., the

men forward, and I alone in the cabin. The night was quiet and mild until two or three o'clock in the morning, when a rattling breeze began to blow; but by daylight the wind went down again, and when we turned up on deck at six, the day promised to be as lovely as could be wished. We were all very busy. I was getting my shooting paraphernalia in order, ready for work; Dick was overlooking the stop-nets which were going to be used; and his brother, forward, was deep in the mysteries of his cooking. We had fish, flesh, and fowl for breakfast; and a more merry set than the three of us when we left the smack and rowed away in the dinghey, could hardly have been matched anywhere, let alone on the Blackwater itself. The skiff contained the nets, ready folded for dropping; and I watched my companions with lively interest when they prepared to drop them. Mullet, it must be borne in mind, are a queer set of fish, which occasionally will take bait, but as a very general rule, decline so to do, notwithstanding the many varieties of bait with which the 'hookers' may try to tempt them. This being so, the nets are resorted to; with what success the sequel will shew.

We got to the mouth of a creek, where my companions declared that the mullet always congregated; and we remained waiting by the shore where the first end of the net had been fixed until the tide was almost high. When the flats were all covered with the brine, then it was time to set the nets. Dick took up his position on the starboard; I went forward, to be out of the way of the men; John took up the sculls, and he rowed us right across the mouth of the creek; whilst his brother, during the transit, dropped and arranged the nets. This done, we had only to wait for low tide; but there being a quarter of a mile lower down, another likely creek, we went to the smack to get the second net, and rowed with it to the second creek, where it was expeditiously and cleverly laid. At one o'clock we went aboard for luncheon, and at two we went to see what catches the nets might have made. The ebb-tide had still two hours to run, but already the water was very low; and unmistakably we had fish, the water inside the net being in a perpetual turmoil from their efforts to escape.

'Them fish,' said Dick, 'is the rummest to deal with we ever comes across. They be like sheep, they be, them fish. If one of 'em finds out the way over the net and shews it to t'others, they all follows suit and bolts over; and *there!* sir, there be one going now!'

Rowing desperately towards the net our presence near it kept the mid-channel fish steady, but on both port and starboard sides, a few kept on leaping, and one to whose identity I could almost swear, jumped at least twenty times out of water, but fortunately missed the net. He was an enormous fellow, and very graceful withal, reminding me very forcibly of those elegant pictures in old angling books wherein the fishes hanging from the lines of the anglers are always depicted with their bodies in a semicircle. Altogether the sight of the 'catch' was a very attractive one, particularly so to the men, who were simply delighted, for mullet are nice fish, and a good catch of them is not by any means to be despised from an *L. & d.* point of view.

When the tide was low, my men proceeded to

load their fish; but as I got terribly splashed about, I voted to be landed, and gun in hand, went for a stroll after watching the fishermen a few minutes. The flat I then was on was moderately safe, but I did not like venturing too far; and thinking I might do something in a minor creek close by, I went there and bagged two birds with a rattling right and left. Then, to my great surprise, I saw a large mullet jumping out of a small pool of water in the channel of the little creek, now almost dry and bare. I went down with some difficulty, the mud being very slimy and slippery, and secured the fish and my birds, with which I retraced my footsteps. The net was then picked up, and the men had about three scores of mullet in the boat. Returning to the smack, we tumbled the lot, net and all, into the cockpit, there to be looked after at leisure on our return, and then we proceeded to draw the second net. Owing to the distance, the men had to make all speed, as otherwise the next tide would have bothered their operations. Indeed, as Dick expressed himself, 'they had drawn it rather fine, for ere the fish were all in, the flood began. Fortunately, the work was nearly done; and everything was satisfactorily taken up without any unlucky *contretemps* happening to mar the success of the undertaking. The catch there was about a score and a half.

We then returned on board, and at once set sail to Heybridge, where the men took the fish ashore in hampers and boxes; and the said hampers and boxes were forthwith despatched to Maldon railway station, *en route* for London. The next day we went again for another drop-netting operation; but we had poor sport. The third day, however, being somewhat rough at sea, drove the shoals well up the estuary, and the result was a gratifying haul at low tide. Thus I spent three pleasurable days on the Blackwater. In the intervals of netting the mullet, I busied myself at dab, plaice, and whiting hooking; or I went shore shooting. What with sailing and rowing about, an occasional shot with the net, and an occasional raid upon the wildfowl, I have rarely spent three more entertaining days anywhere; and when I left Heybridge for town, and Dick, with the concluding grip of his large horny honest hand, asked me his usual question: 'Enjoyed yourself, sir?' it was with heartfelt gratitude that I replied: 'Never better anywhere, Dick, thanks to yourself and your brother.' And thus we parted, mutually pleased with each other; and thus ended my August trip on the Blackwater.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.
- 3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.
- 4th. MS. should be written on one side of the leaf only.
- 5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

SATURDAY, AUGUST 12, 1876.

PRICE 1½d.

MONT BLANC WITHOUT A GUIDE.

FOR the following description of an ascent of Mont Blanc, *unassisted by a guide*, we are indebted to a Scotch clergyman, who performed the daring feat in 1873. During a solitary tour through Switzerland, he kept a diary, from which he has furnished us with the following extracts.

CHAMOUNI, August 21, 1873.—Went down to breakfast between seven and eight o'clock. The window of the room, which opened like a two-leaved door, was ajar, and invited me to the stone balcony outside overlooking the street. Standing there, and inhaling the *coller* air, driven down from its snowy haunts by a delightfully invigorating breeze, I thought that the time was favourable to go up and see what the mountain was like. The snow-sprinkled spires, though no bells rung in their breast to catch the ear, save when the avalanche came down, spoke to the eye as they lifted their heads into the azure, and said: 'Come up hither.' Taken with the aspect of the day, and a desire to acquaint one's self with primeval solitude on heights above the line of creature-life, I prepared to go. There was nothing special to prepare. My boots, with common iron tacks driven into the soles, had nothing else to help their grip. The only article of equipment peculiar to the kind of work before me was an Alpine stick with a shod of iron an inch long. Furnished with a waterproof, rolled up with a pair of socks inside, and slung in leather over the back, and provided with Swiss brown bread, with butter to soften its skin, and cheese to keep it in countenance, I started about nine o'clock. In going through the village a flask was bought. Having thrown the green cord attached to it round the neck, and placed the flask in rest in the one outer pocket, to balance the other, grown stout with the bread and cheese, I crossed the Arve; and after walking the level for a little, slanted up the hill-foot, now through the wood, and then through the open, till human habitations became scarce. Seeing, on the slope to the left, a lonely mower plying his scythe, I asked of him the way, to make doubly sure, as the path forked

there. Thereafter, the path zigzagged up the breast of the mountain under pine-shadow, shewing steep precipices to the right.

Between two and three hours' walking in this manner brought me to the chalet of Pierre Pointue, on a commanding platform above the pines, six thousand seven hundred and twenty-eight feet above the sea-level. Mules go this length, but no farther. Halting there a little, I got refreshing milk, bread-and-butter, and then proceeded. The distance from Pierre Pointue to the ice is reckoned another hour's walk. The path crosses the shadow of the Aiguille du Midi, and is somewhat rough, besides critical, if the foot is unsure, and the head liable to giddiness. The rock of that peak is short of the grain, and not unfrequently gives way, speeding down with awesome force and sound, causing the echoes to groan with fear as the fragments leap, some over the dizzy cliffs, and some into the fathomless crevasses of a frozen sea. At length the rocky path ends, and the ice-way begins. It may be stated in passing, that fourteen hours is the time allowed to ascend the mountain; seven to the Grands Mulets, and other seven to the summit. Four hours are allotted to reach the ice, and the other ten to traverse a region of frozen snow that forbids room for a blade of grass or a flower.

I am now at the door of Winter's temple. The same glacier that was crossed yesterday near its narrow end or tail, is now before me in union with another glacier—that of Tacoumay, with a breadth for crossing which to the Grands Mulets between two and three hours are allowed. I soon found myself on new ground, peculiarly uneven. For a few minutes' walk at the outset, the path was over masses of ice of all shapes and sizes, lying, as a Scotsman would say, *lapsalcerie*. Now you walk on a roof of ice, and then leap from its gable on to the roof of another ice-block over a lane of unmeasured depth. At this stage I came upon a party, six in number, if I remember aright—an Englishman and his wife with four guides. After a few minutes' conversation on the comparative merits of Swiss and Scottish scenery, I passed

on. The way became more billowy than it had been a short time before, and led over high ridges snow-covered. Sometimes the other side of the crevasse was considerably higher than the one from which the jump was taken; still it was not hard to do. I had just crossed one, and was climbing a steep slope of ice, with the left hand touching the frozen snow, and the Alpine stick in my right, when a shuffling noise was heard, and a string of men, seven or so, met me in the face. They had been to the Grands Mulets, and were now coming down in a row, with rope fastened from waist to waist. One or two, and especially the last man in the row, warned me, in language and gesture most emphatic, not to proceed. At length, coming to a huge block of ice on a snow-ridge, I sat down on my oilskin roller, and tried the bread-and-cheese, time about with milk from the flask. That wall of ice standing up and screening me somewhat from the glitter and heat of the sun, was as the shadow of a great rock. Leaving that nameless inn, I ere long came into rough ground, peculiarly uneven. It was then that the head of the Glacier de Tacconay was being crossed. That same glacier and the Glacier des Boissons are as one, high up on the way to the Grands Mulets; but lower down, their narrow ends separate, and run down the mountain's side each in its own groove. The rough character of the ground there seems caused by the fact that an incipient stream flows underneath in the hollow; while the plates of ice slant downwards to its bed, and break into confusion on the way. At one particular part I came to a ladder which does good service; with its foot resting on the near side of the chasm, and its head on the breast of ice looking down from the far side, it enables one to surmount with ease a barrier otherwise hard to get over. Thereafter, the path ascended in slopes covered with snow, gently curving to the left, till it brought me to a spur of rock on which a log-cabin stands. It is called the Grands Mulets. This spear-pointed rock rising high and abrupt, presents a barrier to the avalanches of ice and snow from the mountain-slope at the foot of which it stands.

On ascending the rock, I met three English tourists, who had got up some time before me. One of them was a lady. The guide gathered for them some rare flowers that grew in the seams of the rock. We scrambled up the rocks behind the cabin, and surveyed the scene. We saw a Frenchman and three guides who had been on the top, resuming their descent after a rest at the Grands Mulets. The party beside me soon followed. After some minutes' converse we paid our mutual adieus, and they began to descend. Then I went in to partake of the food which I had ordered on reaching the spot. This food was prepared by a woman who dwells there for three months of the year. She is the servant of Mr Couttel, who lives at Pierre Pointue, and acts as a guide.

As I was waiting for my meal, a second party of tourists came down from the summit; they were Englishmen, some three or four in number. After refreshment and a short rest, they also continued their downward path, and left me alone. But I was not long solitary, for the first party I fell in with after entering the ice-region came in. They spent the evening and night there, and descended next morning. The cabin is a wooden house, some ten feet broad, containing two rooms, with two single

beds in each, a kitchen, and a guides' room, all in line, backed by the spear-pointed rocks. This narrow house is fronted by a narrow path, on the outer edge of which a wooden railing protects people from falling over the cliff. A great part of the afternoon and evening was spent outside, looking upon the unwonted scene, which I believe the Englishman and his wife, as well as myself, enjoyed more by far than the night-watch that followed. Looking across the valley of Chamouni, one saw straight in front the clean-cut Mont Buet, the glacier behind it, and toward the right, the Aiguilles Rouges. These, and many mountains nameless here, shone in that hour of transfiguration, when the sun, just set, left his last light, like memory, to clothe with colours of ideal beauty a world that has passed out of his sight. There was little cloud to vary and enrich the sky; but the hues of light, pale-green, roseate, and blue, glimmering upon the mountain-tops across the darkened vale, gave them peculiar matchless beauty.

Before turning in for the night, I had an agreeable talk with two or three of the guides, who advised me rather strongly to take a guide to the top of the mountain, or eschew the ascent. Though not led by their counsel, I regarded it as given in all sincerity, and still remember with pleasure their willingness to inform me, though my unaccustomed ear could only take in scraps of information. At length, we retired for the night, intending to sleep, but did not. The cold and other special reasons kept the tourists awake. I rose at three o'clock, dressed in the dark quietly, and went into the kitchen for an early breakfast. After breakfast, seeing it was rather dark to go without a lantern, I went back, and lay on the bed awhile. Here I may state that the woman was very kind and attentive. She gave me the loan of a pair of leggings with *spats*, alias gaiters, to prevent the snow from entering by the boot-heads, as it had done the day before. With boots greased by one of the guides, *spats* and leggings to protect the lower limbs, my wallet replenished, and tea in the flask, I was well-nigh ready for the road. Our kindly female attendant, of her own accord, shewed me a bottle of cognac. I thought: 'I am an abstainer, and will not use a stimulant unless placed in circumstances requiring it. But who knows what may happen? If one should use up all his energy, the cognac may serve to screw him up for a last effort.' So I decided to take a small bottle containing about two glasses; though it turned out that I brought the bottle back to the Grands Mulets without having removed the cork. The necessity provided against did not arise, so the cognac was brought back untasted. The woman appeared to have faith in my return, for when I offered to pay, she said there was no occasion, as I would come back again. As there was a way down from the top to the other side of the mountain, she seemed to have faith in my honesty as well as good-luck. Yet that may be vain reasoning; and the conjecture, that she felt sure of my meeting with an impassable barrier not far off, which would send me back again, may not have been far from the truth. Setting out about five o'clock in the cool, calm morning air, I left the Grands Mulets and began my ascent. The frost had somewhat hardened the surface of the snow, which made the walking dry and light; and though a little steep, the way was easy for

the first twenty minutes—if the guess be correct, seeing that my time measurements were by the sun and by feeling, as my watch had lost its reckoning. Thereon I came to a spot where the ice-floor had fallen down a considerable depth from the main level of the slope, like one of those great gaps you come to in a peat-moss, caused by the digging of peats in that part. As the grass and heather of the moor rest upon the peat and feed it by their own decay, so the snow proper of Mont Blanc rests upon and feeds a body of snow-ice, which in many places will be hundreds of feet thick. So, in making the ascent, one encounters various ground—here pure snow above the ice, there snow half-converted into ice, and farther on the hard slippery ice. This body of snow, turned into ice, and covering the mountain like a coat of armour, is not without seam or rent. In its downward progress over the rough uneven sides of the hill, it rends into pieces, and reveals yawning fissures between the joints of the armour. The gap I now came to was one of these rents. The field I had traversed had broken away from the field above, and a fragment had fallen into the middle between the two. This gap presented a bold look to a solitary traveller. It was easy to leap across the first chasm on to the sunken fragment in the middle; but when once there, the point was how to get across the crevasse on the upper side of the fragment. The other side of this crevasse rose up some seven or eight feet perpendicular, while beyond and above the perpendicular was a steep slope. Steps were cut in the wall, the lowest being breast high. Lower than that they could not be made to any purpose, as the ice retreated inward the lower it went. Supposing the step cut, one could not stand on it, as the forward stoop of the wall above would prevent his standing straight, and cause him to fall backward. The point was, how to get on to and stand firm on the step already cut, which was breast high. With a race and leap, one might have lighted on the step; but with nothing to hold by, all being ice, he would have come down backwards, and fallen into the crevasse, from which egress would have been impossible. An axe would have been useful to haul one's self up by, for he could drive the sharp end into the ice-face, and with combined leap and draw, throw himself on the wall-brow. I stood doubtfully, looking right and left, to see if there was any way of compassing the gap, but saw no out-gate. At length I bethought myself of my only companion, an Alpine stick about five feet long, and furnished with a shod of iron an inch long. On the left side of the first step the wall projected somewhat. Into this projection the Alpine stick was driven till within six inches of the head. It stuck out like a peg, a little above and to the left of the first step, at a height of fully five feet. It was not fixed in such ice as forms on water, else it would not have gone through, but in a mass of solidified snow, hard on the outside, but easy to pierce after going through the first few inches. Having got the stick into the wall, I retreated several yards, and running forward, made a leap, at one and the same time catching the stick with my left hand, throwing the right hand as far as it could stretch on the head of the wall, and landing my feet on the step the moment after. I was glad to find myself there, though in a cramped position,

with the stick end, and left hand holding it, behind the left leg. Drawing the stick slowly out from behind my heels as it were, and renewing the steps above, I resumed my upward course. For a considerable time the way went up a series of stairs with a landing-place at the top of each in the form of a plain, which, when once crossed, led you to the foot of another steep slope, here soft, and there hard and slippery. Sometimes the path ran sidelong across a hill-face, where one is very apt to slip, and if he does, the crevasses below await him. Sometimes my foot slipped into a hole; and I had to be wary when crossing the point of junction between two gaping pits, for there the blocks of ice were not completely joined, but had the seam between them filled up with loose snow. After mounting several stairs, and crossing the plains or landing-places alternating with the same, I found myself in what is called the Grand Plateau. Once there, the way to the top can be taken either to the right hand or to the left. The way to the right is much easier than the other, and, it is said, takes less time to accomplish. One thing is against it, in its being exposed to avalanches, which have on various occasions dealt destruction. There are three kinds of avalanches—the rock, the snow, and the ice. As to the last two, the one is a snow-slip, which is easily caused. A good depth of new snow lies upon a bed of ice on a steep slope; it has a slight hold upon the hill, with a crisp, thin frost upon its face; and a small thing will make it slip, and rush down as the snow from a house-roof. A party move along in single file across the snow-slope, the track which they make cuts away the snow-field above from the support which that beneath gave it, and down the snow comes with hissing surge; a swift and resistless river sweeping the unwary into the ice-pits beneath. One or two, it may be, hearing the coming sound, dig Alpine stick or axe into the frozen snow or ice beneath, and fall flat, holding firm their grip till the snow-slip has passed over them.

The ice avalanche is the breaking away of icebergs from their home on the face of the crags. Looking up to the right, one sees great quarry-faces of ice from twenty to fifty feet thick and more. These ever and anon, and chiefly in the summer months, loosen and come thundering down, strewing boulders of ice on the plain, and bestudding the path, like the stone boulders of Arran on the shore-road between Corry and Samnax; or the Fallen Rocks whose race to the sea Bute heard fifty years ago. The path to the right was exposed to these avalanches. The path to the left is much more arduous, being far steeper, more slippery, and in some respects more perilous, but is not exposed to avalanches. The great danger is that one is apt to become an avalanche himself, great enough for his own undoing. On consideration, I chose to ascend by this left-hand way, with the intention of coming down the other path. I thought by so doing, to make more sure of my way to the top, that being the route chalked out when the peak was seen in the distance. Though visible at Chamoouni and Pierre Pointue, the summit of Mont Blanc is obscured to the sight by intermediate heights, as the traveller comes to close quarters. After a good spell of snow-walking on the plain, I came to the foot of a very steep ice-slope, which may be what is called the Corridor. On my right were the Roches

Rouges—Red Rocks—and on the left torn ridges of ice. One has to find his way between these two, and veering to the right, climb over the flank on to the back of the ridge terminated by the Red Rocks.

The ascent of the Corridor required some care, as it was uncommonly steep and slippery, besides being guarded by yawning chasms. I had to go up with *canny* care, chipping out footholds with the stick shod. This had to be done in other parts lower down also; but here more work of the kind was required. As the body of the mountain was between me and the sun, I was well in shade. When well up the Corridor, the breeze came sweeping down with snow-drift before its besom. It was a cold bracing shower of small snow that effaced the footprints, and left one to be guided by the general bearing of the mountain. A storm coming upon the traveller in such a place might easily carry him off his feet, or if he found shelter on the lee-side of a block of ice, might freeze him with its cold breath.

Curving round to the right, and climbing the flank, which was somewhat stiff, I began to feel a little tired. It was now about eleven o'clock, judging by the sun, and up to this point I had seldom rested, only for a minute or two upon my staff, while taking a sip of tea. But the sun bearing straight down, and kindling all around into an excess of light, together with the rarefied air, combined to give a slight sense of fatigue and oppression. Yet, this was not without compensation when I got upon the back of the ridge, and saw before me the summit of Mont Blanc. If you fancy Mont Blanc a horse, my position then was on its hind-quarters behind the saddle. Walking along the back, I came to the shoulder, at the base of the neck. Thereabout, two or three rocks jut out, called the *Petits Mulets*, but they afforded poor shelter from the sun, that kindled the mountain with sparkling silver. There I ate a little, though I was more keenly sensible of thirst than hunger. The tea in the flask was nearly done, and to economise it, I occasionally moistened my lips with snow.

It is here proper to state, that from the time the summit came in sight, a view of peculiar grandeur met the eye in the aspect of the neighbouring mountains with glaciers on their breasts, and seas of ice filling up the valleys. But clouds of mist, at first like a man's hand, rose up from the icy dells thin and fleecy, and grew like veils woven by invisible fingers. The mountain was silent; and no sign of life came across my path, save the footprints of the chamois, and the sight of a party of three who had made the ascent of Mont Blanc from Courmayeur, on the Italian side. When I first saw them, they were making their descent toward Chanouin the other way from that by which I ascended—so we did not meet. I found the last stair, the side of the *colotte*, not least in steepness. The snow had a hard, slippery crust, which was apt to betray the foot. I rested once or twice, finding the snow a good sofa, my weariness being caused in part by the thinness of the air, which gives you at one inspiration only half of what you get on the plain. When not many yards from the top, and not so careful, perhaps, as I would have been, had crevasses been near to wait upon my fall, a foot slipped, and down I came. I was carried down in a sitting posture at an increasing rate, till, after

sliding some yards, I stopped myself by driving the Alpine stick well down into the hard snow. Then getting up, a little sorry to go over that dear space again, yet glad to rise up with whole bones, I resumed my way with more care and vigour, and did not rest till my feet stood on the summit of Mont Blanc.

For about fifty yards in length the top is nearly level. I walked along the ridge as on the top of a great dike, with a comb of snow upon it, and sat down upon the highest part. Besides the footprints, no signs of man were there, except a few bottles, some standing on their ends, and some on their heads. I suppose that, having spent their liquid treasure, they became the keepers of notes, recording the ascent of those who left them there.

Sitting on that comb of snow, I felt the cold for the first time, as the wind drove up from the Italian side, *snell* and freezing. Down in the valley on the Italian side was seen Courmayeur. Beyond it, a good way off, the Matterhorn raised its pyramid of bare rock far into the sky; while to its left, and at a greater distance, Monte Rosa appeared in majesty and power; the second highest mountain in Europe. Directly south, no far view revealed itself; a cloud came up from Italy with brooding wings, and swiftly bridged the spaces between the mountain-tops. The little plaids of mist seen an hour before this, had risen up from their individual glens, and uniting above the peaks, blotted out the landscape from view. Guessing what was coming, I began, after ten minutes' survey, to descend from the summit. Had I been half an hour later, or even less, in reaching the summit, perhaps no one would have believed my tale but myself. Even as it is, some people say that it is simply impossible to make the ascent of Mont Blanc alone, and that, consequently, I must have mistaken some lower height for the top. But seeing is believing. Both from Chanouin and Pierre Pointue, the top of the mountain is visible, and from both places *I was seen on the summit*; and not long before that, they observed my fall with special interest, and probably thought that all was up, or down, with me, according to their foregone conclusions. But though I survived the slip, and reached the top, they thought that the mist would prove too much for the solitary traveller; and certainly there was reason in the supposition. It was God's goodness that guided and shielded me all the way.

I said before, that on reaching the Grand Plateau, where the path to the top forks, the one to the right and the other to the left, I took the path to the left. Having gone up by the one curve, I determined to try the other coming down. The first part of the way down was along a snowy ridge, where the step was now to the calf, and then to the thigh. This must have been the *Bosse du Dromadaire*, or not far from it. For the first few minutes, it was a kind of race, for the snow was a fine drag to keep one from slipping. But thereon the mist and cloud came, hiding from view all but a yard in front. Knowing the general outline from the view obtained when all was clear, it was my endeavour to keep on the crown of the ridge, and hold on till it ended in a valley-plain. Meanwhile, a small kind of snow was falling, which, coming upon the face, was a more reviving cordial than *Eau-de-Cologne*. Reaching the plain, and turning to the right, I went down a gentle

incline going between ice-craters, and came to the point where that path meets the other by which the ascent was made. From that downward, I passed over the old ground. The far view being excluded, the eye was more drawn to the things near at hand. The mist lifted up a little in going down the series of plains and terraces, revealing now and then the ice-masses crowning the heights, while the blocks of ice by the path pointed to the quarry-faces above, from which they had sprung. Now and then I came upon a crater where the fallen floor of ice, itself covered by drifts of the purest snow, was inclosed by a projecting wall of green and blue, from whose brow all round hung a fringe of icicles through which sported the colours of the rainbow. The thawing of the snow made the way down the stairs somewhat critical, as the foot more frequently dropped into holes, or felt the snow slipping from under it. I had to cling to the hill-face like the limpet to the rock, striking the stick deep into snow-ice as I went along. Ere long I came to the gap which had given me trouble in the morning, and looked upon it with curious interest. To leap down from the wall across the chasm was easy. Walking across the sunken flat in the middle, to the rent and wall on the lower side, there was another leap to the general level, but one not difficult. Soon thereafter the Grands Mulets came in sight.

Arriving there, I found three tourists—namely, two Englishmen, brothers, I think, and a Swiss, with their guides. We sat down to meat together, and had a free ‘crack.’ After taking something to eat, I might have resumed my descent, and reached Chamouni that night, being comparatively fresh; but the thought that the way would be crisp with frost, combined with the pleasure of intercourse with intelligent men, persuaded me to remain.

That night, I was overtaken by a new experience, which came about in this wise: I had made a miscalculation in not taking preserves for the eyes. It is true that I had a veil, but that was of little service. The consequence was that the sun and snow threw a burning brightness upon my eyes, which, however, was not felt till the evening. I could not sleep for a feeling as if grains of sand were on the eyeballs; they were now and again rubbed, to bring these imaginary motes to the eyelid shore; but they would not come. The three gentlemen, with their guides, started early in the morning, it being their purpose to reach the top that Saturday. Some time after, I prepared for the downward journey, but found it vain, for I was blind, and as you may believe, greatly annoyed. After repeated efforts groping through the hut, and going outside to try if the presence of the snow would be able to send light through the gates so suddenly blocked and cut off from day, I was obliged to halt. Some time in the forenoon, the three tourists and their guides returned to the Grands Mulets. On reaching the Grand Plateau, it was deemed advisable, owing to the state of the weather, not to proceed farther. Hence the reason of their early return. Their mind was to go down to Chamouni. As for myself, my sight was, if anything, better. I could see something vague before my feet, but that was all, and to have attempted the road myself in that state would have been suicide. It was frankly proposed to me that I should go down with them.

I decided to accept the generous offer. It was a generous offer, as one in my condition *might* perchance endanger his neighbours. At the same time I did not think that I would endanger them, else I had kept aloof. My reasons for accepting aid were stronger than those of a contrary kind. In the first place, to refuse the offer would be unhandsomely stiff, seeing I was not able to go alone; in the second place, it was Saturday; in the third place, I had little time to spare; and lastly, there was no cure at hand, if nature failed to unbar the gates of light.

So we started in a row, with rope fastened from body to body. I was second last, two noted Bernese guides being one before, and the other after me. A respectable length of tether was between each of us. I entered upon a new experience, a piece of work in some respects harder than any yet encountered. Trying to get a glimmer of light before my feet, and learn when to make a leap across a crevasse, I felt the want of a pair of eyes more than the presence of a pair of men. Now my eyes would get a glimmer of refreshing light, and then the old haze would creep over them, requiring me to ask when I came to the rents. But we all got safe across the ice, and hastened from under the Aiguille du Midi to Pierre Pointue. After dinner at Pierre Pointue, the three tourists and their guides made for Chamouni, and I remained behind to try a cure which Mr Couttet had in the form of a bitter liquid. The eye had to drink it in winking. I was well treated there, and had a sound sleep, with the voice of an avalanche or two ringing through it. On Sabbath morning I awoke seeing dimly, but only through a pair of blue glasses. After breakfast, I went out, and descended to Chamouni unaccompanied.

FALLEN FORTUNES.

CHAPTER XL.—AN AUTHOR AND HIS EDITOR.

ABOUT halfway between the Bank of England and Lasinghall Street* a position somewhat typical of many of its tenants—lies Abdell Lane. A street so narrow, although the houses are but three-storied, that in the sunniest days it is always dim and cool except at noontide; while throughout the winter and half the spring, the inhabitants pursue their avocations solely by artificial light. Their callings are various; and in many cases would be difficult to explain to the public satisfaction; and yet they have some right to be called respectable, since a rent of about two hundred pounds *per annum* is paid *per room*. Off Abdell Lane lies Abdell Court, connected with the larger thoroughfare by a huge arch (itself honey-combed by human tenements), through which the astonished passenger comes upon a tree, a pump, and a paved yard, in which for hours at certain seasons the sun is distinctly visible. The rents are higher here than in the lane, although the place is only approachable by foot-passengers. In fact, that is a circumstance which is a ground of boast to its residents, since it shows that the commercial element (in the shop-form) does not intrude itself. On the side of each door are painted in black and white the names of each occupant, as in Lincoln's Inn and the Temple; but there are no lawyers in Abdell Court. They

* In this street is situated the Court of Bankruptcy.

are chiefly brokers, with a good sprinkling of that mysterious class of gentry called 'financial agents.' Unpromising as the material soil appeared, the seed of many a goodly mercantile tree had been dropped in Abdell Court, to grow and grow, and to bear golden fruit: also other trees quite as promising, but which never coming to maturity, were by many contumeliously termed 'plants.' On the ground floor of one of these houses, there sits, in what might be called by contrast with its congeners quite a spacious apartment, a gentleman with whom we have made acquaintance under other circumstances. Black and gray are now his only wear, but the neatness and completeness of Mr Holt's attire is almost as remarkable as it was at Riverside. Perhaps it is the effect of that sombre dress, but he certainly looks paler and older than when we saw him last: the hair about his temples has thinned, and the lines about his mouth have deepened; if we did not know that his investments are always made with sagacity, and have never given him cause to lose a wink of sleep, we should call his expression careworn. He has an open ledger before him, and a pen in his hand; yet he is not engaged in calculation. A letter in a large, round, and rather sprawling hand lies on the page beneath his eyes, and he is conning it attentively.

'DEAR MR HOLT,' it runs—'I cannot say how much I am obliged to you for your beautiful present; the watch is much too handsome, I am afraid, for a boy like me, but I will try to take great care of it. I have just found out that it strikes the hours and the quarters. We have been in great trouble, as Jeff will have doubtless told you; but my sisters are pretty well in health, and beg to be remembered to you.—I am yours truly and obliged,

ANTHONY DALTON.

'P.S.—Please give my love to Jeff.'

Mr Holt had read this somewhat bald epistle half-a-dozen times, and yet was as interested in it as ever. 'It is cleverly written,' he muttered to himself; 'but it is not all one piece. "Much too handsome;" and "Will try to take great care"—that is not the boy's. I wonder which of the girls helped him with it? "Jeff will have told you;" that is like Jenny's touch. She pretends to believe that I only hear of their welfare through Derwent; and then, again, "Give my love to Jeff," sounds like her sharp tongue: she writes that to annoy me. But then she would never have made him say that they begged to be remembered to me. I am sure that's Kitty; dear, delicious, tender-hearted Kitty!' He heaved a deep sigh, and stroked his forehead with his hands.

'How nearly I lost her!' he went on softly to himself. 'If things had not gone just as they have, she would be by this time out of my reach. What a frightful risk did that madman make me run!' He rose from his seat, and pulling down the window, although the day was bitter cold, stood facing the draught. 'Two months, three months, four months, and not a scrap of news of the ship. All must surely be safe now. The very stars in their courses have fought for me. However, it is the very last boon that I will ever ask of Fortune; hereafter, I am independent of her. If I were bankrupt to-morrow, my books would be a model. There is not a flaw from first to last. If it had happened otherwise, I wonder if I could have weathered the storm? With the world, perhaps;

but with him, never. He would have been implacable, unmerciful. It would have been no wonder, poor devil. And *she*—yes, she would have loathed me. I can understand now how it is that men who cannot possess those they love, are driven to kill them: as to killing themselves, that is the most natural thing in the world; and next to that—yes, I can understand it.'

Besides the usual almanac in its frame, and one or two plans of estates, in the West Indies and elsewhere, there were several huge maps hung up in the room, to one of which he now directed his attention. This was a map of South America, shewing a great deal of the ocean that lies between us and it, with the track of steamers marked out upon it. He had done so many a time before, and he now again took his pen, and with the handle of it traced out the course. So engaged was he in this occupation, that he did not notice a knock at his door nor the entrance of a visitor, until his voice—a rich, unctuous, and somewhat boastful voice—announced his presence.

'Hollo, Holt; how are you? Studying a sea-chart, eh? That looks dangerous for somebody; since you are a ship-owner.'

'Yes,' answered the other coolly; 'I was trying to fix upon the most convenient spot for scuttling a craft.'

'Well! you looked as if you really *were*, when you first caught sight of me. South America, eh? Brazil, I suppose? Mines, for a hundred!'

'You are always right as a rule, Dawkins; and since this particular case happens to be the exception, that proves it. My mind was not fixed on the land at all, but on the sea. I was wondering whether by any possibility the *Flamborough Head* could be still above water.'

'I'll bet you ten to one against it; come, I'll bet you twenty. You have not underwritten her, have you?'

'Not I. I was not thinking of the vessel at all, but of a poor fellow who sailed in her—John Dalton.'

'Oh, indeed. Friend of yours, I remember. Well, I shall say nothing against him, then. But of all the overbearing, insolent fellows I ever met—with-out a penny to bless himself too—he was about the worst. By Jove, you should have heard what he said to Lady Beever, in my own house, under my own roof. We all thought he was off his head.'

'Yet he was a general favourite, and thought very agreeable,' observed Holt.

'Agreeable? Then I don't know what it is to be agreeable.'

'Possibly,' said the other dryly; 'or perhaps you annoyed him. If Dalton was rubbed the wrong way, you saw sparks.'

'Sparks, equal. It was a general conflagration. Lady Beever has never forgiven my asking him to meet her. It would have been a liberty in Rothschild, but for a ruined man! For it was after he *was* ruined, in that *Lara* mine. Curiously enough, I came to talk to you about that very thing. You never had anything in it yourself, I believe?'

'Why do you say that, my good sir, when you know I *had*?'

'Well, well, don't snap my nose off. It was a piece of delicacy on my part, because I knew you plumed yourself on never being connected with anything shady.'

'Oh, I see. Why didn't you say you were going

to be delicate? I could scarcely come to that conclusion from analogy.'

'I don't know about analogy,' said Mr Dawkins frankly. 'I came here on business. There are people still inquiring about that mine, I hear.'

'Indeed. Do you want to buy any shares? They are not quoted, but they can be got cheap—except for the liability they entail.'

'Well, no; I don't exactly want to buy any—myself. But do you know'—here he dropped his voice to a whisper—'Beevor does not think so badly of them?'

'So badly of them as *what*?' answered Holt contemptuously. 'If he thought well of them, why didn't he buy some of Dalton's; he had an opportunity, you tell me, and Dalton, poor fellow, would have been only too glad to sell. You know what everybody else knows, I suppose, about the *Lara*?''

'Yes; but there's that fellow Tobbit, the expert'—Mr Holt made a sign for silence, and touched a hand-bell.

There entered a handsome young fellow from the next apartment, where, indeed, he could have been seen sitting at his desk, throughout this interview, through the glass door which communicated between the two rooms.

'Mr Derwent, you can take an hour, if you please; I shall be here myself till three.'

'Thank you, sir.' The young man was about to leave the room, when his eye fell on Tony's letter; the colour came into his face, and he hesitated, as though about to ask a question.

'I had news of our friends in Sanbeck, by-the-by, this morning,' observed Holt carelessly; 'they desired to be remembered to you.'

Jeff bowed, and passed into the inner room, from which another door communicated with the passage. Not until he was seen from the window crossing the courtyard, did Mr Dawkins speak again.

'You have a new clerk, I see, Holt; he has an honest face; but he is deuced young to be trusted.'

'Yes; but I don't trust him.'

'Oh, I see. Some relative, I suppose? Comes from the country, I think you said?'

'I didn't say so; but he does.'

'Do you think he heard me mention Dalton's name?'

'No; and if he did, it would make no difference. I only sent him out because I had no occasion for his services just now, and I know the lad pines for the open air. His life has been passed in it.'

'That is very considerate of you. Where do you think he is gone? To Primrose Hill?'

Some people have no resources in themselves: Mr Dawkins was not one of these. He could even laugh by himself—at a joke of his own making—and he did it now.

'My dear Holt, what a deep card you are!' said he admiringly. 'It is a wise man who has a fool for his clerk.' Then he proceeded to business. It does not concern us to know how these two gentlemen discussed the character of Mr Tobbit, the great mining expert, or to what conclusion they came; let it suffice to say that Mr Dawkins departed from Abdell Court convinced, despite the opinion of his millionaire friend, that speculation in *Laras* would be very unprofitable.

Let us rather follow the footsteps of Geoffrey Derwent during his hour's holiday. It was not the first by many that his employer had given him during the wearisome days he had passed in his

new calling; he had really shewn the consideration to him which Mr Dawkins had suggested in irony, and had treated him with marked politeness at all times. Moreover, he had given him an insight into business affairs, for which Geoffrey was more grateful than for all else. It gave him hopes of making his own way in the world, when he came of age, and the slender fortune should accrue to him of which Mr Campden was the trustee. It was even possible, he thought, that the money might be advanced to him by his good-natured guardian before that period. It is amazing how far a good introduction, backed by tolerable wits and a little money, will go in certain City callings which (like the ham in the sandwich) lie between the Commercial and the Official, and yet belong by rights to neither. Notwithstanding his speech to Mr Dawkins, Mr Holt did put trust in Geoffrey, for he had found out that the young fellow could hold his tongue; and as he never confided to him anything discreditable, it was fair to suppose that the business of Holt and Company, though certainly of a heterogeneous description, was *bond fide* and respectable. Indeed, as Jeff reflected, how could it have been otherwise, since Mr Dalton had been (as he understood) in some measure connected with it; nay, still more, had not Mrs Dalton herself recommended him to his present employer. This fact alone had really given Jeff a certain respect for Mr Holt, which, as we have seen, he had been far from entertaining at Riverside; and being very sensitive to kindness, this feeling would in any other case, under the same circumstances, have grown to be regard; but it is quite possible to respect people without liking them—indeed, it is almost as common as to like them without respecting them—and Jeff disliked his employer very cordially. He would work for him faithfully, and consult his interests as though they were his own. But he could not return good-will for what he felt was only a pretence of it. Every act of civility of his employer he, in fact, more or less resented, since he was well aware that he was indebted for it to Kate Dalton. He knew that the other calculated upon his telling the truth concerning his life in Abdell Court, and was resolved that he should have nothing but good to tell. He was not even afraid of that pretty constant correspondence that he must have been aware went on between his enemy Jenny and his young assistant. There was security in Jeff's honesty, equal to any guarantee that could be got with sign and seal in the neighbourhood of Abdell Court. Holt had not been sorry that his one invitation to Jeff to dine with him at his club had been respectfully declined, upon the transparent pretence of a previous engagement; business relations run comparatively easy even when folks are not *en rapport* with one another, but social intercourse is more difficult to be maintained. Mr Holt had never so much as inquired where Jeff's lodgings were, and Jeff was not likely to volunteer the information: they were two very small rooms, in a suburb of Islington, which had been recommended to him, through Mrs Dalton, by Mrs Haywood. They were cheap and clean, and he would be able to see green fields from them when the spring came. In spite of his ardour for work, and for 'getting on,' which was immense, he pined for the country, even in these winter days. But on the occasion of which we

speak—his hour's holiday—he did not go, as was suggested, to Primrose Hill; he bent his steps to a spot which puts forth leaves at every season, Paternoster Row. What would Mr Dawkins have thought of his friend's sagacity, had he guessed he employed a clerk who was not only a fool, but an author! Yet so it must be, since Jeff enters an establishment over which is written, 'Office of the *Smellfungus Magazine*,' and passing through the outer apartment, which coarse minds would call a book-shop, knocks at a little door inscribed 'Editor's Room.' It is that knock which betrays him to us; any would-be contributor might have gone so far as to knock—but not like that. The knock of a would-be contributor, especially one of tender years, is a very modest one; it sounds like that of a poor relation, or of a little child who cannot reach the knocker except with the tips of his fingers. Now, Jeff's summons, given sharply with the knob of his umbrella, was the knock of an accepted contributor, and something more: of a contributor who hasn't been paid.

He did not even wait for the answering 'Come in,' but entered at once. 'The City'—whose motto, like that of poor Dalton's travelling companion, is 'Push'—had already done a great deal for Jeff. Besides, he was still in some respects that most audacious and irreverent thing in nature, a boy. We have at present only seen him in the society of ladies, or of his natural guardian, or of his employer; but with the world at large Mr Geoffrey Derwent was something more than at his ease. When he suspected that any one was imposing upon him, he was in particular free-spoken to the verge of rudeness. He had not the modest and retiring manners which good and charitable people are accustomed to attribute to literary geniuses when discovered young.

It must be owned that there was little in the *sanctum* into which Jeff thus impetuously intruded to excite veneration. It was a little stuffy room, lit by a skylight, and boasting of no other furniture than a bookcase, filled with volumes of the *Smellfungus Magazine*, a table, and two chairs; but in one of these two chairs was a being who ought to have commanded respect, for he was an Editor. A small plump man, of cheerful aspect, whiskerless and bald, he presented the appearance of one who had been endeavouring to get rid of all his hair for five-and-forty years, and had triumphantly succeeded. He so beamed with blandness and good-nature that it was like being at Brighton, or standing in front of one of Mr Dyce's pictures, to look at him; you felt you wanted shade.

'How are you, Mr Derwent? Delighted to see you,' said he, holding out a polgy hand, and pressing Jeff's with fervency. 'I have just been correcting your proof for next month's number. I never saw so rapid an improvement in so young a writer—it's marvellous.'

'Yes; I thought that second one would fetch you, myself,' said Jeff coolly.

'Fetch me? Oh, I see! Well, the quaintness of the matter of course goes for something. But as I said to you before, I cannot but think that the mind which could grasp the salient points of so dry a theme—could so clothe dry bones with flesh and blood—might essay something original.'

'The mind has done it,' observed Jeff dryly, producing a manuscript from his pocket. 'Here

is a story of old times: local colouring, archaeological details, spirit of chivalry; in short, the whole boiling.'

'The whole— Oh, I see! You mean it is all redolent of antiquity. Found in a chest, I hope, as I suggested, with a few words of introduction to explain the circumstance. Good; and stated, I perceive, with great frankness and simplicity. You find it easy to be frank, Mr Derwent, I daresay.'

'My nature, Mr Sanders,' observed Jeff indifferently.

'Yes. Now, what astonishes me in your writing is its objectiveness.'

'Ah! that astonishes myself,' said Jeff with a little yawn.

There was a long pause.

'Why, bless my soul,' said the editor, whose face was now invisible behind the manuscript, 'this is a satire!'

'I should rather think it was,' replied Jeff, 'and a deucedly good satire too.'

'Eh!—Mr Sanders looked over the top of the manuscript at Jeff; the young gentleman's face was imperturbable; he was tapping his right boot with his umbrella. 'This is most extraordinary,' murmured the editor.

'That is quite my idea of it,' observed the other.

'I never wrote anything half so good before.'

'I was not referring to the manuscript,' rejoined Mr Sanders blandly; 'that is good, no doubt—in its way. But satires are scarcely quite the sort of thing for the *Smellfungus Magazine*.'

'I didn't mean it for the *Smellfungus*,' cried Jeff.

'Eh! what?' The editor looked up again, but Jeff was only tapping his other boot.

'This is not for you. This is to go to some magazine that pays.—Pray, don't be angry, my dear sir; I am aware that your magazine is solvent—I mean, that pays its proprietor.'

'Now, this is hard,' said Mr Sanders, looking at his book-shelves for sympathy; 'for it was I who brought this young man out—correct me, if I am mistaken, Mr Derwent, but I think I was the first—as editor of the *Smellfungus Magazine*.'—

'And proprietor,' interrupted Jeff. 'That is where the shoe pinches. The literary side of your character is perfection; it is the financial side which is in fault. I have never seen the colour of your money.'

'So young,' murmured Mr Sanders, 'and yet so grasping; this is quite a revelation to me.'

'Very good,' said Jeff; 'I shall make no extra charge on that account; but I must have twenty pounds for the story.'

'Youth is sanguine,' observed Mr Sanders; 'and likewise full of high spirits. You must be joking.'

But Jeff only looked in the fire, and repeated 'Twenty pounds.'

'Well, I'll tell you *what*,' said Mr Sanders clapping his knee, like a man who has resolved to do something regardless of expense—'I'll tell you *what*. In consideration of the two papers I have had for nothing, added to the cost of this story—for there must be no doubt for the future about the market value of such articles—I will give you five pounds. But it must be understood that you give the *Smellfungus* the refusal of your next work, and at the same proportionate price.'

'I'll take the five pounds,' said Jeff after a little

pause, 'on account. Or, look here: pay me ten pounds down, and you shall have the story.'

The deft celerity with which Mr Sanders produced his cheque-book, filled in a cheque, and also a receipt upon stamped paper, was quite pleasant to see. 'Short accounts make long friends,' said he cheerfully. 'And now, my dear sir, that business is over, let me congratulate you on having permanently joined the staff of the *Smellfungus*. I see before you a great -- or at least a considerable future. You have the art -- a very rare one -- of making dry details palatable; of putting fire into old-world facts. All you want are materials. You must come and dwell in the shadow of the British Museum.'

'I live at Islington,' observed Jeff simply.

'Then you must come by the bus to Bloomsbury. The British Museum has been bequeathed to you by the nation to furnish you with facts for the *Smellfungus Magazine*.'

'Very good,' said Jeff. 'I will accept the legacy.'

'It is wonderful to me how -- out at Islington -- you can have procured such materials as you have done. However, the whole affair is remarkable: that at your time of life your taste should lead you to grasp these details of the past' --

'So young, so grasping,' interrupted Jeff. 'Well I must be off now. Ta-ta.'

'Good-bye, my young friend, good-bye,' said Mr Sanders impressively. Then softly repeated to himself: 'Ta-ta. He said Ta-ta. That lad is a phenomenon. Antiquarianism is a passion with him, and yet how he talks! I wonder whether Chatterton talked like that! He reminds me very much of Chatterton -- in some respects.'

THE CHANNEL TUNNEL.

GEOLOGISTS long ago came to the conclusion that the Channel between England and France is of comparatively modern date. Originally, Great Britain was part of the continent, and the sea breaking in, gradually swept away the land, rendering our country an island. When this took place we cannot say. It was long before the historical era -- many thousands of years since. What lends countenance to this belief, is that the two opposite coasts bear a geological resemblance. On both sides there are cliffs, constantly undergoing disintegration. Chalk is the predominant structure, and stretches beneath the sea at no great depth from the surface. The same thing may be said of the Isle of Wight, which is nothing more than a piece of the mainland of England cut off by the invasion of the sea.

The separation of Great Britain from France has been in many respects beneficial. It has given us the development of a distinct history and national character. But now that that is settled, the question arises, whether there might not be a better means of communication between the two countries than the small steamboats which are left to conduct the traffic. Perhaps we should not altogether blame the insufficiency of these steamers. The harbours on each side are lamentably defective, and larger vessels might have some difficulty in making the passage. Anyway, the transit is acknowledged to be bad; and as a last resource comes the project of a tunnel below the sea between Dover and Calais. We propose to give some

explanation of what is intended, and begin by mentioning that at the Paris Exhibition of 1867, there was shewn the model of a tunnel, designed by the late M. Thoué de Gamond. Resulting from this, in 1872 a Company, called the Channel Tunnel Company, Limited, was founded, to establish uninterrupted submarine railway communication between Great Britain and the continent of Europe. Committees were formed in the two countries most immediately interested; Lord Richard Grosvenor, M.P., Mr William Hawes, Admiral Elliot, Mr Stephenson Clarke, and Mr Thomas Brassey being members of the English, and M. Michel Chevalier, chairman of the French section. As the scheme depended from the beginning upon the capabilities of engineering science, the Company did wisely in securing the professional advice of such eminent men as Sir John Hawkshaw, Mr Brunlees, and M. de Gamond himself; and at the suggestion of these gentlemen, it was decided, as a preliminary work, to sink shafts near Dover and Calais, so as to drive galleries extending for about half a mile under the sea, in order actually to ascertain the nature of any difficulties which might arise in the construction of a tunnel as proposed, and to obtain data for estimating the cost of the mighty undertaking.

These tentative operations have recently been commenced; and should they prove as successful as the exploration of the locality and the investigations of the strata that have already been made, the Company will lose no time in obtaining capital in order to complete the enterprise.

In France the law directs that a government inquiry be held in the locality directly interested, before a concession be granted for an enterprise of any important public nature. Accordingly, the Minister of Public Works in 1872 ordered an inquiry to be held in the department of the Pas de Calais relative to the proposed tunnel, and the opinion of all the Chambers of Commerce was also invited. In December the Commission reported unanimously as follows: That, 'considering that the establishment of a railway which would unite the English railway system with that of France, and therefore with that of the whole continent, presents advantages for the interests of commerce and of civilisation, the evidence of which need not be set forth, the Commission is of opinion that it is its duty to declare the public utility of establishing a submarine railway between France and England.' This report, which is a fair echo of public opinion in France, does not go so far as to decide on the practicability of the scheme; but the late Emperor Napoleon, himself an engineer of no mean type, was an enthusiast in the cause, and would undoubtedly have given it very valuable assistance had not the revolution of September deprived him of his throne even before the Company was formed. The members of the Commission too were not a body of engineers; and Sir John Hawkshaw and others, who are engineers of the highest rank, have long been convinced that M. de Gamond's idea not only may be, but will be satisfactorily completed. Sir John Hawkshaw, in 1865, began his practical researches into the nature of the strata beneath the English Channel; but before that time he had given the subject serious consideration. He caused a careful geological survey to be made of the bed of the Strait of Dover, and then, in conjunction with Mr George Wytches and the late Mr Brassey,

had borings sunk on each coast. The result of his experiments and researches decided him in selecting St Margaret's Bay, about four miles east of Dover, as the point of departure for the tunnel; and on the French coast he fixed upon a suitable point of exit about three miles westward of Calais, and midway between that town and the little village of Sangatte. The idea of intermediate ventilating shafts was discarded, and it is intended to depend upon pumps for the supply of fresh air to the submarine passage.

Another series of experiments demonstrated to the engineers that the lower bed of homogeneous chalk is that in which the tunnel should be excavated, and this bed is upwards of five hundred feet deep on each shore below high-water mark. It is probably, therefore, continuous all across, and as the maximum depth of the strait on the proposed line of tunnel nowhere exceeds one hundred and eighty feet at high-water, it is considered safe to work in such a direction that the depth of strata above the subway will be in no place less than two hundred feet. This depth to the casual critic may appear extreme; but it should be remembered that the possible existence of fissures in the seabed must be taken into account; for, supposing such fissures to exist, they would imperil any superficial workings. It is, however, highly improbable that they do exist, and almost impossible that, even in the worst of conceivable cases, they extend as deep down as two hundred feet.

In defence of their scheme the Committee of the Channel Tunnel Company remark that the possibility of tunnelling beneath the sea without being exposed to an irruption of salt water, is shewn in the submarine mines in Cornwall, Cumberland, and elsewhere. At the Botallack and Levant mines in the former, and at Whitehaven in the latter county, several galleries are driven under the sea to considerable distances from the coast, and if we add the many side-galleries leading from them, we have some scores of miles of hollow-way beneath the ocean; some with very little covering to protect them. The manager of the Wellington coal-pit, near Whitehaven, stated to the representatives of the Committee that his pit was 574 feet beneath the level of the sea, and was worked through sandstone, coal, shale, and fire-clay. The extent of the galleries in a direct line beneath the sea, measuring from the pit, was four thousand yards, and the total length of galleries beneath the ocean three miles. Above the workings the water was sixty feet deep, and the thickness of earth between the sea and the roof of the workings varied from seventy to two hundred yards, and scarcely any sea-water was known to enter the mine. At the Huel Cock mine, St Just, the sea is in some places only three fathoms above the workings, and in rough weather the waves overhead can be heard in the galleries. In more than one place indeed, the lode has positively been worked to within four feet of the sea; yet the workmen are not incommoded by the salt water, and but a mere dribble of moisture enters the mine from above.

As we have before noticed, the proposed tunnel will be made in chalk. This, it has been demonstrated, will, if tolerably perfect, resist infiltration from the sea; and from various known facts, the engineers think it certain that very little subterranean water exists in the lower chalk formation. At Dover, for instance, there is a well in the

castle 363 feet deep, or a foot and a half below low-water mark, which, although it traverses three water-bearing fissures, can be pumped dry in three hours by a thirty horse-power engine. At Calais a well was sunk to 1150 feet without success; and in other places chalk has been proved to be chary rather than profuse in its water-bearing properties. We should not, however, reckon too strongly on these experiments in well-sinking. For anything we know, the excavators of the tunnel may come upon a stream of fresh water sufficient to drive a mill—in fact, an underground river. That the occurrence of such a phenomenon is at least possible, we have only to look at that extraordinary flow of fresh water from the chalky mountain on the north of Ventnor, in the Isle of Wight. Besides supplying the town with water, there is a waste of several hundred gallons a minute dashing down as a cataract into the sea. Where that remarkable stream of water comes from no one can tell. It certainly comes from no part of the island, neither is it the result of the insular rainfall. It can only come from some distant river on the mainland, by threading its way through the chalk formation beneath the Solent. Engineers of the Channel Tunnel might give some consideration to this phenomenon, although they could have no difficulty in pumping up an underground river ten times the volume of that which flows under the Solent. They no doubt do anticipate meeting with some body of water in passing through the upper strata before they reach the lower or gray chalk. We have reviewed some of the physical difficulties of the undertaking. The financial ones it is not our purpose to enter into; but we may appropriately conclude a brief sketch like the present with a few topographical and engineering details of the scheme.

As we have already noticed, the tunnel will start from St Margaret's Bay, and will thence proceed by a downward gradient of one in eighty for about three miles. From this point to the centre of the strait, the gradient will be reduced to 1 in 2640; and the French side will be constructed in precisely a similar way. Below the roadway will be the necessary drains; and at the sides will be the ventilating apparatus, consisting probably of a pipe pierced at frequent intervals, and fitted with cocks, from which air may be turned on at needful times. The English end of the completed tunnel will be connected by a loop-line with the South-eastern, and London, Chatham, and Dover Railways; and the French end, by similar means, with the line from Boulogne to Calais, and thence to Paris. The tunnelling machinery to be used is the invention of Mr Dickenson Brunton. It works like an auger, and cuts off the chalk in slices, which break up and fall upon an endless band communicating with wagons in the rear. Through gray chalk it advances at the rate of rather more than one yard per hour; and at this rate it would only require two years to send a drift-way of nine feet in diameter from one side of the Channel to the other, if a machine were started from each end. The contractors estimate that this could be done for eight hundred thousand pounds; and that a further expenditure of four years' time and four millions of money would entirely complete the work.

Whether the undertaking, when finished, will

pay, is a question that time only can answer. The promoters themselves are sanguine of every success; and all that we have the heart to say is, that we hope their expectations may be amply fulfilled. We should be the last to throw cold-water upon such a gigantic and important international project; but at the same time, although we are confident that the plan is perfectly feasible, we have grave misgivings about its ever being pecuniarily remunerative.

DASHMARTON'S LEGACY.

CHAPTER VII.

FROM the time of the sale of Mordien, the circumstances of the Dashmartons began gradually to improve. Including her father's legacy, which had cost her so much, Lucy found that nearly a thousand pounds remained to be divided between her and her brother. Spiller's debts were paid; he took his degree; went into orders, and obtained a curacy at some distance from Friddenden. Here, restrained by his respect for public opinion and his love of approbation, he conducts himself in a very praiseworthy manner.

With her share of the money, Lucy bought out the old lady who had up to this time conducted the principal boarding-school in the neighbourhood, then in a rather declining condition; and joining in partnership with a lady of more advanced age than herself, who supplied the requisite ballast for the undertaking, the firm of Dashmarton and Jennings succeeded in inspiring confidence among the parents of the women of the future, and established a very successful school.

About six months after her settlement in her new quarters, Lucy Dashmarton was waited upon by Robert Harvey, the ironmonger of Meddenham. At first, Lucy thought that he had come to recommend his establishment and its wares; but although the old gentleman incidentally remarked that he should be happy to serve Miss Dashmarton with anything in his line, it appeared that this was not the real purport of his visit.

'It's about Alfred, miss. Me and the missus are getting old now, miss, and we want our son back again, to close our eyes.'

Lucy, alas, was rapidly assuming the severe unapproachable manner of the guardian of a young ladies' school. She could no more help the influence of her calling upon her disposition, than the horse that goes in the mill can avoid his peculiarity of gait. She felt too, that she had made her own position now, and that her future was provided for, without any need of assistance from the other sex, and consequently her tone was somewhat austere and reserved.

'I am sorry that your son will not come back, as you wish him; but how can I help it?'

'Twas you that sent him away, miss, if you'll excuse me; he was happy and comfortable as possible, miss, till you throw'd him over, as I may say.'

'Did he tell you that I had thrown him over?'

'Something of the kind he told us, miss; he led us to believe as such was the case.'

Lucy felt grateful for this. Not to his own family even had he then revealed the real cause that had sent him away from Friddenden.

'Then what do you want me to do, Mr Harvey?'

'Write to him to come back again, miss. There was a time, miss, when we went against Alfred's taking up with you, as strong as people could; but we've changed since then. If you'll only write to him to come back again, miss, you will have our blessing, miss, and glad we shall be to see you wedded.'

'You are very kind,' said Lucy with a sarcastic inflection of voice. 'But how do you know we want to be wedded? Alfred has likely enough a sweetheart of his own wherever he may be; and as for me, I'm wedded to my school.'

'Not he, miss; not he. Alfred writes us regular enough once a quarter, about the time we have to send him his money. He's been a dutiful son on the whole, miss, although he would have his own way in everything—and such, they say, make the best of husbands. Well, let alone that, miss, if he'll only come home, he shall have his twenty or thirty thousand pounds to lay out on a farm.'

'You had better write and tell him all that yourself. I really cannot undertake to do it.'

'You won't, miss!' said Robert, with a sigh. 'Well, it's hard lines on parents, as are troubled too much with their children when they are young, and hardly see nothing of 'em when they are grown up. But as far as you're concerned, miss, I don't know but what you're right. When I first went into business, I felt as if I must have a wife to keep things straight, and so I made up to the missus. But in your business, miss, I should think a husband was rather in the way.'

'I think so too,' replied Lucy, laughing; and after this, Lucy and the old gentleman got on very well together. He was entertained with tea and bread-and-butter, and went away highly pleased with his reception and his hostess. He wrote to Alfred when he got home, giving him an account of his visit. 'She says she don't want to have anything more to do with you, Alfred; but I doubt if she means it. Anyhow, I think if you was to come home, she wouldn't send you away again; and you ought to come home, if you want to see your mother and me before we take the long journey.'

Alfred Harvey received this letter when he was sojourning in a rough shanty in the Far West, whither he had betaken himself in company with some American friends, partly for sport and partly to 'prospect' for a new settlement. He was not altogether insensible to the appeal in his father's letter. On the other hand, as long as he could remember, his parents had at times been, according to their own account, on the very verge of dissolution; and if he returned to England he knew that he would certainly be tempted to cast all other considerations on one side, and make another offer to Lucy. He said to himself that he had already suffered enough on that score; and now that time had healed over the old sore, it would be a pity to subject himself to the renewal of like griefs. Still a sort of uneasy longing made him shorten his stay in the west; and he returned to New York for the winter, still uncertain as to his next proceedings; and the winter passed away—not unpleasantly—and still he was in the same frame of mind. His latest half-resolve was to cross the continent to San Francisco, and make his way thence to Australia, where he thought that a man like himself, with ample capital at command, would be more at home than in the States, which are rather the paradise of the working agriculturist.

In that case he would not revisit England, at all events, for years to come. He might never see his parents again, probably never would; and if he ever returned, he would be a stranger in the land. In this state of uncertainty he chanced to be dining one day at a restaurant a good deal frequented by English visitors, when his attention was attracted by a face which seemed somewhat familiar to him, the quiet watchful eyes of which he found pretty constantly fixed upon him. At last he remembered that he had seen the face at Friddenden, and presently he was able to appropriate it to a definite owner. The man was Streeter, the private inquiry agent who had been concerned in investigating the Dashmorton affair. Alfred had no relish for the sight of the man, and would have taken no further notice of him; but Streeter himself seeing a vacancy at Harvey's table, came over and sat himself down opposite to him.

'Had the pleasure of meeting you before, sir, I think?' he said in a polite affable way.

'Yes; I think so,' replied Harvey stiffly. 'You are not after me this time, are you?'

'O dear, no,' said Streeter with a chuckle. 'Not half so straightforward an affair as that. I was young at the business in those days when you first knew me, and the young lady was too sharp for me. But I was very near collaring it too, sir.'

'Collaring what?'

'The five hundred pounds you brought the young lady, sir.'

'That I brought her! What do you mean? I brought her no money.'

'O yes, you did, sir. Bless you, I saw the letter that it was in, and your endorsement on the envelope—Given me—such and such a date.'

'How did you come to see it?'

'Opened the young lady's desk, sir. I was a great friend of young Mr Spiller's, you'll remember, sir. Well, he asked me there to tea; and when I was alone in the room I took the liberty of overhauling her desk. The note wasn't there, but the old gent's letter was, and it was quite affecting, I assure you. I was very nearly red-hot then; but the young lady dodged me, after all. We must all learn our business, sir.'

'Well, it's all in the way of your business, I suppose,' said Alfred grimly; 'but if I'd known it at the time, I should have had something to say to you. Now, as it happens, I am rather obliged to you for telling me.'

Alfred went back to his hotel in a very thoughtful mood. If this was true which Streeter told him—and he had no reason to doubt it—all his judgment upon Lucy's conduct had been formed on a wrong basis. The girl had been in a very cruel dilemma, and he did not see how else she could have acted under the circumstances. At all events, he had done her a great injustice, and it behoved him to remedy it as soon as possible. He could not help admiring the tenacity with which she had defended her father's memory; and owned to himself that if he could secure the affection of such a girl, she would certainly be true and strong for him in all the turns and chances of life. His mind was made up now; and before he went to bed, he had secured a berth in the Cunard steamer which sailed for Liverpool the next day but one after.

It was spring-time when Alfred Harvey once

more revisited Friddenden, from which he had now been absent two years, and the country was beginning to look green and gladsome. The town itself might have been asleep ever since he left it, and now be just awaking, for nothing seemed to have changed to the extent of a pin's point. Alfred had arrived the night before, and had put up at the *White Hart*, quite too late to pay any visits or make any inquiries. He was specially anxious about Lucy, for his last intelligence of her was six months old, and there was no saying what might have happened since. And now, as he was an early riser, and found that there was no chance of breakfast for another hour or more, he strolled out to look at the town and earn an appetite by a walk. There were no changes to note at Friddenden, except indeed that the cottage was let to a new tenant, and did not look as neat and pleasant as of old. Presently Alfred passed the big white house that he knew as the school that Lucy had taken, now the most interesting to him of any in Friddenden or elsewhere. It was a little way out of the town, surrounded by a low wall, topped by a tall privet hedge, that protected the lawn and garden from prying eyes. On the iron wicket that admitted to this paradise was a brass plate, that bore the inscription 'High Elms House School.' A hasty glance through the iron bars revealed nothing but a long array of windows, still shrouded in blinds, and a white clean-looking facade blinking in the morning sun. Continuing his walk along the field-path to Tattenden, he went on and on till he reached the churchyard, where he seated himself in a sunny nook, lit a pipe, and began to muse.

There was a new and handsome tomb opposite to him; just such a tomb as would hit the fancy of a country gentleman of slightly old-fashioned predilections; a square box-shaped erection, of white freestone, with marble slabs let into each of its sides, and a spear-headed railing inclosing the whole. On the side next to Harvey was an inscription in gilt letters, which he read: 'Sacred to the Memory of JOHN DASHMORTON of Mordien, in this Parish;' with the date of his death, and the legend beneath—'Like as a father pitieth his own children, even so is the Lord merciful.'

Alfred nodded his head over this. 'Yes; this is very well done of Lucy,' he said; and walked up to the tomb to examine it. On the second slab on the next side was another inscription, in freshly gilded letters—'Sacred to the Memory of LUCY DASHMORTON'—

A mist came over his eyes and a faintness to his heart, and he sank down upon his knees before the tomb.

'Are you ill?' said a quiet voice behind him, and a gentle touch was laid upon his shoulder. 'Alfred Harvey, are you ill, or what is the matter?'

Alfred raised his head and saw Lucy standing beside him, a basket of flowers in her hand.

He leapt to his feet, still breathless and haggard-looking.

'It was the name there—the name; and—gracious powers!—Lucy, I thought it was yours.'

'That is to my mother's memory,' said Lucy, softened in spite of herself. 'But why should you have been so grieved, even had it been to mine?'

'It was the suddenness of the thing; it seemed to shew me in a moment how much you had been

to me. There was bitter regret too, Lucy, that I had been so unjust."

"You were not unjust," said Lucy: "you judged me rightly enough. You might have been a little more pitiful; but that does not matter now; I have got over it all. And you, how have you been, and have you enjoyed your travels?"

"Well enough," replied Alfred hastily; "but Lucy, it was only a few weeks ago I heard what convinced me that I had misjudged you terribly."

"Don't let us talk of it," said Lucy; "not here, at all events. I will join you at the church gate, if you will wait whilst I arrange these flowers."

Alfred strolled away to the church gate, whilst Lucy placed the flowers she had brought about her father's grave. When she rejoined him, it was with a cheerful tranquil expression.

"I am truly glad to see you home again," she said: "it will be such a comfort to your father and mother; and I hope that you will settle in the country now."

"That depends very much upon you, Lucy. No; I won't be put off; I've come three thousand miles and more to make an explanation, and now I'm not going to be put off. If your father could speak to you from that tomb, he would say: "Listen to Alfred Harvey."

"Very well, I will listen," said Lucy resignedly; "but I don't see what can have happened since to make things look any differently."

"Lucy, when I was in America I found out what was in your father's letter—the one I brought to you."

Lucy's face flushed to the temples. "I cannot believe it," she said: "that letter was never out of my possession, and not a soul but me knows what it contained."

"It contained that note, Lucy, and you can't deny it. Nay, don't look so troubled; your secret is safe with me; and your wisest plan will be to give me the full right to share it, and with it all your joys and troubles."

But Lucy shook her head and still turned away from him. At that moment the bell from the church tower began to clang out loudly, with summons startling from its suddenness.

"It is the bell for early service," said Lucy. "Tattenden Church is quite changed since you knew it. You know who is the new incumbent?—No! Tresilian Whitwick?"

"Oh, Tresilian, is it?" murmured Alfred, a shade of jealousy and annoyance crossing his brow. "Do you come to these early services, then?"

"No. I don't think any one attends them but Tresilian and his wife."

"Oh, then, he is married?" cried Alfred, with a perceptible brightening up of countenance.

"Yes; he is married, and quite in accordance with his mother's wishes—to a Miss Shawdice—a nice little thing, whom people say the old lady chose because she thought she would be able to tyrannise over the girl completely."

"And the result?"

"A battle-royal ensued on the return of the young people from their honeymoon, in which mamma was completely defeated, and fled discomfited. She has not been to the house since; and there is no communication now between the two families, although they live so near together."

Alfred laughed lightly. "I am glad she has had

a good dressing: a pretentious creature—like a hen with one chick."

"It is as your father says; there is no comfort in children."

"Oh; but what do you think father says now?" interrupted Alfred.

"Well, what does he say?"

"That if he had a daughter like you, I might stop away as long as I liked. What do you say to that, Lucy?"

"I should take the same view as your father, no doubt."

"What! that I might stop away? Come, Lucy; this won't do. I've been after you now these many years; and you can't deny but that, except for one unfortunate mistake, I've been true and faithful all through; and now—you wouldn't break my heart at last, Lucy?"

"You did not care about breaking mine," returned Lucy, a little melted now, and half sobbing.

"My darling! Did I hurt you? I'll spend all my life to make it up to you;" and he seized her hand, and tried to draw her to him.

"No!" said Lucy firmly. "I am not the mere girl I was when you went away. I have a position of my own now, and a calling to which I am attached. We must negotiate on equal terms. Now, if I say "Yes"—mind I have not said it; but if I were to say it, would you stay here and help me with the school?"

"No; I'm hanged if I would. What! be a school-master, or a schoolmistress's husband rather! No; you'd have to give that up. I couldn't endure to live in a ladies' school."

"And I couldn't endure to be a farmer's wife," said Lucy, tossing her head. "There is the outcome of all your fine professions then. In one breath you will devote your life to me, and all that; in the next, you give me to understand that I must devote my life to you. Which is it to be?"

"Both," cried Alfred. "We'll devote our lives to one another. I will have a big farm, and you shall have a big school; and we'll combine the two, as they did at Dottheboys Hall. Come, Lucy, do, and be what you like, as long as you will be mine."

"I must have time to think about it," replied Lucy; and from this she would not depart, urge her as he might. She would meet him that day week at the churchyard in early morning, and he should have his answer; and in the meantime he must not attempt to see her, but go home and gladden his parents' hearts with his presence. To this, Alfred meekly obeyed.

The morning of the tryst was damp and drizzling, so that Alfred, who was on the spot in good time, feared that Lucy would not come. But she was there before the clock struck eight, wrapped up in a waterproof cloak, with a hood over her head, in which she looked like a charming gipsy. Her face was serious enough, but soft and tender in its expression. She gave him her hand, and was the first to speak.

"It was my poor father's last wish," she said; "and you have been very good and true; so it shall be as you like. I tried to do my duty by papa; and I will try and do my duty by you, if you wish me to try. It was very thoughtless of me to bring you out here in the damp and wet; but you must forgive me; and after this I mean to be very dutiful."

But Alfred swore it was the finest, brightest day that had ever dawned; and they trudged home

together arm in arm, mutually satisfied, and delighted with all the world about them.

Miss Jennings, Lucy's partner, was at first greatly shocked at the catastrophe that threatened the firm; but she became reconciled to the event when she found that she would be able to carry on the school on easy and advantageous terms. Robert Harvey was delighted with the turn affairs had taken, and was even better than his word; for he bought the young people a charming little estate near the south coast, with a house upon it that was even brighter and sunnier than Morlieu. And here, as the story-books used to say, they lived happily ever after.

THE END.

MISTAKEN AIMS.

A VETERAN writer on subjects of Social Economy, Mr W. R. Greg, has issued a volume of his collected papers, under the title of *Mistaken Aims and Attainable Ideals of the Artisan Class*. As comprehending a sort of review of the past thirty years, the book is worthy of attention. We see from it how wild theories have been falsified, how little good comes of visionary projects, and how, after all, society in all its departments must fall back on the exercise of individual industry and intelligence.

Peasant Proprietorship of land, first dealt with, has turned out, as we knew it would, a complete fallacy. Owing to climate, nature of soil, and other circumstances, no man in Great Britain can do any good with land unless he has a sufficiency of capital at his disposal to employ labourers, to purchase horses and agricultural apparatus, to procure lime and artificial manures, and to lie out of his money and support his family until he can send the products of his fields to market. The notion that landlords are tyrants, and that it would be very much better for a farmer to own the land he cultivates, is another chimera, hardly worth discussing. There can be no objection to a man buying six or eight hundred acres of land, and setting to work on them as his own farmer. But, would it be economical to do so? Instead of sinking a large capital in buying land, he would find it cheaper to rent it, retaining at the same time the privilege of relinquishing his tenure when he pleased, or at the end of his lease. Mr Greg points out that small proprietorships usually end in disaster. The morsels of land are in time sold, and accumulated in large masses. We know such to have been the case with land allotments in Scotland.

In the paper on English Socialism, there occur some salutary observations: 'Communistic Association, as opposed to Competition, can only, as indeed its more enlightened preachers fully admit—succeed in its object when society shall be Christianised in reality as well as in name; when all men shall be sufficiently purified from selfishness to work with equal zeal for the common good as for individual reward, and to wish for nothing more than an equal portion of the property of the commonwealth. When this point is achieved, the existing arrangements of capital and labour would answer as well as any other; for then every master would exact from his labourers as little toil, and pay them as large remuneration, as equity combined with benevolence would permit. As man

now is—active, selfish, and ambitious, loving his family better than his neighbours, and his neighbours better than that abstract entity called the community—associations, where they differ from practicable partnerships, must be either lost in the whirlpool of competition, or wrecked on the rock of monopoly. Start the most theoretically perfect scheme of communism you can devise; gradually eliminate from it every element which makes it work ill; add to it, as experience suggests, every element required to make it work well; and you will arrive either at the existing arrangements of capital and labour, or at such co-partnership systems as sound political economists have long since recommended. Distribution of employments by preliminary concert, no practicable machinery could effect; competition, if allowed to operate unchecked, will speedily effect a wiser, juster, more productive, more expansive and adaptable distribution of them, than any government, guild, or committee which the wit of man could contrive.'

Mr Greg had once a quiet conversation with an active member of the Parisian Commune who had taken refuge in England. He was an intelligent and not at all an uncultured man, but his ideas were of that amusingly wild nature which might have been expected. The following were his notions: "The artisans and poorer classes of France—that is, of Paris and the great towns—are ground down (*exploité*) by the capitalists, their employers; they wish to reap the fruits of their own labour; they wish, in fact, to work for their own benefit, and not for that of others; they think that all capital ought to belong to the state, and be lent out on moderate interest to associations of operatives, who would thus enter into the full enjoyment of the products of their own industry. They believe that only a Republic, of which the working classes should be the directors, would give them this result; and they know that a Republic of this sort can only be established by a revolution, and therefore they are willing to hazard everything, and upset everything in the cause of such a revolution." Our interlocutor had never distinctly made out either the correctness of his premises, or the beneficence of his anticipated results, even if attainable or attained; but the dream was a grand one, and it had intoxicated his imagination. And for the realisation of this dream, the finest buildings in Paris were destroyed, hundreds of people were massacred, trade paralysed, and society for a time turned upside down.

Some pretty strong language is employed regarding Trades-unions and Strikes in the paper graphically designated 'The Proletariat on a false Scent.' We need quote only a few lines to shew the author's opinions. 'In most trades, moreover, where these associations are in active operation, the tax levied on the employed workman, in order to support in idleness the unemployed, and buy off their menaced competition, amounts to a permanent and very material diminution of his earnings; and it is only where there are such unemployed workmen that unions and strikes are needed to enhance wages or to keep them up. It is probably not overstating the case to say that in many trades every ten operatives have to maintain a possible rival out of their earnings. Lastly, it is undeniable that the operation of unions and strikes is, directly or indirectly (often both), to raise the cost of the article produced—indeed

that is usually the avowed aim and expectation, and must be the result if the *capitalist* is to secure his remuneration. Therefore it is demonstrable that, as the effect is to raise the price of the article the workman *buys* (his house, his clothes, his shoes, his coal, &c.), and fails to raise the *net* price of the article he has to *sell* (his labour)—these unions must be noxious and impoverishing to him. Yet, notwithstanding this unexpgnable process of reasoning, driven home as it has been by the disastrous experience of the operatives during scores of bitter conflicts, they are still persuaded or coerced into supporting these associations, which have driven away or ruined more trades than one already, and we fear will end in expatriating many others. The taxes levied by the unions are far heavier in most departments of industry than those levied by the state.

We conclude with what may be called a summary of Mr Greg's views on the small social progress made by the operative classes in the course of the generation which now approaches its close. 'During that lapse of time, the manufactures of England have enormously increased; the aggregate wealth, as well as the numbers, of the productive classes has augmented in a vast and rapid ratio; the weekly wages of artisans and mechanics have risen from twenty to twenty-five per cent.; their instruction has been unquestionably, perhaps materially, improved; while, as to their very extraordinary increase of power in the political arena, there can be no question whatever. But during the same period it is impossible to say that we can trace any corresponding or parallel growth either in their sobriety, in their treatment of their own wives and children, in the sentiments of friendliness with which they regard their employers, in the sense of justice and consideration which they manifest towards their fellow-labourers, in the sagacity with which they manage their own affairs, or in the wisdom which they contribute to the affairs of the nation. The working men of 1875 (taken in the aggregate, and allowing for large exceptions) do not appear to me less easily misguided, less unwise in pursuit of their own interest, less blind followers to mischievous agitators and leaders, and assuredly neither less brutal nor less intemperate, than those I lived among in 1850. They are as vehement and far more successful in insisting upon higher wages, but not one whit wiser, kinder, or fairer in spending them; far more clamorous for leisure, but little, if at all, more bent upon spending that leisure worthily. In a word, they seem to me to have had nearly everything they demand within their grasp, and to have cast it away for shadows dangled before them by the blind and passionate; they have had a golden opportunity, such as is seldom offered to a nation, of becoming respectable, comfortable, instructed, and secure—a people "with a balance at its bankers"—a people of capitalists instead of proletaires; and to have not so much let it slip foolishly from them, as flung it recklessly away. Even while I write, they—at least their chiefs—have avowed in the most open manner their systematic hostility to "piece-work," and have entered on a dogged struggle to repress it. In so doing they have contrived, as has often been the case before, to put themselves as much in the wrong as was possible, and have chosen their moment as unfortunately as their principles.

They have shewn a curious blindness to the very elements and conditions of England's industrial success, and have declared war upon their own prosperity. But what is worse, they have set themselves in opposition to the simplest and most obvious dictates of equity and freedom; forbidding men to do as well as they can or to work as hard as they wish; declaring that labour shall not be paid according to its real value; exercising an oppression upon more rational and honourable workmen than themselves which few other people would endure at the hands of even a legal and established government; throwing thousands of unskilled labourers out of work who have no concern in their quarrels nor any share in their funds; and without scruple, or apparently any sense of the adjectives by which their proceedings should be characterised, robbing the industrious man of his industry, the able man of his superior skill; and by the one and same step wasting the earnings of the workman laid by as a security against sickness, old age, or failing trade, and the capital of the employer which should be spent in finding occupation for the artisan. These are all features of evil omen, and I am satisfied that no one who has followed the recent history of trades-unions, or penetrated their true character and purpose, will fancy I have in the least exaggerated their grave significance. There are few sadder spectacles than a nation such as ours can live to watch than the ignorant choosing the wrongheaded for leaders, and investing them with power to guide them recklessly, through sure suffering, to late, perhaps too late, repentance.'

AYLIA.

AYLIA was a poor dark-skinned savage, the partner of one who, like herself, was a savage also, and one whom she tenderly loved. He belonged to a caravan which accompanied an exploring party to Shoa, in South Abyssinia, some thirty-six years ago. It was during the season of the year when the temperature of the tropics is at its highest, that the small party was encamped in a sandy arid plain, without a tree or shrub to break the uniformly even and bare monotony which spread itself around as far as the eye could reach, and mingled in the distance with the lurid light of the declining horizon. The shelter of the leader, an Englishman, was surrounded by those of his countrymen, his companions in the hazardous enterprise, and by the wigwams of a batch of savages of the Weecheema tribe, who had been enlisted to accompany the mission for the ostensible purpose of protection, but really to swell the encampment to such imposing proportions as would secure for it that wholesome dread which paucity of numbers could not inspire. They were travelling through a country whose barbarous inhabitants were but a slight remove from the brute creation; who, divided into petty tribes, kept up a perpetual warfare among each other; whose sole occupation was to tend their flocks and herds, and whose principal excitement was to plunder and murder whomsoever they fell in with, and to gloat upon the agony of their expiring victims. There were other women, the partners of the wild followers, with the party; but it is to Aylia in particular to whom our story relates.

Blessed with youth, attractive features, and

more symmetrical form than her dark sisters, Aylia contrasted favourably with them, and was, as it were, a moonbeam shedding its genial light upon the isolated foreigners. Her ready alacrity to oblige, her happy smile or merry laugh, her lightsome tread as she flitted about the camp, all tended to dissipate the gloom which often pervaded the party, and to cheer and enliven them when other sources failed. It was mid-day, and so intense was the heat that all life seemed to shrink from the scorching rays which darted down with unerring directness from the unclouded orb of day. Not a breath of air fanned the heated atmosphere; to breathe was painful, to move was exertion, to look at the glare around was blinding. A mid-night silence prevailed, except when a terrific whirlwind, drawing everything within its vortex, and raising a spiral cloud of dust, swept by the encampment, and drew forth an angry curse from the lips of some drowsy savage whose rest it had disturbed. Suddenly a distant cry is heard calling the 'men-at-arms' to assemble; and each wigwam, which but a moment before appeared like a silent tomb, sends forth a savage armed to the teeth and ready for the strife. It was soon discovered that a band of the Eesan Somali tribe was driving away some of the camels belonging to the party; and the sight which presented itself was one of which no adequate idea can be formed by those who have not visited the torrid zone. The speed at which the camels were being driven, taken in connection with the distance they were separated from the party at the encampment, made them appear, through the reflecting medium of the mirage, like so many mutilated animals floating in or darting through the air. At one moment would be seen the head of a camel separated from its trunk and projected some feet forward; at the next the fore-legs would seem as if they were running away from the hinder; and again, the whole party would seem like so many mutilated fragments of men and animals hurled by some giant force across the plain.

Those who went in pursuit did not overtake the marauders till nearly sunset, when, having rescued the camels, they returned, but not without the loss of two men killed and the misfortune of a third severely wounded. Lamentable to say, Aylia's partner was one of the killed. He had been the foremost of the pursuers, and dearly had he paid the penalty of his daring. When the melancholy news was communicated by those who returned, all eyes were directed to Aylia's wigwam; but she was not there. Two days passed, and still the lonely hut was deserted; no one could tell whither she had gone. On the third day she returned; but alas! how changed. Her swollen face, her bloodshot eyes, her heaving breast, all bore witness to the intense anguish of her bereaved heart. No loud lamentation, no streaming tears, the accompaniments of slight sorrow, marked her demeanour. She spoke not, she complained not. With unsteady gait and faltering steps, she made for and entered her wigwam, and seating herself upon the saddle of a camel, hid her face in her hands, and thus remained until those who felt for her approached. A vacant stare was all she gave them; and deaf to all the condolence they so feelingly offered, she closed her wigwam, and shut herself in, to solitude and self. What hope had she, a poor untutored savage? The

range of her affections had been circumscribed within a narrow circle; they had been concentrated on him who had been the pride of her existence; and he was gone, gone for ever! The future had no charms for her; it was a hopeless blank. The gloom of despair had settled upon her soul; and she sickened, drooped, and died, without a tear, without a moan.

Her three days' absence was subsequently accounted for. As if by presentiment of the calamity which was to befall her, she had followed the party in pursuit of the camels, had recovered the dead body of her partner, wept over it as long as it could be kept above ground, and then consigned it to its last resting-place.

DOGGIE SQUIB.

Mr doggie Squib is sad or shy;
Sometimes warlike, sometimes tender.
He's honest; but he's also sly,
Oft watching with unblinking eye
Hearts of flame across the fender.

Then, with a start, he makes a rush,
Turning to me with a whimper;
And in his eyes a liquid flash,
And, almost, on his face a blush,
Blended with a sort of simper.

I guess his moods: from tip to toe
Keen and sentient he expresses
Sarcasctic coughs and sighs of woe,
And shrewd resolves of yes or no
In the matter of caresses.

The doggie Squib is charmed of late;
He, I think, beguiles his tedious
By striving much to egotize,
Discerning life and solving fate,
Like a subtle spirit-medium.

His truthful eyes are fixed on me,
Half in query half devotion;
As though resolving some decree,
Or calculating things to be,
Or concocting some odd notion.

To thinking, Squib has not been used;
He grasps a thought, but cannot fix it;
Then half indignant, half amused,
Disheartened, waggish, and confused,
He invites my hand and licks it.

'Tis a much perplexed occasion;
So he bethinks again, and begs,
Equal to the situation,
And makes then a mute oration,
Most eloquent on hinder legs.

O Doggie Squib! The great behest
In Nature's universal plan
Denies thee speech, and thy dumb quest
Unfolded must for ever rest
Beyond that gulf 'twixt dog and man.

THE AGE OF THE WORLD.

THE cosmogony of the world has puzzled the greatest philosophers. Such was the sagacious remark of Jenkinson in the *Vicar of Wakefield*. Had the charlatan lived in the present day, he might have made the same observation. In a hundred years we have hardly got nearer the truth on the subject. The notions about the age of our globe are considerably changed, still nothing is determined with certainty. If any one wishes to see how the battle of the cosmogony stands, and who are the contending parties in the struggle, we recommend the perusal of an article, 'Modern Philosophers on the Probable Age of the World,' in the *Quarterly Review* for July. It is thoughtful, lucid, and scientific—not perhaps what every one will agree with, but presenting a fair exposition of the latest phase of the discussion.

The ordinary chronology which assigns some six thousand years to the age of the globe, or, properly speaking, the date of creation, is set aside as untenable, because demonstrably not only at variance with historic and archaeological research, but with the substantial discoveries of geology. The leading fact dwelt on is, that in all the grand operations of Nature, God works by a 'process of slow development—by means beautifully simple, and involving no violence, and no haste, yet irresistible.' On this basis some millions of years must have elapsed since the earth came into being. 'Modern English geology holds that all geological changes have been effected by agents now in operation, and that those agents have been working silently at the same rate in all past time; that the great changes of the earth's crust were produced, not by great convulsions and cataclysms of Nature, but by the ordinary agencies of rain, snow, frost, ice, and chemical action.' The rising of the ground at one part and the sinking at another is familiarly known, and so are the encroachments and recessions of the sea. Torrents wear away hill-sides, and excavate ravines and valleys. All that goes on before our eyes, and no one entertains any doubt

about it. The question substantially is, how long have the changes been in operation?

This brings us to the views held on the one hand by geologists, and on the other by professors of mathematics and physical science. These latter assert that the sun and the earth, in fact the whole solar system, cannot, from their physical condition, have existed for the enormous length of time claimed by the geologists. 'The principal grounds,' says the reviewer, 'upon which scientific opinion has recently declared itself in favour of limited periods for the duration of the solar system are based, first, on the belief that the earth is cooling—if not rapidly—at such a rate as to make it impossible that it should have existed for very many millions of years; secondly, because there is reason to believe that the earth is not now rotating on her axis with the same rapidity as in former ages; . . . thirdly, because the sun is parting with caloric at such a rate as to make it certain that he could not have continued to radiate heat at the same rate for more than a few millions of years; and lastly, because the changes in the earth's crust, stupendous and varied as they are, could have been, and probably were, accomplished in the course of much shorter periods than popular geology has hitherto considered possible.'

The inquiry as to the date of creation must, it is said, be distinctly limited to members of the solar system. That system floats in space by itself; has nothing to do with the stars, the nearest of which to us is two hundred millions of millions of miles distant—a distance so great as to be beyond human comprehension; and if we conjecture that there are still stars far beyond out of sight, we are lost in the infinitude of space. To keep to the solar system, which is all we can do, it is a group of bodies whirling in solitude, and sustained and regulated by certain distinct laws of gravity impressed by the Creator, and inherent in matter. But how was the solar system set agoing? How was it produced? Here we are referred to the operations of Sir William Herschel, whose discoveries with his large telescopes we lately described. Herschel, as we mentioned, swept the

heavens for nebulae, that is to say, light cloudy matter, which he imagined to be the rudiments of new suns and new worlds. This was in 1779, and his ideas were afterwards elaborated by Laplace. The idea was stupendous. Herschel, assisted by that wonderful being his sister Caroline, discovered enormous numbers of nebulae 'in every part of the heavens, and apparently in every stage of progressive development.' He classified these nebulae according to the stage of growth at which they had arrived. Some were very thin and vapoury, others were more dense and milky in appearance, and finally they seemed to possess a central nucleus, 'nearly approaching the appearance of stars.' There, as was believed, was exhibited the growth of solar systems under the creative hand of the Almighty. In time, the matter thickens, and overpowered by the attraction of gravity, the nebular mass rushes to a centre with concentric rings. These rings break off as planets. 'As each planet was in turn cast off, the central mass contracted itself within the orbit of that last formed, and formed the sun.' Such is the theory of Laplace. Well, but what of the sun's light and heat? On this point the explanation offered by the writer of the article in question is based on a scientific principle not usually thought of. Heat and force are convertible terms. The concussion of two or more hard substances produces heat, and extreme heat produces light. 'If the particles of a vast vaporous mass were brought into collision from the effect of their mutual attraction, intense heat would ensue. The amount of caloric generated by the arrest of the converging motion of a nebula like the solar system would be sufficient to fuse the whole into one mass and store up a reserve of solar heat for millions of years.' If that conjecture—for it can be nothing more—be correct, the mystery of the sun's light and heat is explained.

Another principle in physics is little thought of. The sun's heat is susceptible of being stored up for the use of man. How that should be is curious. The rays of the sun nourish the growth of trees; forests of trees are overwhelmed by geological changes, and, pressed into a hard mass under newly formed strata of sand, assume in course of ages the form of coal. The coal is dug, and being burnt, gives out the heat which was received from the sun. In sitting round a coal-fire, we are warmed by the sun's heat which was diffused on the surface of our planet millions of years ago. In other words, when we buy coal, we are buying a quantity of stored-up sun's heat. We speak of forests being metamorphosed into coal millions of years since, but the period is vague as well as various. Forests of mature growth have been submerged. On the upper stratum of land over the spot, fresh forests have flourished and been submerged in turn. The process has been repeated several times, and all we can really say with certainty is that the different layers of coal have been produced by successive submergings over a very

long period of time. These facts concerning the origin of coal are amusingly illustrated in the life of George Stephenson. On one occasion, when George was at Drayton Manor, the seat of Robert Peel, he said to Dr Buckland: 'Can you tell me what is the power that is driving that railway train?' 'Well,' said the other, 'I suppose it is one of your big engines.' 'But what drives the engine?' 'Oh, very likely a canny Newcastle driver.' 'What do you say to the light of the sun?' 'How can that be?' asked the doctor. 'It is nothing else,' said the engineer; 'it is light bottled up in the earth for tens of thousands of years—light, absorbed by plants and vegetables, being necessary for the condensation of carbon during the process of their growth, if it be not carbon in another form—and now, after being buried in the earth for long ages in fields of coal, that latent light is again brought forth and liberated, made to work, as in that locomotive, for great human purposes.' As is observed by Stephenson's biographer, 'the idea was certainly a most striking and original one: like a flash of light, it illuminated in an instant an entire field of science.'

Reverting to the difference of opinion between Sir Charles Lyell with other geologists and that of the mathematicians regarding the age of the world, the reviewer, speaking geologically, sums up by saying: 'It is eighty millions of years since the lower tertiary formation, one hundred and sixty millions since the formation of the coal-measures, and two hundred and forty millions since the beginning of the Cambrian period! And beyond that inconceivable antiquity lie the whole range of the primary rocks which contain no fossils; adding, that 'Mr Darwin assigns to the world even a greater age.' We confess that all this looks like vague speculation; and who knows but some fresh inquiries a few years hence may upset the notions now so authoritatively advanced. Great periods of time have no doubt to be allowed for, but it would be well to be cautious in fixing these periods with precision.

Any calculations regarding the age of our planet would require, as is said, to be modified by the fact of a gradual retardation of the earth's diurnal rotation. It is alleged there is a retardation in consequence of the daily tidal waves, so that 'the standards by which we measure time are less precise as we recede further into the past. . . . As Professor Tait puts it, the earth has always to revolve within a friction brake. Adams adopted this theory of tidal friction; and in conjunction with Professor Tait and Sir William Thomson, assigned twenty-two seconds per century as the error by which the earth would in the course of a century get behind a perfectly constructed clock (if such a machine were possible).' It would require much more conclusive reasoning than this to prove that the movements of our planet are getting out of order. Nothing in nature seems so marvellous in creative wisdom as the prodigious accuracy of the earth's diurnal revolution, which year after year may be reckoned on to an instant of time. Leaving the reader, if he pleases, to pursue the subject in the article referred to, we can only say that the theories propounded are eminently suggestive, but nothing more. It is not remarkable that there should be differences of opinion among men of science concerning the dark

and stupendous questions of the cosmogony of the world. All we deprecate, in the present state of human knowledge, is rash dogmatising one way or another.

W. C.

A FRENCH MUSSEL-FARM.

THE mussel is not popular in England as an article of food, but there is a great demand for it as bait, and the fishermen along our coasts experience no little trouble in collecting a sufficient quantity for their ever-increasing wants. Hence it is that public attention has latterly been directed to the desirability of establishing mussel-farms. Under these circumstances, little apology is needed for giving the following abridged account, from the third edition of Mr Bertram's *Harvest of the Sea*, of the mussel-farm at Aiguillon, on the west coast of France, how it came to be established, how it is worked, and what amount of profit it yields annually.

Aiguillon is a little out-of-the-way place hard by the port of Esnandes, which in its turn is about seven kilomètres from La Rochelle, and not far distant, therefore, from the Ile de Ré, so famous for its oyster-grounds. It happened, as far back as 1235 A.D., that an Irish vessel laden with sheep was wrecked in the bay, and all the crew save a man named Walton perished. This Walton was a man of some ingenuity; and no sooner did he find himself safe and sound than he turned himself about to provide a regular supply of food, so that he might not prove a burden to the kind fisher-folk to whom he was indebted for his safety, and who were themselves almost destitute. But no matter in what direction he looked, he could see nothing but an expanse of liquid mud, which it was well-nigh impossible to traverse, at least on foot. Accordingly, he set about constructing a sort of canoe, still in use at the present day, and called a *piroque*. In this he managed to explore the coast; and soon found that large numbers of land and sea birds were in the habit of settling on the water and in the mud for the purpose of collecting food. Walton therefore made himself a number of long stout stakes. These he fixed in the mud, and attached to them a kind of purse-net; the result being the capture every night of a large number of aquatic birds. It was not very long before he found the posts to which he had affixed his nets covered with the spawn of the edible mussel. These grew rapidly, and when mature, were found to have a much finer flavour than the mud-grown molluscs whence the spawn had floated. Walton at once saw how he could not only multiply his food-supplies, but likewise create a lasting industry for the benefit of the folk among whom he had been thrown. So he went on multiplying the stakes, and found there was comparatively no end to the produce. 'In ten years after the shipwreck,' says Mr Bertram, 'the bay was covered with an appropriate and successful mussel-collecting apparatus, out of which has grown the present extensive commerce.'

The work of cultivation is carried on very systematically, the same method prevailing now as in the days of Walton. One singular feature in connection with it is the mode of progression over the mud-banks, the mud being very soft and smooth, and without any sun-baked furrows to interrupt the progress of the canoes. The propulsion of the

vessels is after a very primitive fashion. The man kneels in the little boat with one leg, while the other, incased in a huge boot, is planted deep in the mud. A lift of the vessel with both hands, and a simultaneous shove with the mud-imbudded leg, 'and lo! a progress of many inches is achieved.' This frequently repeated soon carries the industrious labourer from one field to another. When a new *trousseau* has to be provided for the *bouchots* (as we shall presently explain), or a stranger has to be taken over the fields, two men load a canoe and work it out between them. Sometimes three canoes are lashed together, when the *bouchotier* in No. 1 propels with his left leg, and he in No. 3 with his right, by which means they get along in a tolerably straight line and with considerable speed.

Besides the stout stakes to which he originally affixed his nets, Walton planted others 'in long rows in the form of a double V, with their apex open to the sea, the sides being interlaced with branches of trees, to which the mussels, by means of their byssus (beard) affixed themselves with great aptitude.' These form the *bouchots* above mentioned, and are 'so arranged one with another as to serve as traps' for the fish that frequent the coast; so that the fishermen have a chance of catching some fish, while they are always certain of securing a canoeful of mussels. To this end the men in search of fish set out for the *bouchots* a little while before the tide recedes, and affixing small nets to the various openings, are sure to intercept any fish that may have come in to feed with the previous tide.

The farm covers eight kilomètres, being laid out in four fields or divisions, each of which has its peculiar name and use. The number of *bouchots* is stated to be at least five hundred, each representing a length of four hundred and fifty mètres, and the whole forming a wall of strong basket-work, equal in length to two hundred and twenty-five thousand mètres (a little over two hundred and forty-six thousand yards), and rising six feet above the mud.

Great pains are taken to keep the *bouchots* in order, the work of repair being constant. Along the cliff-wall which protects the bay are kept the strong wooden stakes, twelve feet in length, and of considerable girth, which form the *trousseau*, as it is called, of the *bouchots*. These are sunk six feet in the mud, the upper part being furnished with a number of strong supple branches, twisted into the form of basket-work, on which are grown the annual crop of mussels. The *bouchots* have different names according to their different uses and positions. Those farthest away in the water, and rarely, therefore, uncovered by it, are called *bouchots du bas*. These consist of large, strong, single stakes, planted close to each other—three to the mètre—and serve as spat collectors, the spat being locally called *naissain*, so that there may be always a store of infant mussels ready for any of the stakes which may accidentally become vacant. The spat voluntarily fixes itself to these *bouchots du bas*. About February or March they attain the size of a grain of flax-seed; in May they are about as big as a lentil; and in about two months more they are as large as a haricot bean, and are then called *renouvelain*. This is the time for planting to begin, the process being very simple. When seedlings are required for the more inland *bouchots*,

the men proceed, at the lowest state of the tide, to the spat-collecting stakes, and, with the aid of long poles having blunt hooks at the end, scrape off as many basketful as are required. They then paddle to the inland stakes and commence the first stage of the work or planting, known as *la bittise*. A good handful of the young mussels is skillfully tied up by one of the mussel-men (*boucholier*) in a bag of old netting or canvas, and cunningly made fast in the interstices of the basket-work, leaving ample room between each group or bag. They soon attach themselves by the byssus, and as the nets or bags soon rot away by the action of the water, are left hanging in clusters on the *bouchots*, where they increase in size so rapidly as speedily to require thinning out and transplanting, by a repetition of the same process, to stakes still nearer the shore. This twofold process of planting and transplanting is observed in order that the mussels may be as much as possible covered with salt water, as they then fatten better.

It will easily be imagined that all this work of repairing the *bouchots* and planting and transplanting is going on incessantly, even at night-time, when the tide is suitable. Some portions of the farm are always under water, and those mussels are the best in quality which are the longest submerged. Care is, of course, taken to keep the mussels as much as possible from being deteriorated by any mud deposits, and for this purpose a good flow of water is provided for between the base of the *bouchots* and the sea-surface. But, in spite of all precautions, many bunches are affected, and this greatly distresses the *boucholiers*, who think more of quality than of quantity. They bear in mind the first experience of Walton, who was induced to turn mussel-farmer by the superior flavour of the mussels which grew on his stakes high above the mud.

When a year's farming has been completed, the mussels are ready for the market; and by the care of the farmer, they are in season the whole year through, though they are best for food in the autumnal months, when Mr Bertram describes them as being deliciously fat and savoury. In April they become milky and less palatable. But the great harvest goes on between July and January. If the mussels are to be sent any distance, they are first carefully separated and freed from all kinds of dirt, then packed in hampers and bags, and sent away on the backs of horses and in carts, there being no less than one hundred and forty horses and a hundred carts employed in the business. The mussels thus sent away are distributed within a radius of about one hundred miles of Esnandes, more than thirty thousand journeys per annum being made in the service. Those retained for local consumption are kept in pits dug at the bottom of the cliffs and within the inclosure where the men keep the *trousseau* of the *bouchots*. In addition are some forty or fifty barques, making about seven hundred and fifty voyages in the year, which convey the mussels to still greater distances.

As to the question, 'Does the mussel-farm pay?' Mr Bertram furnishes the following statistics: Every *bouchot* will yield a load of mussels for each metre of its length; a load is worth six francs, and the whole farm at Esnandes 'is said to yield an annual revenue of about a million and a quarter francs, or, to speak roundly, upwards of fifty-two

thousand pounds per annum. When,' adds the writer, 'it is taken into account that this large sum of money is, as nearly as possible, a gift from nature to the inhabitants, as there is no rent to pay for the farm, no seed—as is the case at the Whitstable oyster-farm—to provide, no manure to buy, only the labour necessary for cultivation to be given, British fishermen will easily comprehend the advantages to be derived from mussel-farming.' And when, as Mr Bertram tells us, a single little fishing village in Scotland requires, for its share only, for the baiting of the deep-sea lines in the cod and haddock fisheries, close on five million mussels, it is time, we think, our British fisher-folk followed the example of their brethren at Esnandes, and set to work cultivating mussel-farms, if not for purposes of food, at least to obtain cheaply acquired bait.

TINY'S LOVERS.

IN FOUR CHAPTERS. —CHAPTER I.

'Now, now; be quiet a minute, child, and listen to me. Ah! hiff! mind! Move that cushion just a little more. No, no; the other way. Oh, hot lead and burning stones! Confound this gout!'

'Is that easier now, uncle?'

'No; it isn't easier now; you know it isn't. Eider-cushions, indeed! Stuffed with broken glass and nutshells, I believe. There; do stand out of the light, child; you're always standing in the light. No, no; now you're behind me, and I can't see you; and I know you laugh at me, when I can't see you.'

'Now, uncle, dear, that is cruel; that hurts me worse than the gout does you, I know.' This in a broken voice.

'Ah! don't touch me; don't come near me; you'll kill me! Mind my leg!' For there was something like a sob, and a pair of soft round arms were thrown round the fierce-looking old gentleman's neck, while a moist cheek was laid against his forehead, as he sat back in a great leathern easy-chair, with one leg wrapped, bandaged, and cushioned, resting upon another.

'Ha!' said the old gentleman, with a sigh of satisfaction, 'that's nicer, Tiny. What plump little arms you've got, and what soft cheeks! They're wet too,' he continued, drawing the little maiden closer to him, and tenderly kissing her. 'I've made you cry again, and I'm always making you cry.'

'No, no, uncle, darling.'

'But I am, my dear. I believe there never was such an old brute of an uncle since Noah and his family came out of the Ark, and made all the future uncles and aunts to fill the world.'

'O don't, uncle.'

'But I am a brute, my pretty one, and I say all sorts of cruel things to you when I am in agony with that leg of mine.'

'And does it hurt so very much, uncle?'

'Hurt!' exclaimed the old man, 'so very much?'

'I mean, faltered the girl, 'is it so very much worse than toothache?'

'Worse than ten thousand toothaches made boiling hot; worse than the quintessence of tic-doloureux! Ugh! just move that top cushion, Tiny; it feels like lead.'

'Why, uncle, darling, it's as light as down.'

'Yes, yes; I daresay it is, but when those twinges come— Hff! there they are again. Send for one of the keepers, child, or the bailiff, so that I can have something to swear at.'

'Dear uncle!' The young girl went to his side again, took his head upon her shoulder, leaned her cheek against his hot forehead, and gently rocked it to and fro.

'Is it so very bad now, dear?'

'Just like a leg of mutton being roasted before a slow fire without any one to give it a baste,' groaned the old man. 'There; do go away, child, or I shall begin to say cruel things to you again, and be sorry for it after.'

'Do I laugh at you when you're in pain, unky?'

'No, no, no, no!'

'You are sure?'

'I'm sure you love your old uncle dearly; but go away; I feel as if I should say all sorts of things—as if I were going to swear horribly.'

'You wouldn't swear before me, uncle,' said the girl gently.

'Shouldn't I, darling?' said the old man.

'No, uncle; and you may say all the cruel things you like, if it does you good; I won't mind.'

'But I don't want to, child. Send for one of the keepers—Simpson; I want to bully that scoundrel.'

'No, uncle; I won't send for him, now.'

'And why not?'

'Because all the men respect you so, and say you're such a good master; and I shouldn't like them to hear you say things that you would be sorry for afterwards; because, then you would go and apologise.'

'That I wouldn't,' cried the old man, grinning with pain.

'O yes, you would, uncle, dear; the same as you did to Denny, when you called him a—said he didn't speak the truth.'

'Master, indeed!' grumbled the old gentleman; 'master, grand master! Why, I'm not the master; you're the real master of the place, you puss; and a nice lot of trouble you give me. I was going to speak about it when those pains came on, and—and you wouldn't listen to me. Where's Lonsdale?'

'In the billiard-room, I think, uncle, with Captain Barry.'

'And where's Harry Lawler?'

'In the library.'

'Ugh!' grunted the old man, holding his young niece to him; 'nice state of things to come to. Here have I been a careful, saving, hard-working sailor all my life, and I buy this place, to end my days in peace, and I'm worried like this.'

'Dear uncle!' said the girl softly, as she stroked his cheek and kissed him.

'You're laughing at me then!'

'Just a little, uncle; but only at the fancied pains, not the real.'

'Oh, go it; laugh at my gout too, if you like! Wouldn't get married, I wouldn't, but lived a bachelor—'

'O uncle, I know all the story well—about how you loved mamma, and would have married her.'

'Eh, what? Why, who told you that?'

'Mamma herself, and about how nobly you behaved—'

'Hold your tongue, puss!'

'When you found she loved another, and that it was your own brother.'

'Hold your— There, there! I—I— Oh, this confounded gout again! I won't be contradicted, child; I say I wanted to be a bachelor, and—and I came home to end my days in peace, and—and, as if just out of spite, your father and mother must go and die, and leave you on my hands!'

'And should you have liked me to die too, to be out of your way, uncle?' said the girl, sinking down at the side of his chair, with her arms round him.

'Now, now, now,' he whimpered, 'that's—that's very—very cruel of you. To talk to me like that—a poor, broken old man, with nobody else left to love!'

'But you said I was a great trouble to you, uncle.'

'And so you are, my darling—a very—very great deal of trouble; but I don't mind. Tiny, my pretty one,' he said, fondling her; 'you're very hard on your poor old uncle: it's about the only indulgence I give myself, a good grumble, and you cut me very short.'

She kissed him affectionately, and fetched the newspaper to read to him.

'No, no; not now,' he said; 'I want to talk to you. I'm bothered about you, child.'

'Bothered, uncle?'

'Yes, because—because— There, hang it! the— Ugh! those twinges! Better now. Because the men want to marry you, my dear.'

'Uncle!'

'Well, you know they do. Lonsdale's been asking my permission to address you, and I told him he might, though I didn't approve of it.'

'But, uncle!'

'And then Harry Lawler must come and make the same petition.'

'O uncle!'

'Yes; O uncle indeed. And then there's that tall parson with the frock-coat down to his heels, who is always wanting you to go visiting—he means to make you the Rev. Mrs. Faushawe. And there's Hunting Jones, he's taken too. It's too bad, my dear, too bad.'

'But, uncle, darling, I can't help it.'

'Can't help it, you puss!' cried the old man indignantly. 'How dare you be so pretty, and look so enticing, you wicked little man-trap, you!'

The girl made a pretty little moue, and looked at him in the most bewitching way imaginable.

'Ah, Tiny, how wonderfully you are like your dear mother, as I knew her thirty years ago! You are wonderfully good for the gout, little one; I'm ever so much easier now.'

'Oh, I am so glad, uncle,' cried the girl, her eyes sparkling, and then growing humid.

'But now, look here,' said the old gentleman. 'I'm father and mother, and uncle and everything to you now, am I not?' and he held up one finger as he passed his arm round her shoulders.

'Yes, dear, of course.'

'Then, tell me at once—which of them is it?'

'Who is it?' said the girl, with dilating eyes.

'Yes, who is it, you—you—well, there—love, out of these fellows! for I suppose one of them will have you.'

'I only love one,' said the girl, 'and that's you, uncle.'

'Yes, yes, little one, so you do—so you do; but you care a bit for Harry Lawler?'

'O no, uncle. He always scolds me, and is cross with me about my studies, and says I waste time.'

'Well, then, the parson—Fanshawe?'

'O uncle, Mr Fanshawe is very friendly and nice, but—'

'You wouldn't like to be Mrs Fanshawe?'

'O no, uncle.'

'Very glad of it. He gives me the horrors whenever he comes into the house; seems to think smiling a grievous sin, and a hearty laugh an unpardonable offence. Bullied me for an hour one day about what he called my indiscriminate charity, because I gave coals, and blankets, and beef to the poor old folks; said I ought to place it in the hands of his society, where its application would be watched, and the charity reduced to a system. I'm very glad, my dear, it isn't the parson. Then, is it Jones?'

'Oh! dear Mr Jones, I do like him so, uncle; he's so funny.'

'Eh?' said the old man, looking grave; 'you don't mean—'

'O yes, I do, uncle: he is funny, talks about nothing but horses, dogs, foxes, and runs, from the time he comes into the house till he goes. Look here, uncle, darling, I'm going to make you laugh. This is it.' She snatched a chair to his side, sat down, folded her arms, and rested them on her knees, leaning forward, so as to bring her face into close proximity to his, and then, with her eyes twinkling with merriment, she went on: "'Well, you see, Miss Murray, we found as soon as we got to Toddy's copse, and the bounds rattled him out of cover in less than five minutes. He made off for the whins, the whole pack well laid on, the best-mounted men well up, and the ruck trailing off behind, with every likelihood of its being hellows to mend, before they were out of the big plough field.'"

'Ha, ha, ha!' roared the old gentleman. 'Yes, that's it. He nailed me for half an hour once about a run.'

'And he never talks about anything else, uncle. I believe, if he sent a present to a lady, it would be a fan made out of foxes' tails.'

'And yet,' said the old gentleman, 'you think you could love—'

'Love Mr Jones, uncle?' cried the girl, clapping her hands. 'Oh, nonsense, uncle; why, he smells of stables! I'd sooner marry Tom Harris.'

'How is poor old Tom?' said the old gentleman.

'Very bad, I'm afraid, uncle,' said the girl sadly. 'He's very old, you know. He told me yesterday he'd been in the Hall stables seventy-five years.'

'Poor old boy!' said the old gentleman. 'But look here, puss: Lonsdale—the captain? Ah! have I found you out?'

There was a rosy flush on the girl's face, and she hesitated for a moment, and then hid her face on her uncle's shoulder. 'I will be open, uncle,' she said softly; 'I think I do like Captain Lonsdale, a little—a very little.'

'I'm sorry, Tiny, sorry,' said the old man, stroking her hair, 'for, though he's my guest, I don't much like the captain. I'm afraid he's not good stuff.'

'Uncle!'

'Well, well; perhaps it's only my crabbedness, but I'm always suspicious of a man who talks so much about himself. It's very dazzling to a young girl, but there's a ring about it I don't like. I'd rather it had been Harry Lawler, child.'

'He hates me, uncle, I'm sure, because I'm so stupid.'

'Yes, pet; he hates you, like I do; so he asked my leave, like an honourable gentleman, to pay his addresses to you, while I suppose Lonsdale has been making his hay. But there; I'm sleepy and tired. Only promise me this, my pet—that you'll do nothing rashly. Don't choose in haste.'

'I don't want to choose at all, uncle, dear; and you may depend on me that I shall not be silly.'

'That's right, my darling: I know I can. Now, put a handkerchief over my face. No; that won't do: make a hole in it.'

'But it's a new handkerchief, uncle.'

'Never mind; nip a piece out: I must breathe freely, even at the cost of a handkerchief. Now, kiss the top of my head, and be off.'

The little maiden lifted the handkerchief, and kissed the bald pink forehead, dropped it again, and went silently out of the room, leaving Vice-admiral Hanley to get such repose as his gout would permit.

CHAPTER II.

While the above-narrated conversation had been going on, Captain Lonsdale, a tall, handsome officer of dragoons, with a great deal of whisker, moustache, and eyeglass, was, as has been stated, in the billiard-room with Captain Barry of the navy, an old friend of the admiral. The dragoon seemed to be enjoying himself, for the sailor was bluff, and good-temperedly submitted to being beaten again and again.

'That makes you out, I suppose?' said the sailor, as the dragoon made a clever stroke.

'Yes, and one to spare,' said Lonsdale. 'Trouble you for another sov.'

The money was paid, and the dragoon went on knocking the balls about. 'Now,' he said, 'just one more.'

'No,' said the sailor; 'I'm tired. Soon be time now for dressing.'

'Ever seen this stroke made?' said the dragoon, placing the balls in an apparently impossible position.

'No,' said the sailor; 'and I should say it couldn't be done.'

'Bet you half-sov. I do it.'

'Done!'

The stroke was made with apparent ease.

'Shouldn't have thought it possible,' said the sailor.

'Clever, isn't it?' said the dragoon. 'I'll trouble you for half a sov.'

As the money was handed over, a quiet, earnest-looking, gray-eyed young man entered the room, and took a seat, as if to watch the game. He was apparently about eight-and-twenty, certainly not good-looking, but with a thoughtful, intelligent cast of countenance that was most prepossessing.

'There's another little thing I've seen done,' said the dragoon. 'Look here. I place the balls all in a line here: the trick is to hit the farther ball without touching the one between.'

'Well, that can't be done,' said the sailor.

'Bet you half a sovereign it can.'

'Done!'

'Excuse me, Captain Barry,' said the newcomer; 'that trick is as simple as can be, and you must lose your money.'

The dragoon paused, placed his glass in his eye, and stared at the speaker with an air of the most profound astonishment. 'By Jove, sir, I didn't know that your opinion was asked!'

'It was not asked, Captain Lonsdale; but seeing through the trick, I thought it only fair to warn Captain Barry.'

'Trick? Not at all, it's skill.'

'I beg pardon, then,' said the new-comer; 'I looked upon it as a trick. By all means, then, play the stroke—with the balls lying just as they are.'

'Oh, yes,' said the sailor; 'it was a fair bet; play the stroke, by all means.'

The dragoon refixed his glass, thrust his hand into his pocket, took out a half-crown piece, and laid it in front of the second ball; the consequence of which movement would have been, that the first ball, upon being driven by the cue, would have struck the half-crown, risen in the air, leaped over number two, and descended on the other side, striking number three.

'I think I was right, then, Captain Barry; it is a trick, for the balls do not lie now as they were.'

'No, no; of course not,' said the sailor.—'I don't think that is quite plain sailing, Lonsdale, I don't, indeed.'

'As you like,' said the dragoon carelessly; and, to conceal his chagrin, he began to knock the balls savagely about, while the new-comer entered into conversation with the sailor.

A few minutes after, Captain Lonsdale placed his cue in the rack, began to hum a popular opera-bouffe air, pulled his moustache, gave his glass a most aggressive cock in his eye, stared very hard at the new-comer, and marched with imaginary spurs clinking and a big sabre under his arm, out of the room.

'A confounded cad!' he muttered; 'must have been some low billiard marker, or something of the kind; but I'll be even with him yet.'

'Poor girl!' thought the other, as he sat and saw the dragoon close the door; 'I wish she could read both our hearts.'

'Why, Mr Lawler,' said Captain Barry, 'I thought you were a regular bookworm!'

'So I am,' was the reply; and the young man's face lit up with a frank, sweet smile.

'But you play billiards!'

'I play most games,' was the reply, modestly given; 'at least, such as call for skill and thought.'

'Well, too, then, I'll be bound.'

'O no; but passably; but I have always taken an interest in getting to the bottom of things.'

'You play chess, then?'

'Yes, a little.'

'And whist?'

'Yes; I know most games—a little, and have even entered into sports, in spite of my literary leanings.'

'Oh, come, then, we'll have a game at billiards till dressing-bell.'

'With all my heart!' was the reply; and they went to the table.

'What shall we play for?' said the captain.

'Oh, for love,' was the laughing reply. 'It would not be fair to you if we had stakes.'

'Our friend the soldier did not seem to think so,' said the sailor bluffly; 'he has won about twelve pounds of me this afternoon.'

'Indeed,' said the other. 'I think it's a pity to spoil a good game by debasing it into an instru-

ment for gambling. But there; I'm preaching. How many shall I give you out of a hundred?'

'Can you give me any?'

'I'm afraid so, from what I have seen of your play. I have practised a little.'

So it seemed, from the way in which he played, which was with great skill, the result being that he won with the greatest ease, and to the extreme delight of the frank sailor.

'My dear fellow, you play splendidly. I should esteem it a great favour if you would give Lonsdale a thorough thrashing.'

'There I must ask your forbearance; I would much rather not place myself in competition with the captain.' The answer was made in so grave a tone, that Captain Barry did not press it. The dinner dressing-bell too rang, and they departed.

Some twenty minutes afterwards, when Harry Lawler descended to the drawing-room, it was to find Captain Lonsdale in an elegant attitude by the drawing-room chimney-piece, upon which he leaned as he talked to Tiny, otherwise Lydia Murray; while Mrs Rowbotham, the lady who presided over the admiral's establishment, sat upon a lounge, voluminous in black velvet. Lawler found himself almost unnoticed, for Tiny was evidently listening with great interest to some fashionable bit of chit-chat being related by the captain, who seemed to redouble his attention and *empressment* upon seeing Lawler's entry.

'A delightful change in the weather, Mr Lawler,' said Mrs Rowbotham, in a solemn voice, that seemed to have emanated from a tomb, and which, taken in connection with the black-velvet costume, suggested the possibility of the latter being a pall.

'Delightful weather,' said Lawler. 'How is the admiral?'

'Oh, most decidedly better,' said the lady. 'So well, that he insisted upon Lydia coming in to dinner. Dear girl, how attentive she has been to him!'

There was a deeper tint on Tiny's cheeks, for Mrs Rowbotham's voice rolled through the room like the tones of a loud contralto bell. Lawler said he was delighted to hear it, and seemed abstracted.

'What a flow of language your friend the captain has!' said Mrs Rowbotham, after a pause. And then, from behind her fan: 'What a couple they seem to make, don't they?'

'Yes, very,' said Lawler, still more abstractedly; for he had just glanced at Mrs Rowbotham's plump arm, upon which glittered a showy new bracelet. 'Hm!' he thought to himself, 'I see: present from the captain, to win her to his side.'

The dinner-bell rang, and the butler unclosed the door.

'Where is Captain Barry?' said Mrs Rowbotham.

'With my master, ma'am,' was the reply; and the gentleman in question joined them directly afterwards.

It was a bitter repast to Harry Lawler, in spite of its luxury, for he could not help seeing how thoroughly Tiny enjoyed the attentions of Lonsdale, who evidently felt his power, and was determined to make the best use of the opportunity. When the ladies rose to go, Harry Lawler, being nearest, intended to open the door, but Lonsdale brushed by him, and himself performed the duty, though not without causing a look of surprise to flit for an instant across the young girl's face, and

her thanks to the dragoon were certainly not of so warm a character as he anticipated.

On returning to the table, Captain Barry tried hard to make the conversation general, but it soon became evident that there was to be war between the two young men, for Lonsdale almost offensively evaded replying to a remark made by Lawler, and half-turned his chair towards the fire; and at last, in despair, the neutral visitor rose, yawned, and proposed that they should join the ladies. On reaching the drawing-room, the report was that the admiral was much better, and in a comfortable sleep, so Tiny was at liberty; and as if to make up for the slight that had, through her, been put upon one of her uncle's guests in the dining-room, she half advanced to meet Lawler, and began to talk to him about music. He was at first very cold and quiet, but in a few minutes the sweet warm enthusiasm of the girl melted his icy crust, and he began to converse with animation upon music and the great masters, till Tiny wondered how she could ever have thought him cold and strange.

'By Jove, Miss Murray,' said a voice just then, 'you haven't sung us that new French chanson; and with a smile she went to the piano, and though to Lawler there was something Eden-like in the scene, as he sat there listening to the little silvery voice which trilled forth the pleasant melody, it seemed as if a cloud had come over all, and he sighed as he saw how Tiny was once more drinking in the honeyed platitudes of the dragoon.

'She came to my side as she would had I been any other guest,' said Lawler to himself as he walked slowly into a small boudoir, whence, turning over the leaves of a book, he could see through into the drawing-room, where the bluff sailor, Captain Barry, was having a hard engagement with his own face, as he fought to avoid seeming bored by the rather inane remarks of Mrs Rowbotham, which belled and boomed through the room; while Lonsdale completely engrossed the society of Tiny Murray.

Very charming, and young and innocent she looked, as she sat there with the soft light of the great lamp falling upon her animated face, and Lawler sighed as he stood and gazed.

'I was foolish to come,' he said to himself 'very foolish. It was only a dream, and the awakening is very, very bitter. My darling—my darling!' he breathed out in a passionate sigh; 'God grant you be happy!' He let the cover of the book fall, and slowly began to move towards the other room. 'I have awakened now,' he said to himself. 'The dream is at an end, and I must face reality.'

'You will sing something, Captain Lonsdale,' Tiny was saying, as Lawler re-entered the room.

'Well, 'pon my life, I—I really'—

'O Captain Lonsdale!' chimed in Mrs Rowbotham, 'you must sing—you must, indeed. —He does sing, doesn't he, Captain Barry?'

'Well,' said the sailor, 'I think he does; I heard him practising a piece at the piano, a day or two ago.'

'There, Captain Lonsdale, I knew you could sing.'

'Well, er—er—really, you know, if you wish it, I will try,' said Lonsdale; and he glanced towards the little room, as if disposed to lower the curtains to cut off Lawler; but, to his intense disgust, there was his enemy sitting composedly in a lounge, close behind him. 'I shall never be able to sing with that confounded cad there,' he muttered; and a

savage frown crossed his face. But he threw off the feeling of annoyance, took his seat at the instrument, and sang a fashionable patter song, full of vulgarisms, each verse ending with something about Piccadilly.

Captain Lonsdale was eagerly complimented, but he did not feel satisfied; he caught a glance flying between Lawler and Tiny, and he saw the latter looked flushed and annoyed, though he would not own that it could possibly be with his singing.

'I think we ought to make Mr Lawler sing now,' said Mrs Rowbotham, as she saw him crossing the room to where Tiny was sitting.

Lawler looked at Tiny, and her eyes said *yes* as plainly as possible; so he took his seat at the piano, and played one of Mendelssohn's *Songs without Words*, in a dreamy, strange manner, which the captain considered so slow that he began to talk loudly to Mrs Rowbotham, gaining nothing, though, by the move, for Tiny quietly left her place, and, to Mrs Rowbotham's intense disgust, stood by the piano, and turned over the leaves till the player had finished the *lied*.

'She has a soul for music, after all,' thought Lawler, with a sigh, as she turned away when the last chord died out.

'I shall have to shoot that fellow,' said Lonsdale to himself, as he retired for the night. 'The cad does everything so easily. I wonder how long he is going to stay!'

'How can she care for such a man?' said Lawler to himself, as he sought his pillow, and lay thinking. 'Ah, well, woman's a riddle.'

MOTIVES.

It has been said that a good action, to be worthy of the name, must be done 'from a right motive, in the right way, and to the right end.' Perhaps few of us would care to bring our actions to so severe a test as this, however far we may agree with the sentiment expressed. And indeed great difficulty would attend our doing so, owing to the fact that our motives are for the most part mixed, or at least undefined. We may perform an act of charity, for instance, under the impulse of the moment, and without having any distinct reason in our minds why the benefit, whatever it may be, should be conferred by us on this or that particular person. It may be that we are moved by a genuine spirit of benevolence; but it is also possible that we are actuated by nothing more than a careless lavishness of money, or by a wish to get rid as quickly as possible of an obtrusive—perhaps offensive—object which is appealing to our compassion.

On the other hand, we believe that many an act of discourtesy or unkindness is done without any definable wrong motive to instigate it. 'I did not mean to be rude,' or 'I did not mean to be unkind,' are not mere childish excuses, but are applicable in many cases to children of larger growth. 'Evil' is not only 'wrought by want of thought,' but also sometimes with an apparent absence of motive which is very perplexing to the student of human nature. In the exercise of the legal profession especially, the inquiry often occurs which Dickens

puts into the mouth of Mr Wickfield (*David Copperfield*): 'The old question, you know, what's your motive in this?' Miss Trotwood, in reply, accuses him of 'always fishing for motives, when they are on the surface;' but he shakes his head incredulously, and says he feels sure it 'must be a mixed motive' which prompts her action. In this case the lawyer was at fault, for he rode his theory too hard, and learned later in life his mistake, or as he himself terms it his 'vice,' in always looking 'for some one master-motive in everybody,' and 'trying all actions by one narrow test.'

But without going so far as he did, men who belong to those professions which bring them very frequently into contact with the darker side of human nature, are often compelled to ask themselves the question, 'What could have induced him to do it?' And they seldom arrive at any satisfactory solution of the problem. There appears to be no reason, in many cases, for any ill-will against the person injured on the part of the aggressor. The insult, the blow, or whatever the offence may be, seems to have been what is so aptly termed gratuitous. There is nothing, apparently, to balance or account for it, on the other side. Nor will the theory of an uncontrollable impulse suffice to account for many an act of petty cruelty and injustice, perpetrated by those whom we should have thought, from their general character, quite incapable of them. Of course, our ignorance of a man's inner life may account to a great extent for our inability to explain the outflowings of the hidden spring, which we call his 'conduct.' But when we try to analyse our own motives we are met by a similar difficulty. We often cannot say why we took this or that course at such and such a time, why we took this or that turn in the road when another was equally open to us. All the account we can give of the matter amounts to no more than—

I do not like you, Dr Fell—
The reason why, I cannot tell.

The fact is, that in every character there are certain eccentricities which the man himself is hardly conscious of till they have blossomed into action. In one of his couplets, Archbishop Trench says:

When thou art fain to trace a map of thine own heart,

As undiscovered land set down the largest part.

And the author of *Daniel Deronda* similarly remarks: 'There is a great deal of unmapped country within us, which would have to be taken into account in an explanation of our gusts and storms.'

If this be so, what volcanoes of passion now quiescent, but not extinct—what elements of destruction or means of usefulness hitherto unused, but still available—may there be latent in that undiscovered region within! And we know how this is borne out by the fact, that men in different crises of their lives have developed qualities—almost supernaturally quick in their growth—which no one ever suspected them of possessing. They have suddenly 'come out'—to use a com-

mon but descriptive expression—'in quite a new light,' and the world has been compelled to reverse its opinion of them, and say: 'Well, we never thought he had it in him.'

And in the smaller crises of our life, the reason for our mode of action is to be sought for, perhaps oftener than we think, in some *terra incognita* of our nature, rather than in that part of 'the inner man' with which we are acquainted. Perhaps some forgotten incident of our boyhood is revived in the most unexpected manner, and we find ourselves acting, to our own surprise, almost as we would have acted thirty or forty years ago. Or, some buried wrong rises up suddenly before us, and, stung by the recollection, we are betrayed into a hasty word or deed quite foreign to our usual habits, and regretted as soon as it is said or done. At such times our old self reasserts itself, or our unknown self makes an unexpected appearance on the stage, and all unawares we act or speak—not so much without a motive, as in a manner contrary to the ordinary working of our motive-power, or as we say, 'quite unlike ourselves.'

In how many instances, if we turn our eyes away from the fruit 'to prove the inmost root,' are we humiliated to find that there is little or no reason for self-congratulation upon what, superficially, seem some of our best deeds. When we strip our actions to the bare motive, we find endless illustrations of the proverb, 'All is not gold that glitters.' Unfortunately, either from an honest fear of growing morbid or self-conscious, or more commonly from sheer idleness, there are very many who shrink from the task of analysing their motives; and the natural consequence of this is, that the undiscovered portion of themselves grows larger instead of smaller as time goes on. Occasionally it happens to such people that they are required, in giving evidence in a court of law, to answer the question, 'Why did you do this or that thing?' and it has been a matter of astonishment to many a jurymen that there should be frequently extreme difficulty in getting any satisfactory reply from the witness.

The old maxim, 'Know thyself,' has been lamentably neglected, while knowledge has in other respects so largely increased among us. The truth is that the momentum of habit is so strong, and the current in which we move so rapid, that the majority of men merge and lose much of their individuality in the general concerns of busy every-day life. Now and then, one or another is called out of his daily routine to do some special work—to face some awful danger, or meet some untried foe, and to do this by *himself*. And then it is that many a man finds out for the first time in his life of what metal he is composed—how much of dross there is, and how much of pure gold. Well for him if he come out of that ordeal a wiser, if a sadder man. In that case, one change at least will have passed over his spirit: knowing himself better than he ever did before, he will be more on his guard against his own weaknesses, and at the same time more merciful to those of others. And while he is more severely critical of the motives which actuate his own conduct, he will be less inclined to judge harshly of those which prompt the actions of his neighbour. 'There is,' says Sir Walter Scott, 'so much of base alloy in our very best (unassisted) thoughts, that it is melancholy work to criticise too closely the

motives of our most worthy actions; at least we would recommend to every one to let those of his neighbours pass current, however narrowly he may examine the purity of his own.'

FALLEN FORTUNES.

CHAPTER XL.—THE EXODUS.

WHEN an overwhelming grief befalls us, it seems for the moment, even to the humblest, to dwarf all other cares. It is only the rich, however, who can afford to indulge it. With the poor, the next day, or the day after, some miserable need pushes divine sorrow from her stool, and compels attention. Even Kate Dalton, whose sense of duty was so strong, and whose consciousness of responsibility so keen, had in the anguish of her loss underrated the more sordid troubles that were awaiting her. The cold touch of Death had numbed her somewhat to the meaner pain. But though the weight of sorrow still oppressed her sorely, she now began to feel the other burdens that pressed upon her. Lucy was gone, her wages paid to the last farthing, and her fare to town—but without any present, such as her young mistress yearned to make her; and her loss was felt, but not in gain. One month the less to feed made but small difference in the household expenses, already reduced to the most economical figure. Do what she could, Kitty found her little income did but just keep pace with her outgoings. And there were still some debts. Dr Curzon's bill—which must have grown to be a pretty long one by this time—had not yet been sent in; and Kitty dared not ask for it. Yet it seemed to her shocking, and almost sacrilegious, that what was due for medical attendance on her poor mother in those later weeks, as well as on Jenny, should not be settled. The parcel of cast-off raiment had come from Riverside, and Kitty had humbly arrayed herself in one of Mary's dresses. It was nothing more, she had said to herself, than hundreds of well-born and well-bred girls, who are not rich, are wont to do. 'You will not be offended if I send you baby's pelisse, who has grown out of all knowledge,' is a very usual thing for one mother to write to another who is her friend or relative, but happens not to be so rich in this world's goods. It is as common as Dick's old clothes being 'cut up' for his brother Jack. And it is the same, or almost the same, with other garments. Yet somehow Kitty felt it. The change from complete equality with her cousin to this state of dependence, obligation, subordination—there was no actual term for it—had been too sudden for it to be accepted yet as a matter of course.

Jenny, who had been reading about 'doles' in her old books, used to speak of these gratuitous garments as 'the Riverside dole,' and could not be persuaded to make use of them. Some of the furniture from Cardigan Place had come packed in sackings; and 'When my clothes are worn out, Margate and I are going to set to work at dressmaking with that,' she said. 'Mrs Campden will like to see me in sackcloth, I know, and it will no doubt be very becoming.'

But neither Kitty's meekness nor Jenny's mock-humility availed them in a financial point of view, even though the former affected a distaste for butcher-meat—which was essential for her delicate sister—and took to eating bread and cheese.

One afternoon Mrs Campden drove over to the Nook, and found their little dining-table spread with one chop for Jenny, and the loaf and cheese. Tony, as often happened now, had been asked to dine by the good doctor.

'Cheese is very bad for you, Kitty,' said she, taking in the situation at a glance; 'and I am afraid you will find it false economy.'

'It agrees with me very well, I thank you,' said Kitty, with the nearest approach to bitterness that her gentle nature had ever shewn.

'Well, I am glad of that; but I think a good dinner would be an excellent thing for you. If you will come home with me to-day—you and Jenny—I will send you back at night. Mary is away at the Skiptons in Eaton Square, as you know, but Mr Campden and I will do our best to make the evening pass agreeably.'

'I don't like to leave baby for so many hours, thank you,' said Kitty.

'Very well; then I won't ask Jenny to come alone, because I know she hates to be separated from you.'

'Quite right,' said Jenny; 'I do.'

It was astonishing, as Mrs Campden afterwards observed, how soon that girl had lost her manners. Some folks were always independent of mere position in that respect, but Jenny was evidently the creature of circumstances. It was only her being in ill-health that had made people imagine her to have delicate susceptibilities and so forth. Her good-breeding had been in reality but skin-deep.

If Mrs Campden, however, was severe on Jenny, she was very gracious to Kitty. 'Ah, my dear, Mary writes that Eaton Square with Leonora Skipton is not to compare with Cardigan Place and Cousin Kitty. She sticks to old friends, I promise you. I have said my say, you know, about the matter; but you can hardly imagine how Mary clings to the hope of seeing you resume your proper place in the world.'

To this Kitty replied nothing; and presently Mrs Campden took her leave, upon the whole well satisfied with her reconnaissance.

'That bread-and-cheese business can't last for ever,' said she to herself. 'Miss Kate will soon come round to common-sense, or else I am much mistaken.'

And she wrote a letter to Mr Holt that very night, bidding him be of good cheer, for that matters were working in the right direction. She had been a match-maker—having had little else to do—all her life, but she had never entered into any matrimonial plot with such gusto as in this case. The day when she saw Kitty Mrs Holt, and on which she would be able to say, 'That girl owes it all to me,' would be indeed a proud one to her. And she saw it now at no great distance.

Her visit left the two sisters, as usual, in greater despondency than it found them.

'Mrs Campden's reference to our bread and cheese was in exceedingly bad taste,' said Kitty, with unwonted indignation. 'I think you deserve great credit, Jenny, for not flying out at her.'

'My dear Kitty,' returned her sister, 'I have had my say, as Mrs Campden herself calls it, about that woman, and have made up my mind to hold my tongue. Besides, it was *your* bread and cheese, not mine. Do you suppose I don't see how you are starving yourself for my sake?' added she, with a sudden burst of tenderness.

'No, no, darling; I am doing nothing of the kind, I am all right,' sobbed Kitty. They were weeping now in each other's arms. 'It was very foolish of me to be so angry, but she was cruel to taunt us with our poverty. What can be the good of that?'

'Good?' cried Jenny, with passionate contempt. 'Do you imagine she ever thinks of "the good"? She talked like that in order to have an excuse for sending us broken victuals as well as cast-off clothes. Who cares what she says!'

'That is true. It is Uncle George's conduct that hurts me, not hers. He ought to have written, or come over, or something, after that—that letter of his wife's.'

'He is a coward; that is the long and short of it. You never shewed me that letter, Kitty; but'—

'I burnt it,' interrupted Kate.

'I know you did. I only wish to ask you one question about it. Was there anything in it insulting—I mean, disrespectful—to dear papa?'

'There was something about him, not exactly insulting'—

'I understand; you need say no more, Kitty. I suspected as much. If I had known it: well, things are best as they are; but pray, never let me meet Mrs Campden again. I will not answer for my tongue, else. The very sensation of being in that woman's neighbourhood stifles me.'

Nothing more was said on the matter; but Jenny, notwithstanding her observation that matters were best as they were, was furious at the reflection that Mrs Campden was probably under the impression that she had seen that communication to Kitty, and yet had not resented its insults to her father.

The morning after next brought two letters to the Nook, where now the postman so rarely delivered one.

'Well, Jenny, here is an invitation for us all to go to town!' cried Kitty triumphantly.

'Not from the Skiptons, surely?'

'Well, no; from nobody quite so fashionable. It is from Nurse Haywood, at Islington. Her house is vacant, it seems; and if we would only come and live there till dear papa returns—or or something turns up. Of course, we must not take advantage of the dear creature's kindness as to terms; but even if we paid her a moderate rent, it would, I do believe, be cheaper than living here.'

'May I see the letter?—Ah! then you have been writing to her to ask whether we could come, because of what I said to you the other day about my hating to be near Riverside! O Kitty, Kitty, you think of everybody but yourself! I know you would dislike living in town in such a different way to what'—

'Indeed, I should not,' interposed Kitty, flushing up. She had an objection to live in London, but it was certainly not that. She had a vague fear that Mr Holt would find opportunities of pressing his suit.

'Well, if you really wouldn't mind, Kitty, I should so prefer it. And fancy what a pleasure it will be to dear old nurse, and—Jeff!'

Kitty was silent for a little; then quietly said: 'There was a letter from Jeff, was there not?'

'Yes, darling; but as you won't shew me yours, I won't shew you mine—just yet. You are not jealous, are you?'

Either from the idea of leaving Sanbeck, or for some other reason, Jenny was for a wonder in high spirits; and these sometimes, as the phrase goes, carried her away with them.

'No, darling; I am not jealous,' answered Kitty gently; 'but I thought you told me that you liked being at the Nook because of the old books, which were so useful to you in your writing.'

'Did I, dear? Then I was talking nonsense, as I very often do.' And again she smiled. It was seldom that she did so; but when she did, the smile gave her delicate intelligent face a rare beauty, and a softness which of late it had sorely lacked.

Kitty kissed her.

'We shall have to sell all our things, Jenny, or most of them, before we can get away quite free from debt, and set up housekeeping again in London. I suppose they must be sold in Blea-barrow.'

'Very good, my dear,' answered Jenny cheerfully. 'Write to the auctioneer at once; or shall I write? I know the gentleman, for he made my reclining couch. I think I made rather a conquest of him, and he may take off that one-eighth per cent. which Jeff has got so much to talk about.'

'What a pleasure it is to see you laugh again, Jenny,' said Kitty fondly.

'And what a cheap pleasure,' answered the other gaily, 'which is a great consideration. By-the-bye,' added she, with sudden gravity, 'there is one debt we have quite forgotten, though I of all people ought to have remembered it—there is the dear old doctor's account to be settled.'

The light faded out of her face, which had once more grown bright and young; it was as though a child had suddenly been debarred from some long-promised treat.

'I have been thinking of it a great deal, Jenny. If he charges us as he ought to do, it will be a long bill—because you know there was his attendance upon dear mamma. Still, I am sure, it will be as reasonable as he can justly make it. We must sell a little more of the furniture, that's all. Nurse Haywood's house has almost everything we shall require, you know.'

'It is a dreadful thing for a poor family to have an invalid in it,' said Jenny, in a low voice; 'Mrs Campden was right there.'

'Mrs Campden is never right—at least about us,' replied Kitty decisively. 'Of course we would have you well if we could; but you are dearer to us as you are, than any one else could be in the rudest health. Now, let us set to work, Jenny, at once, since we really are going away, and forget all our invalid fancies in active employment.'

'For which I am so very useful,' said Jenny bitterly.

'There are other and better ways of being useful, my dear, than in cording boxes and carrying them up and down stairs. You can write to the auctioneer, as you suggested, for example; and you can pen a few pretty lines to the doctor, asking him to be so good as to let us know what we owe him: he will like it better coming from you than from me; and besides, you can express yourself ten times as well as I can. It is not a very agreeable task, I fear, my darling.'

'It is not worse than things you have to do yourself, Kitty, every hour of the day,' answered Jenny passionately. 'You are starving yourself—'

you are working yourself to the bone, for others; and I won't be spoilt in this way, and treated like a child; I won't indeed.'

Kitty opened her large eyes at this outburst; but before she could reply, Jenny had sat down at her mother's desk and seized a pen.

'Don't talk, please,' said she, with a sudden change from vexation to mock-gravity, 'because I am engaged in business.'

The notion of 'business' as associated with that fragile and immaterial creature was so utterly incongruous and absurd, that Kitty, whose laughter, fortunately for her, was always much nearer to her lips than the tears to her eyes, could not restrain her mirth.

Both Jenny's letters were answered promptly enough. The auctioneer came over from Bleabarrow in person, appraised the furniture, gave them a rough estimate of what it would fetch, and received his instructions. Everything was to be sold without reserve, except the piano, a few books, and some knick-knacks that had belonged to their mother.

Dr Curzon sent his reply by return of post, to the effect, that in case Mr Dalton should come home with a gold mine in his pocket, he would send them in such a bill as could not be made out without consultation with Dr Jefferson, who was an expert in that art; but otherwise that they should get no bill from him. His hand, it was true, was against every man and in every man's pocket, he said, but he did not make war against young ladies. Moreover, that such an idea had been imputed to him had given him mortal offence, which nothing but their all coming to dine with him on the ensuing day could wipe out.

This communication had a very different effect from what the writer had intended; for its recipient broke down as she read it, and gave way to a burst of tears.

Poor Jenny! The hardness of the world made her bitter, and its softness made her weak; or was it the contrast between them that affected her more than either?

But both sisters argued that Dr Curzon's bill must be paid, and they sent by Tony a few earnest yet graceful words to that effect, as well as an acceptance of the doctor's invitation.

'Your bill shall be sent in,' was the reply brought back, along with an intimation that the doctor's 'private equipage'—which was in fact the Bleabarrow fly—should be sent for them on the morrow.

Upon the whole, it was a more cheerful little dinner-party than could have been expected. Their host did not seem surprised that they were bent on leaving Saubek, though he expressed the regret which, without doubt, he felt upon his own account. Very little was spoken about the Campdens; their host was far from saying anything to widen the breach between the families; but when Kitty spoke of the annoyance which she feared the sale at Bleabarrow would cause at Riverside, he observed dryly: 'It is generally disagreeable to see folks drown, especially in shallow water; but it is less painful to some people than wetting their own clothes. At all events, I have no sympathy to spare, under such circumstances, for those upon the bank.'

Jenny said nothing, but thanked him with her eyes.

She would have been still more grateful to him had she known what happened on the morrow; how the doctor rode up to Riverside, and breaking through that neutrality which it behoves every medical man who practises in the country to maintain, had attempted to plead the Daltons' cause with Mrs Campden. He lost it, of course, and his temper with it; and in the end gave a piece of his mind to Mr Campden, who made one in the interview, and about one-tenth of one in the conversation.

His wife had observed that the Dalton girls had behaved disrespectfully to her in coming to this decision about giving up their house without consulting her. 'And as for selling their furniture in Bleabarrow, under our very noses, as it were, it is most inconsiderate and disgraceful.'

'It is ill-judged, my dear,' said Mr Campden; 'but there cannot be any disgrace in selling one's own property to pay one's debts.'

'I agree with Mrs Campden,' said the doctor, 'that it is very disgraceful.'

'There, you see; Dr Curzon agrees with me!' cried the lady triumphantly. 'He knows the circumstances, and especially his patient, Miss Jenny's character, who, you may depend upon it, is at the bottom of this. She would do anything to spite me, because I thought it right to set before her sister her true position.'

This attack on his favourite Jenny cut the last strand of the doctor's patience.

'Your wife mistakes me, Mr Campden. I think it a great disgrace that the sale should take place; but the disgrace lies at your door, not theirs. If I had your money, or one-hundredth part of it, before I would permit two helpless girls, my kinswomen, to be sold up!'—

'Insolent apothecary!' interrupted Mrs Campden shrilly, 'how dare you! You know nothing about the matter. You never had two shillings to rub against one another! My husband's money indeed! I should like to know what you would do with it?'

'Well, then, I'll tell you, madam. The very first thing I would do with it, if I were he—though it cost me fifty thousand pounds—would be, to get a divorce from my wife.' And with that the doctor clapped his hat on his head, and walked out of the house, not to enter it again for many a year.

This little scene did not tend to increase the cordiality of the tenants of Riverside towards those of the Nook. It did in fact widen the breach between them exceedingly. When the sale was over, and it wanted still a week to the time fixed for the Daltons' departure, Mrs Campden wrote a coldly civil letter to Kitty, offering the use of her carriage to take them to the station. This Kitty rightly took as a polite hint that a farewell visit to Riverside might be dispensed with, which was so far a great relief. At the same time the sense that they had been separated so soon and so utterly from those they had considered their best friends, by the bare blade of poverty, was keenly felt. She also trembled to think of the isolation that had befallen those committed to her trust. At present, however, thanks to the necessity for exertion consequent on their departure, this last consideration did not press so hard upon her; but she knew that it was, as it were, in abeyance, to become cruelly poignant when they should find themselves in the wild waste of London.

The last hour the two girls and Tony spent at Sanbeck was passed at their mother's grave. Workmen of all kinds are tardy in the country, and the pretty headstone, with its simple 'OUR MOTHER,' and the date upon it, had been only just erected. The doctor met the little pious band returning from the churchyard, and promised them that Mrs Dalton's resting-place should be henceforth his peculiar care. 'You must come down and see the flowers growing upon it, my dears,' he said. And much else he said, as welcome and as comforting; how they had yet left to them in the little valley one friend on whom they could count at all times—not very able, but good for something at a pinch, and very, very willing.

'But you have never sent that account you promised, and therefore we don't trust you,' said Kitty severely, wishing to stop Jenny's tears, which were flowing freely.

'I have brought it with me,' said he, and he gave it her. 'It is the last remembrance you will have of me, as is the case with all doctors—and now good-bye, darlings.'

He rode off on his stout pony as the Riverside carriage came thundering into the courtyard.

There were still a few minutes to spare before parting with old Margate. (The maid, more open-mouthed than ever, was to accompany them as baby's nurse and bottle-holder.) Kitty's housewifely instincts caused her to look at the total of the doctor's 'little account.'

'O Jenny!' cried she, 'what do you think that wicked old dear has done?'

'Charged us too little, of course—something ridiculously small. I know he would.'

'My dear, he has *receipted* the bill. What are we to do?'

But Jenny had already left the room, and the last box was being put on the carrier's cart.

'I really am afraid it won't do to pay Dr Curzon, Jenny,' said she, reverting to the subject when they were seated in the carriage. 'We must write him a pretty letter of thanks together, instead.'

'Yes; he will value that higher than your cheque, Kitty; God bless him!'

They did not speak much more together as they drove down the quiet valley where they had left their dear one behind them. Their hearts were too full of memories—and perhaps forebodings.

When they got into the train—a second-class carriage happened, by good fortune, to be empty—Kitty again broke silence.

'What on earth had you to say to Charles, Jenny?' (Charles was the Campdens' footman.) 'Of course, I gave something both to him and the coachman.'

'Don't be afraid, my dear, of my paying people twice over,' returned Jenny laughing. 'I assure you I mean to be as careful of my money as though I were ever so rich. I was only discharging a little debt.'

'What debt?'

'The debt we owe to Mrs Campden; that horrid ten pounds she lent us. If the doctor had taken his dues, I should have felt bound to pay them, so far as I could, out of my privy purse, since the bill was incurred on my account. But now—oh, I am so glad to have sent that woman back her ten pounds! I didn't do it insultingly, mind; I just sent a few lines as we were leaving the Nook, to thank her for the use of the carriage—for you

know she said she had sent it principally on "dear Jenny's" account—and inclosed the amount of her late loan. O dear, how nice it was! How happy I feel!'

'But, my dear Jenny, where did you get the ten pounds?'

'From here,' said Jenny, touching her forehead with her forefinger—'from here, my dear. I draw upon my imagination, and my imagination draws upon a firm in Paternoster Row which honours its cheques.'

YACHTING IN THE ARCTIC SEAS.

IN 1858 and 1859 Mr James Lamont made two yacht voyages to Spitzbergen.* The weird wonders of that little-known land took a powerful hold upon his imagination, and he was haunted by the desire to return thither, which he did. Abandoning his seat in parliament in 1868, Mr Lamont set to work to build a small vessel which should embody all arctic requirements. The *Diana*, as the vessel was called, was a three-masted schooner of two hundred and fifty-one tons, with compound engines of thirty horse-power; and in her internal arrangements a cross between a yacht and a modern Scotch whaler. She was launched in the Clyde in March 1869, and has repaid the care bestowed upon her building and outfit. For six seasons she has undergone all the vicissitudes of arctic navigation, and 'gales, ice, and even rocks have left her as stout and staunch as when she was built.' At Trömsø, Mr Lamont took on board six Norwegian seamen, experienced Spitzbergen sailors generally, but says these six Trömsönians were, 'in sea-going phrase, the *hardest bargains* he was ever shipmate with.' A gale springing up, he was compelled to seek shelter in the harbour of Vardö, an island he describes as shaped like the letter H, affording an east and west harbour. Across the middle of the letter runs the principal street, and so narrow is this bar, that 'the great forty-foot boats used in heavy fishing, when drawn up in each harbour, either meet on an antichiral axis, or thrust their huge prows in the doorways across the street.' This curious place is characterised, we learn, by immense caldrons in the outskirts of the town, in which cod livers are boiled for the European market. The fishermen, Mr Lamont says, have frequently no difficulty in securing some eighteen hundred fish each per day. Nor does he believe there is any exaggeration in the statement, that when feeding on the smaller fry (a sort of sprat, shoals of which frequent the coast in the summer months), the cod lie so thick, a stone thrown into the water sinks with difficulty, only at last slipping from the back of one fish to another, and so sinking at last to the bottom! We can easily understand, however, that under these circumstances fishing may not be unattended by difficulties; but our voyagers were anxious, with as little delay as possible, to shape their course for Novaya Zemlya, and prepare for the excitement of walrus-hunting, concerning which we have many interesting details.

* *Notes of Five Voyages of Sport and Discovery in the Neighbourhood of Spitzbergen, and Novaya Zemlya.* By James Lamont, F.G.S., F.R.G.S. Chatto and Windus, London, 1876.

In all his sporting experiences, and they have been very varied, Mr Lamont says he never saw anything to equal the excitement of a walrus-hunt. Five pairs of oars, pulled with utmost strength, make a boat seem to fly through the water; while perhaps a hundred walruses, roaring, bellowing, blowing, snorting, and splashing, make an acre of the sea all in a foam before and around her. The harpooner stands with one foot on the thwart, and the other on the front locker, with the line coiled in his right hand, and the long weapon in both hands ready balanced for a dart, while he shouts to the crew which direction to take, as he, from standing upright in the boat, has a better opportunity of seeing the walruses under water. The herd keep close together, and dive and reappear simultaneously. One moment a hundred grisly heads and long gleaming tusks are above the waves. They give one spout from their blow-holes, take one breath of fresh air, and next moment a hundred brown hemispherical backs, then a hundred pair of hind flappers, and then they are all down. On goes the boat, the sea-horses are soon up again, and then before they can draw breath the boat is in the midst of them. 'Whish! goes the harpoon; birr! goes the line over the gunwale, and a luckless junger is made fast: his bereaved mother, snorting with rage, charges the boat with flashing eyes, and receives a bullet in her brain.

We can easily understand the interest and wild excitement of such sport as this. But the cruel war of extermination which has of late years been carried on, has reduced the number of these great herds, and driven them into retreats less accessible to man. And also, Mr Lamont thinks, the instinct of self-preservation has occasioned considerable alteration in their habits; some twenty years ago, hundreds of these animals could be found and killed on shore; now, he says, a herd of walruses ashore is seldom heard of. Year by year those of them which escape the hunter retreat into more inaccessible quarters. Ten years ago, not less than a thousand walruses were annually killed around Spitzbergen; but now the numbers have greatly diminished. The commercial value of these animals is a by no means unimportant question, since, if we are to be ultimately dependent on our sportsmen for further arctic discovery, it is essential they should know in what manner they may be able to reimburse themselves for what must prove very heavy outlay. In this way, the fact of a vessel like the *Diann* being able largely to recoup her heavy expenses, has an important bearing on arctic exploration, the value of a large bull walrus being estimated at no less than twelve pounds ten shillings.

The reindeer shot in Spitzbergen were in very poor condition. This we find is always the case in these circumpolar regions in the early summer; but a few weeks of browsing on the short grass and succulent saxifrages of the slopes and valleys make an astonishing change. Through the long winter the only herbage to be found is a scanty covering of moss and lichen beneath the snow, so that the poor animals really live through several months by consuming their own fat. Naturalists have been greatly puzzled by questions as to the affinities of the reindeer of Novaya Zemlya and Spitzbergen. Mr Lamont gives it as his opinion that the reindeer of Spitzbergen

is almost identical with the wild and tame deer of Norway and Lapland, whereas the Novaya Zemlya type appears to him more allied to the reindeer of the American continent. This is a subject full of interest, and at the same time of difficulty, since the four hundred and eighty miles of stormy sea, which never freezes, which divides Spitzbergen from the North Cape, must, it would seem, form a barrier reindeer could not cross. On one occasion 'Leakhov, the Russian trader and explorer, was visiting the promontory of Swätoi-Nos, longitude a hundred and forty degrees east, lying between the mouths of the great rivers Yana and Indighirka, when he saw a large herd of reindeer coming over the Frozen Sea from the north. Their appearance, to his mind, gave substance to the shadowy reports of the Yakuts as to the existence of more land lying in that direction. With the promptness of a man whose business instincts are aroused, he set out with sledges the next month, and following the deer-tracks, discovered the group of islands known as New Siberia, at some fifty miles from the mainland.'

This circumstance suggests to Mr Lamont two points of interest as to the economy of the reindeer, their wandering habits, and their winter-quarters. And he observes: 'The instincts of this animal, as originally exhibited in both hemispheres, seem to be migratory. In spring, vast herds follow up the melting of the snow in their progress northwards for pasture. In the autumn, the first fall of snow drives them back to the shelter and herbage of the northern limit of trees. It may therefore be assumed that the existence of reindeer in Spitzbergen and Novaya Zemlya and other isolated lands where ordinary yearly migration is difficult or impossible, is an accidental circumstance; in other words, that the reindeer is not indigenous to districts compelling him to live months' starvation. It may further be taken for granted, that the accidental element, whether of deer wandering out of their reckoning on continuous lands or adjacent islands, or of unusual states of ice bridging across areas of part land part water, may recur yearly, or at intervals of years. If this were the case, we should expect to meet in Spitzbergen not only with the descendants of the first chance inhabitants, but also with those brought thither by a recurrence of favourable circumstances.'

Again, he argues, did we meet with characteristics peculiar to the reindeer of one known district, we might reasonably infer that the deer of Spitzbergen, for example, must have journeyed by a route unknown to us from that district. Now, he says, we do find in Spitzbergen reindeer unlike in horns and general proportion to those of Novaya Zemlya, or the variety hunted by the Eskimo of Greenland and North America, but, on the other hand, approaching very closely in type the tame deer used by the nomad tribes of Northern Europe and Asia. The inference he draws from this is, that the reindeer pass over ice and intermediate frozen lands to Spitzbergen, from a point of the continent of Asia almost exactly opposite in a straight line across the Pole, and that this is susceptible of strong confirmation by some remarkable facts which have come under his own notice in his frequent visits to Spitzbergen. One of the most curious of these is the peculiar *ear-marks* found upon some of the old stags. These, he says, consist

of decided 'crops and half-cuts,' similar to those given by a Scotch shepherd to his sheep. Spitzbergen skippers say they have killed hundreds of deer with ear-marks, which they account for by saying 'these deer must have come by some unknown connecting islands from Samoyede Land.'

Again, Mr Lamont says, large numbers of tame reindeer stray away from Eastern Siberia, which are said to go over the ice, and are never heard of again. From this and much more evidence to the same purpose, he concludes there is a strong chain of evidence pointing to the existence of a continent, or tracts of land separated by no great widths of channel, stretching from the neighbourhood of Eastern Siberia across the Pole to Eastern Spitzbergen. But whether Plover Land (north-west of Behring's Strait)—an undefined unexplored district, the newly discovered Franz-Joseph's Land already traced to within sixty miles of Gillis Land, and Gillis Land itself, are parts of this hypothetical continent or archipelago, he says he will not attempt to prove, though he could adduce much evidence in favour of such a theory.

Had shooting deer or hunting walrus been Mr Lamont's only object, he says he might have had splendid sport by remaining in Novaya Zemlya, but 'making a voyage in the first steamer that had visited this part of the arctic seas,' he considered it his 'first duty to prove that steam could carry them where sailing-vessels were unable to go.' This, he says, kept him ever hammering at the ice, and prevented his making the voyage remunerative in a sporting point of view. But it was rich in pleasure, and in the increase of knowledge which comes of careful observation. For instance, his intimate acquaintance with the enormous glaciers of Spitzbergen has enabled him to solve a difficulty which often presented itself to him in the Highlands of Scotland, where he frequently noticed the vast accumulations of earth and gravel, for whose origin he could not account. He has no longer, he says, any hesitation in believing these mounds to be 'the lateral and terminal moraines of ancient glaciers, which filled the glens in times when the climate and aspect of Scotland must have been very analogous to that of Spitzbergen at the present day; when perhaps the seal and the walrus sunned themselves (fearless of harpoons and conical bullets) on fields of ice, drifting about amongst a wintry archipelago of barren islands, and sought their food on submarine banks, now fertile land rented at five pounds an acre.' In confirmation of this belief, he adds: 'The shells, those insignificant but yet powerful exponents of the past, shew that this is more than mere hypothesis, for many shells of mollusca now inhabiting the arctic seas, although no longer found alive in British waters, are dug up in large quantities in the pleistocene beds in some parts of Scotland, and particularly in my own immediate neighbourhood, at Ballinakielly Bay, in the island of Bute.'

Notwithstanding all drawbacks in the way of unforeseen hardships and privations, arctic wanderings have a charm only the initiated know. Those wild wintry wastes, with their weird grandeur and exciting sport, have a fascination strong enough to make men like Mr Lamont regret that the ten best years of his life, spent in Greece, Turkey, and Africa, the West Indies, Paris, Rome, Naples, on the brown moors of Scot-

land, or within the walls of the House of Commons, had not all been passed amid the wild pleasures and daring deeds which make up the sum of arctic life.

A LITTLE ABOUT MANGANESE AND ITS USES.

It is very strange how little one part of the world knows of how the other gets its living. This is no new saying, I know very well, but it is a very true one. Now, for instance, how many people know anything about manganese? and yet the immense quantities imported into Great Britain must give employment to a great many. In one year, fifty thousand tons were brought into this country, and thirty thousand were used on the continent. The ore itself is most variable in appearance; sometimes it is dark-brown, other times blue-black, and then again it is found in beautiful crystallised masses. The principal supply comes from the south of Spain and Portugal, where it is found amongst the mountains in what are called 'pockets'

a miner's phrase for a detached mass of ore—which may vary in size from a few tons to several hundred. Very often it is found on the surface of the ground, and it is seldom that it is met with at a greater depth than ninety feet.

Manganese, unlike other minerals, seems to follow no rule, so that the most experienced mining engineers are often at a loss to know whether the ore exists in certain places or not; the men who know best where to find it are the miners who work in it every day. As these men are totally ignorant of science, they, of course, do not stop to think whether the ore ought to be there or not; but recalling their experience, are seldom wrong, and seem to know by instinct where the ore is. After the ore is got out of the ground, it is roughly sorted from the pieces of rock in which it is found, and then piled in baskets on mules' backs, when it is taken to the nearest water, which is sometimes a long distance off; there it is washed in sieves by the women and children, after which the ore is properly sorted according to quality, for it varies as much in this as in appearance. Here, again, it is strange how clever the sorters are at knowing the different kinds: to a stranger they all look alike; but the poor women know the various grades as well as any clever chemist.

When the ore is ready it is again put into baskets on mules' backs, and taken to the nearest seaport, or railway station, either of which is frequently many miles distant. There are no roads from the mines along which carts could go, so this is the only way in which the ore can be transported.

In Spain the charge for carrying it is about a real (twopence-halfpenny) a hundredweight per league. How would our labourers in England like to carry ore for so many miles for so low a wage?

In spite of all that has been said of Spanish indolence, the poorer classes are steady, industrious workers: they begin working at sunrise, and work till sunset, with an interval of two hours in the middle of the day for the siesta, which is very necessary in that hot, shadeless country, where they are exposed to the full glare of the sun all day. The only holidays they get are on saints' days, for Sunday is like any other day there; but it

must be borne in mind that saints' days occur rather frequently. The men get about two shillings a day wages, and the women and children from eightpence to one shilling. Very young children are employed, some of them not being eight years old.

As a rule, the mines are very quiet, orderly places, where quarrels are all but unknown. The 'truck' system, which used to be so well known in many parts of England, is in full vogue in Spain; every little village—and there is nearly always one near a large mine—has its *almacen*, or general shop, at which the workmen have to purchase all they want; they do not pay ready-money, but tell the *almacenista*, or master, how many days they have worked, when he, as he well knows what wages they get, credits them with a certain amount of goods. At the end of the month the *almacenista* presents his account to the manager of the mine; and the balance, if there is any money over, is given to the worker.

This system—as has been found in England—is very injurious in its working. By an agreement with the manager of the mine, to whom the *almacenista* pays a certain percentage, no one else is allowed to open a shop near the mine; so there is no opposition, and he can charge what he likes for his goods. Still, the people are so accustomed to this system, that it is doubtful whether they would give it up if they could.

Manganese is met with in considerable quantities in the north of Spain, but during the late unfortunate war none of it was exported. Large quantities were, however, met with in the south of Portugal, which are now being extensively worked, the mines being managed in precisely the same manner as in Spain. In England too, in the county of Devonshire, are mines of manganese of excellent quality; and it is occasionally met with in Wales.

Germany used to supply a great deal of this ore, but owing to its poor quality, it has been almost entirely superseded by the Spanish and Portuguese, which, so far, is the best which has been found.

Besides these sources of supply, shipments of ore have been made from California, Virginia, and New Zealand; but at present, the supply from these last-named countries is very limited, owing to the difficulty of getting a freight low enough to make it remunerative.

Recent reports shew that large deposits of manganese exist in the Cape of Good Hope, and the specimens of it which have been sent to England to be tested, shew it to be of excellent quality.

In many of the manganese workings in the south of Spain, abundant evidence exists that this ore was worked by the ancients; and it is supposed that the celebrated Toledo blades owed their peculiar qualities to the presence of manganese in the iron ores from which they were made; and one of the uses to which it is being put in this country is in the manufacture of steel by the Bessemer process. But the principal use for manganese now is in the manufacture of bleaching-powder, or chloride of lime, which, as every one knows, is a powerful disinfectant, and extensively used in making paper, bleaching calicoes, &c.

Manganese ore, or, more chemically speaking, the peroxide of manganese, possesses the peculiar quality of decomposing hydrochloric acid into water and chlorine gas, a quality possessed by no

other ore in such a high degree. The ore is crushed to about the size of walnuts, and put into large stone stills; the hydrochloric acid is then poured on to it, and steam is blown into the mixture, when the chlorine gas begins to evolve, and is then conducted into suitable leaden chambers, where it is absorbed by lime laid ready to receive it, which, when sufficiently saturated with the gas, forms the bleaching-powder of commerce. A singular property of the ore is, that the refuse left in the stills, which is known as chloride of manganese, can be again utilised by the proper admixture of lime with air forced through it, when it is reconverted into peroxide of manganese, and is ready again to do its work. In many of the leading chemical works, this process of recovering the manganese is carried on under the name of 'Weldon's process.'

Spanish manganese is considered the best for making bleaching-powder, owing to the facility with which it dissolves in the acid, many other ores being, although of as high a percentage, of too dense a nature to melt readily; for the real commercial value of the ore depends upon the amount of available oxygen it contains. At one time, owing to the enormous chemical trade of this country, it became a serious question, from whence the manufacturers could draw sufficient supplies of manganese, when the discovery of Weldon's process of recovering it helped them out of their difficulty; this being another illustration that 'Necessity is the mother of invention.'

But manganese is used for many other things besides the manufacture of bleaching-powder. In making steel, it is employed to remove any impurities that may exist in the iron, and it is found to wonderfully improve it, and add to its ductility; and iron ores which contain a small quantity of manganese are eagerly sought after, and command high prices. In disinfecting fluids, of which we may take Cond's as an example, manganese is the principal constituent, giving to the fluid its beautiful pink colour.

Manganese is used in glass-works to remove any impurities in the glass, and make it clear and in proper proportions; it gives the amethyst colour so often seen in stained-glass windows. The black china which has become so fashionable, owes its colour to this ore; and many of the tiles for our floors are made with the same material. In the laboratory the chemist employs it, when mixed with chlorate of potash, as a ready means of obtaining oxygen; and in metallurgical operations, it is found to be a very useful flux.

From experiments that have been tried in Belgium, it has been proposed to bring manganese into use for the manufacture of gas for lighting purposes, owing to the oxygen it contains, and the property it possesses of, under certain conditions, reabsorbing oxygen from the air. This is an experiment which will be watched with the greatest interest by all scientific men. There is no doubt that all the uses to which manganese could be put are not yet exhausted, as fresh discoveries are continually being made; but this latest one, of making artificial light, will be the most interesting to the general public, as the means of obtaining light concerns every one.

LAMBERT, THE 'HERO AND MARTYR.'

AN interesting jury-trial concerning copyright lately took place in the Court of Session, Scotland. The complainer was Charles Reade, D.C.L., an eminent literary man in London; the defenders were George Outram & Co., printers and publishers of the *Glasgow Herald* newspaper. The complaint was substantially this: Mr Reade had written a story styled 'A Hero and a Martyr,' which, while retaining the copyright, he gave to be printed for a proper consideration in the *Pall Mall Gazette*. Without leave asked, or any communication whatever, the *Glasgow Herald* copied the story; and this was an action for damages on the score of an invasion of copyright. There could be no doubt as to the extreme impropriety of so copying the story. The publishers of the *Herald* were clearly in the wrong. Floating news may be freely copied by one newspaper from another, but not a story or narrative valuable in a literary point of view. The justice of the complaint being recognised by the court, the jury assessed the damages at ninety pounds.

We should not have mentioned the case but for the special purpose of calling the attention of our readers to the character and present condition of the hero and martyr who forms the subject of the story. The story, in its leading features, is no fiction, but a true account of a frail and blind old man in Glasgow, named James Lambert, who is noted for having saved numerous persons from drowning. In the *Scotman* newspaper, issued a few days after the trial, Mr Reade tells this poor man's history in the following brief and touching manner.

"There is an old man in Glasgow who has saved more than forty lives in the Clyde, many of them with great peril to his own. Death has lately removed a French hero, who was his rival, and James Lambert now stands alone in Europe. The Frenchman saved more lives than Lambert, but then he did most of his good work with a boat and saving gear. The Scot had nothing but his own active body, his rare power of suspending the breath, and his lion heart. Two of his feats far

surpass anything recorded of his French competitor: he was upset in a boat with many companions, seized and dragged to the bottom, yet contrived to save them nearly all; and on another occasion, when the ice had broken under a man, and the tide had sucked him under to a distance of several yards, James Lambert dived under the ice, and groped for the man till he was nearly breathless, and dragged him back to the hole, and all but died in saving him. Were the chances were nine to one against his ever finding that small aperture again, and coming out alive. Superior in daring to his one European rival, he has yet another title to the sympathy of mankind: he is blind; and not by any irrelevant accident, but in consequence of his heroism and his goodness. As this matter was inadvertently misstated the other day in the course of the trial "Reade v. Outram & Co.," I will be the more exact. He was working at a furnace one wintry day, and perspiring freely. The cry got up that a man was drowning. He flung himself, all heated as he was, into icy water, and when he came out he lost his sight for a time on the very bank. His sight returned; but ever after that day he was subject to similar seizures. They became more frequent, and the intervals of sight more rare, until the darkness settled down, and the light retired for ever.

"The meaning of the word "martyr" is—a man who is punished for a great virtue by a great calamity. Every martyr in Foxe's book, or Butler's, or the *Acta Sanctorum*, or the *Vite Patrum Occidentis*, comes under that definition; but not more so than James Lambert: and the hero who risks his life in saving, is just as much a hero as he who risks his life in killing, his fellow-creatures. Therefore I do not force nor pervert words, but weigh them well, when I call James Lambert what he is—a hero and a martyr. That is a great deal to say of any one man; for all of us who are really men or women, and not, as Lambert once said to me, "mere broom-besoms in the name o' men," admire a hero, and pity a martyr, alive or dead.

'So, then, the Frenchman I have mentioned had one great title to sympathy, whereas Lambert has two; and this is how France treated her heroic son: He lived at the public expense, but free as air. The public benefactor was not locked up and hidden from the public. His breast was emblazoned with medals, and amongst them shone the great national order the Cross of the Legion of Honour, which many distinguished noblemen and gentlemen have sighed for in vain; and when he walked abroad every gentleman in the country doffed his hat to him. Thus does France treat a great saviour of human lives. James Lambert lives at the public expense, but not as that Frenchman lived. It grieves my heart to say it; but the truth is, James Lambert lives unhappily. He is in an almshouse, which partakes of the character of a prison. It is a gloomy, austere place, and that class of inmates to which he belongs are not allowed to cross the threshold upon their own business, except once in a fortnight. But to ardent spirits loss of liberty is misery. Meanly clad, poorly fed, well imprisoned, and little respected—such is the condition of James Lambert in Glasgow, his native city. Yet he is the greatest man in that city, and probably the only man now living in it whose name will ring in history a hundred years hence—the greatest saviour of lives in Europe; a man whose name is even now honoured in India and Australia, in the United States and Canada, and indeed from the rising to the setting sun, thanks to his own merit, the power of the pen, and the circulation of the press—a true hero, and a true martyr, glorious by his deeds and sacred by his calamity. Shall this great public benefactor, afflicted by Heaven, and his days in obscure unhappiness, when men can help it? Shall he be left in the hands of a local charity, which despises those it benefits, and lets them see it? Shall he be hidden from the public, when such men are the greatest human ornaments in the streets of any city? I propose, on the contrary, that we endeavour to rise to the intellectual and moral level of France in this case. Let the public deal direct with this public benefactor, and in a manner creditable to the public. Let us do our own duty for once, and take him into our own hands.

'I ask the nobility, gentry, and commonalty of Scotland to enable me to buy this man a small government annuity of 15s. per week. The whole sum required for this is, I believe, £400. But nothing like that sum is now asked by me. I raised a subscription for the purpose in England some time ago, and there is more than £200 lying at my bankers [Herries & Co., 16 St James Street] under an account entitled the "Lambert Fund." Moreover, the Court of Session has just awarded me a sum of damages in a case which has got mixed with this, and whatever balance may come to me after payment of the costs will be transferred to the Lambert Fund, and go to reduce the sum now required.

My whole scheme is to purchase the annuity for trustees, who will undertake to disburse it weekly to James Lambert for the remainder of his days. Of course, I cannot take any personal part in this arrangement. I live in London; and do not expect to live so long as James Lambert, though he is my senior. But I am quite sure I shall find men of high position in Glasgow who will undertake that the disbursement shall be weekly, and that neither the imprudence which may be expected from a hero who goes under the ice after so ungrateful a thing as a man, nor the ill example of false friends, may defeat the benevolence of an intelligent and grateful public.'

We have done what is in our power to give publicity to the benevolent appeal made by Mr Reade on behalf of the poor and deserving old man; and will be glad to hand over any sum intrusted to us to the 'Lambert Fund.' The success of the appeal cannot, we think, be doubtful. W. C.

FALLEN FORTUNES.

CHAPTER XLII.—THE SWING OF THE PENDULUM.

LIFE is not all sorrow even to the sorrowful. There are hours when the sick are well, when the toilers are enfranchised, when the poor are wealthy. It may be that they only seem so by comparison with their usual lot (for has not happiness been defined by a sad sage as freedom from pain?); yet they *are* happy; buoyant, thankful, believing for a little while that the sun shines for them as well as for others; that Fate is not, after all, so hard. Thus it was with the two sisters as they sat together in the railway carriage, the one disclosing, the other drinking in, the details of a literary success.

The baby was asleep, and Tony was endeavouring to teach the open-mouthed maid the rudiments of travelling piquet. She would count the sheep per head instead of per flock, and in doing so missed the magpies, the donkeys, and all that was really valuable upon her side of the way.

'This news is wonderful, dear Jenny,' cried Kitty admiringly. 'The idea of your being a real live author! I thought that you had some idea of getting money by your lace-work; and so did dear mamma. We used to talk about it together, though we never spoke of it to you, and she used to tremble so lest you should meet with some disappointment. She said people would not think so much of your lace, beautiful as it was, when they had to pay for it.'

'She was right, Kitty. I failed in the lace-line; I thought I would try literature.'

'Extraordinary!' murmured Kitty, overcome with the audacity of this idea.

'Yes, my dear, I said to myself: "I will be an author." You know I was always fond of scribbling. I suppose I had written as much as Shakespeare from first to last; though there was a considerable difference in the quality.'

'Don't let us say that,' said Kitty encouragingly.

'Well, other people said it, my dear (or the equivalent of it), at all events: editors especially.'

'Editors! You write to editors, then?' Kitty regarded her sister with a sublime surprise—an admiration tinged with awe.

'Why, no; I got Jeff to take the things, and to offer them as though they were his own productions.'

'Jeff! You made poor Jeff pretend to be an author! But how could he?'

'He went to work as naturally as possible. He gave them tragedy, comedy, melodrama, and sentimental effusions; but no one ever expressed a doubt.'

'How charming!' exclaimed Kitty, clapping her hands together in joyful excitement. 'And they were all accepted, of course?'

'No, dear; they were all rejected. The editors told Jeff that he must have patience, and "fill his basket." (The expression puzzled him a good deal, by-the-bye; he said he had only heard of one's "bread-basket;" and how was an author to fill that, if he could not sell his works.) He was to read more, they meant, and not attempt to spin things out of himself, like a spider. You shall read Jeff's description of it all some day. So I set to work upon Mr Landell's library. It was rather dry work at first; but I ferreted out some curious and out-of-the-way things, and made two articles out of them, and told Jeff to try his fortune with them with the *Smellfungus Magazine*. And the editor actually accepted them.'

'Only to think of it, Jenny. Then you were in print. And yet you never told us! How could you keep such a secret, and oh, Jenny, from dear mamma too, whom it would have pleased so much!'

'I have often thought of that, dear,' answered the other gravely; 'but it does not matter now. What I had set my heart on was to get money for us all - to show that I was not going to be the clog and the burden to you that - that woman at Riverside took it for granted I should be. And since for those articles I got no money, I determined to say nothing about them. But Jeff - dear Jeff - so managed it that for a story I wrote, all out of these old materials, I did get money. The day you heard from Nurse Haywood, he sent me two five-pound notes from the editor. I should have given them to you at once, only you spoke of Dr Curzon's bill, and I thought they ought to go for that. Even so, it would have been very nice: but as it is - to have paid Mrs Campden off with them - it is simply delicious! We are out of debt, and we shall have the means of livelihood. This was "the hope" that I told that woman we still had, and at which you smiled so sadly, when she came to call that day at the Nook: the hope of my being able to make money by my pen; and you see it has been realised. It is not such a bad world, after all; if only dear papa comes home to us. I think he will come now; I do indeed. Everything looks so much brighter, though I thought we were never to have a ray of sunshine again. Kiss me, Kitty.'

The two girls sat locked in a close embrace.

'But, Jenny, why did you let us leave Sanbeck? You will no longer have any books to - to -'

'To "gut." That was the word the editor used to Jeff, little knowing that he was giving advice to a lady. He said that at the British Museum I should find any amount of old books to - to perform that

operation upon. It seems I have a talent for evisceration.'

'I daresay,' said Kitty confidently, 'though I don't know what it means. It seems to me you have a talent for everything. Oh, you dear, clever creature!' cried she, holding her at arm's-length, 'I declare I feel quite afraid of you; I shall never dare scold you again.'

In the exuberance of her admiration, Kitty must needs confide the fact of Jenny's authorship to Tony, but without awakening the like enthusiasm, for that gentleman being deep in his game of travelling piquet, which disinclined him to withdraw his attention from external objects, and also not being particularly interested in literary matters, only observed that 'Jenny was a stunner, and that he had always said so.' And if he had been informed that she had been made editress of the *Quarterly Review* or *Punch*, or both, he would probably have made the same observation.

This philosophy upon Tony's part, with which Kitty was herself inclined to quarrel, amused Jenny exceedingly, and for an hour or two she continued in the highest spirits. Then the long travel and comparative discomfort of the carriage began to tell upon her feeble frame; she grew pale with pain and weariness, then sick and faint. They were fortunately still alone, and all was done for her in the way of affectionate tendance that could be done. Kitty was not one of those young ladies who associate faintness with immediate dissolution, and are frightened out of their small wits on beholding an attack of illness; but she felt with anguish that the improvement which was hoped had taken place of late in her sister's health must have been less real than apparent. Perhaps those very attempts to procure money by her pen over which they had just been so sanguine, had exhausted and enfeebled her. At this thought the momentary sunshine in poor Kitty's heart was quite extinguished, and the clouds that covered it were darker than those it had dispelled. What were a few pounds earned now and again, when set against the cost of Jenny's life! As the light faded out from the short winter's day, and she sat with Jenny's aching head pillowed on her breast, and with the baby's feeble moan in her ears, she was filled with sad forebodings; strange thoughts of self-sacrifice and self-negation, which had for a time grown unfamiliar to her, retook possession of her brain, and turned her cold - as cold, but as steady, as a statue. As the whistle sounded and the train plunged into the last tunnel, she pictured to herself her last return from Riverside, alone, when Jenny and her mother had come to meet her at the station and take her home. Now there was no mother, nor any home that could be called such; and none to meet, or -

'Kitty! Jenny! - there's Jeff!' cried Tony excitedly, as the carriage rolled into the gas-lit station. And in another moment Jeff's hand was on the door, and his bright face smiled through the window-pane as he ran beside the still moving train.

How glad, and yet how sad, Kitty felt to see him: glad upon her sister's account, to whom she could now entirely devote herself, while Jeff looked after the baggage; but sad upon her own, for somehow his presence scattered and broke down those 'low beginnings of content' she had begun to feel in that scheme of self-sacrifice which

she had just now been painfully elaborating. Oh, why had he come with his kind tones and tender eyes, ere yet her mind had had time to harden in its mould of duty!

'Jenny is very tired, Jeff,' was all her greeting to him, except the thankful pressure of her fingers.

'Of course she is,' returned he cheerfully. 'How could it be otherwise after such a journey! I have got a brougham for her, so that she should not be jolted quite to pieces. So get you into it, you three folks and a half; and I will follow with Tony and the baggage in a four-wheeler.'

'A brougham!' sighed Jenny, looking more dead than alive. 'I call that a wasteful extravagance.'

'Pooh, pooh!' he whispered; 'distinguished authoresses don't ride about in hack-carriages in London, let me tell you, whatever they may do in Saubeck.'

No further expostulation was made, for indeed nothing could have been more welcome to poor Jenny's back and limbs than the cushions of the vehicle in question, which Jeff had had supplemental for her especial use. She felt positively better on her arrival in Brown Street, after their long drive through misnamed 'Merry Islington'—the dullest and drabdest of all suburbs than when she had left the train. She had been as eloquent about Jeff's thought and kindness on the way, as her feeble voice would permit her to be; but Kitty had answered nothing. She knew how tender and how true he was, and dared not trust herself to praise him. To her great relief, he did not present himself that night in Brown Street, but left the little family to 'settle down' in their new dwelling alone. If it was not 'like home,' it was very unlike what ordinary lodgings would have been; instead of the smiles of a mercenary landlady, there was the honest kind face of Nurse Haywood to give them welcome. It would not have beamed half so brightly had they been rich folks who had agreed 'for six months certain' at treble the rent; for she loved 'the young ladies' as though they had been her own children, and thought them the most beautiful and charming of God's creatures. 'Master Tony' had always been her especial darling; and the baby she regarded as a precious and sacred charge bequeathed by its sainted mother to the world, in compensation for her departure heavenward.

Kitty always used to assert that Nurse Haywood was 'a lady,' and looking at her with her neat gray hair and gentle, quiet face, as she stood dressed in her new black silk, to welcome the bereaved ones, you would have indorsed that opinion. She wore a certain gold watch and chain a little ostentatiously, to be sure, in the front of her dress, but then these had been given her by Mr Dalton's own hand, and she wished to shew herself mindful of him. Her face, like her person, was plump, and, notwithstanding her advanced years, quite free from wrinkles; and if her voice was somewhat broken, it was not through age, but because, though old, she had retained all her sympathies and affections (the more easily, perhaps, that they were within narrow limits), and was sadly 'upset' at the sight of her dear ones. It was their trouble that troubled her; and her chief care and fear were that, accustomed as they were, as she expressed it, 'to the best of everything,' the

accommodation she had to offer them in Brown Street would seem miserable and insufficient.

The sight of Jenny, so wan and travel-worn, utterly overcame her, and she could only exclaim, 'My poor, poor lamb!' as she folded her to her heart.

Truly the 'wind was tempered' to her and to all the shorn flock in that hospitable dwelling. It was humble, yet, as Kitty shrewdly suspected, by no means so low-rented as the price Nurse Haywood had charged them. They would be none the less a burden on their old friend, because she would bear it like a feather; and if it lasted long, how could she bear it! However, she drove those thoughts away, and for the present resolved to feel only thankfulness. After the nice little supper, at which Tony greatly distinguished himself, and which she herself did her best to swallow, lest her hostess should ascribe her want of appetite to fastidiousness; and after she had seen the rest of the party stowed away in their small dormitories, and Jenny dead-tired had fallen asleep, Kitty sat down in her room, over an unaccustomed fire, to cast up the expenses of the day. Accounts had of old been hateful to her, but now she found a refuge in them from thought. Their dry details shut out alike reflection on the past and forebodings for the future.

Scarcely had she begun, however, when there was a gentle knock at the door, and there entered Nurse Haywood.

'Now, my dear Miss Kitty,' said she, perceiving the nature of her occupation, 'why on earth are you a-worrying yourself about pounds and shillings, instead of getting ready for your bed, which, Heaven knows, you must want enough?'

'But, my dear nurse,' answered Kitty, smiling, 'I must needs look after not only pounds and shillings now, but shillings and pence. You have endeavoured to spoil us, as usual, with all sorts of luxuries; this fire in my bedroom, for one. But, indeed, you must not go on so. I told you in my letter how very different things were with us, remember.'

'I know that; and the more shame to them as have brought it about.' Nurse Haywood firmly believed that the Daltons' misfortunes had been caused by some wicked human agency, assisted by the more or less direct assistance of the Devil. 'But you have no call to fash yourself with money-matters yet a while. There's near upon a hundred pounds, my dear, in the savings-bank, which is yours if it is anybody's, Heaven knows, since it was all saved in your service.'

'Nurse, nurse, don't talk like that!' cried Kitty, breaking down in spite of herself. 'Do you think we have come here to live upon your savings?'

'You are come here to be comfortable, and not to worrit,' returned the old dame decisively. 'Your dear papa will be home soon, please God; and a pretty thing it will be if he finds you have been denying yourself things in my house. And even if he don't come back, do you suppose you have no friends?'

'None but you, dear nurse; except one or two who have all the will indeed, but not the power to serve us.'

'Well, I don't know; gentlemen who ride on horseback with their groom behind them have generally money to spare; and one such at least has been here to-day to ask after you all. A more

civil-spoken gentleman, or who shewed himself more kindly towards you all, it is not easy to picture.'

'What was the gentleman's name? Was it Sir William Skipton?'

'Very like, miss. He might have been all that, to judge by his hat and boots, which you might have seen yourself in, just as in that looking-glass. He didn't leave his name; but he said he was a friend of your father's—which went to my heart at once, as you may credit. And he asked after you all, one by one, down to the sweet baby. He thought you had come yesterday, it seems, and called to inquire how you all were after your long journey.'

'Was he a little man with gray whiskers?'

'O no, Miss Kitty: he was a tall, fine-looking gentleman, rather stiffish, I should have said, if he had not been so affable. I am sure he is a friend of yours, whoever isn't.—But what I came up to say was that here is a letter for you, as came by the last post to-day, but which the sight of your sweet faces put clean out of my old head till now. I thought I'd bring it up—else you had much better not read it to-night—in case it was anything about—about your dear papa.'

'It is nothing about papa, I am sure,' said Kitty quietly, having cast her eye on the address. 'And I shall take your advice, nurse, and go to bed.'

She at once proceeded to put away her accounts; and after a cordial 'good-night,' the old dame withdrew. Then Kitty drew her chair to the fire, and gazed at the still closed letter with hard despairing eyes. She had recognised the handwriting; at once as that of Mr Holt; and she thought she could guess at the nature of its contents. He had called in person, it seemed, that very day, and now he had written her a letter. Fate was not only hard with her, but urgent, as though she had already tendered her submission to it.

The envelope was a large one, and held something weighty, like that she had received from Mrs Campden. Was it possible that this man had dared to send her money—bank-notes? No; thank Heaven! it was not that. There was a letter, and something official on a large piece of paper. The receipt of a premium from a life insurance office for one hundred and twenty pounds. What could it mean? The letter was of course from Mr Holt:

MY DEAR MISS DALTON In the hurry of your father's departure from England he omitted to pay his usual premium to the *Palm Branch*. As in a few days it would have been overdue, and the policy thereby have lapsed, I have taken the liberty to guard against that contingency. The money has been paid under protest—that is to say, if it should turn out—which Heaven forbid!—that your poor father should have deceased before this date, the society will repay the premium in question together with the policy of five thousand pounds. You will perceive, therefore, that I have incurred no risk, nor yourself any obligation, by this transaction, which I have only effected as a mere matter of convenience to you, and of course not without consultation with your friends.

I did myself the honour to call in Brown Street to-day, but mistook, it seems, the date of your arrival in town. Pray, make my best compliments to your sister, and remember me most

kindly to my young friend Tony. The acquaintance of the remaining member of your family I have not as yet had the pleasure to make, but I hope he bore his journey with equanimity.—Believe me, my dear Miss Dalton, yours always most faithfully,
RICHARD HOLT.

She took up the receipt again, and read it with scarlet cheek. 'Received one hundred and twenty pounds.' She was indebted, therefore, in that sum—or in nearly a whole year's income to the man who had paid it. When he wrote that no obligation had been incurred on her part, he was writing an untruth, and one which he knew could not impose upon her for a moment. The 'friends' with whom he had consulted were, of course, the Campdens, or probably only Mrs Campden. Surely 'Uncle George' could never have allowed himself to be a party to a scheme which made her this man's debtor!

She had not known the money was due. The application, in fact, had come through her father's bankers, who had been always instructed to pay it; and since there were now no funds in hand, they had forwarded it to Riverside. How hopeless would she have felt at Sanbeck, had she been aware of it; and how hopeless she felt now! Even if her father should come home to-morrow—poorer, in all probability, than he went—she would be none the less indebted to Mr Holt. Indeed, the certain news of her father's death, and the consequent payment of his policy, could alone acquit her of the pecuniary obligation, let alone any other. Oh, cruel Fate! that her only escape from an unwelcome—she dared not now say even to herself, now that the thing might come to pass, a detested—suitor, should be, as it were, over her father's corpse!

She could of course decline to receive this help at all; could object to the premium being paid at all; but then there was the contingency which Mr Holt had glanced at, of her father dying after the premium had become overdue. He might be wrecked somewhere at that moment, but still alive; and yet he might not come back alive to England. In that case his children would lose the policy: that five thousand pounds, the possession or loss of which would make all the difference to them for their lives in this world; would insure them competence, or condemn them to the poverty that one at least of them was so ill fitted to bear.

That very morning—not twelve hours ago—Kitty had been happy, hopeful, in her sister's triumph; now it seemed an age since happiness had visited her, and, moreover, that it would never visit her again. Her future looked dark indeed. The self-sacrifice she was contemplating was one which no man can estimate; there is nothing like it in the experience of his sex; for when a man marries a woman for her money, it is she, and not himself, when all is said, who in truth is sacrificed.

In many cases, indeed, such as poor Kitty's, the gilded chain soon ceases to gail; it is only a few to whom romance is necessary, and the purchased bride finds her life very tolerable; but Kitty was conscious of an obstacle to her self-abnegation, which made it ten times more hard for her, and almost a crime. In giving herself to Richard Holt, she was casting away the offer of Geoffrey

Derwent's love; and in her heart of hearts she had accepted it.

'O mother, mother!' cried she despairingly, as she turned upon her sleepless bed, 'why, why did you leave me?'

She had never felt the need of an adviser and a comforter so much as now.

GIFTS TO WAITERS AND SERVANTS.

OCCASIONALLY is to be seen, in the windows of a few dining-rooms in London, the announcement 'No fees to waiters.'

This suggests a query: Why *should* there be fees to waiters? Why should this kind of service be so set apart from all others as to require a different and unbusiness-like mode of remuneration? There is surely nothing in the labours of a waiter which renders him a special member of society! His thin shoes and his white table-napkin, his bill of fare and his bustling activity, may all be well enough in their way; but the duties certainly call for the exercise of no very remarkable amount of talent. The conventional clippings of language which sometimes amuse a visitor at the more busy of the middle-class or commercial establishments, when instructions are given out and the components of a dinner brought in—'One veal and ham;' 'two calves' head and bacons;' 'two mashed potatoes;' 'half pale ale;' 'three Cheshires;' 'two college puddings'—are not achievements which put in requisition any vast moral or intellectual power. The waiter is expected to see that the right dishes are brought to the right persons; that such requests as 'not too much done,' or 'only a little fat,' are duly attended to; that the coveted middle half of the *Times* is not retained too long by any one reader; that there is the wherewithal in the waiter's pocket to give change to anybody and everybody; and that he accounts to his employer for all the money taken. There is a story told that, at a suburban tea-garden, one waiter told another, in an agony of despair, that 'Two teas and one brandy-and-water had cut off over the palings.' Of course 'two roast porks and one apple-sauce' are not likely to evade payment in a respectable dining-room; but still the waiter will naturally be on the alert. Nothing in this, however, requires greater promptness and cleverness than are displayed by shopkeepers or shopmen.

If we give a penny, twopence, or threepence (the particular amount does not affect the question) to a waiter, why not to the servitor behind a counter? If we enter a stationer's shop and pay sixpence (say) for a quire of paper; if the shopman put on a look of expectancy which nothing less than a penny gift will satisfy—should we not deem this a strange mode of conducting business? Do the young men who supply sandwiches and ale at a luncheon bar; or the young ladies who dispense sweets at a pastry-cook's; or the spruce-looking assistants at a draper's, who sometimes have endless trouble to satisfy a fiddle-faddle customer—do these or any of these reap the harvest of a fee? If

not, why not? It is nothing to the purpose to urge that a penny is too small a matter to be contested; we all know that 'mony littles mak a mickle'; and besides, anything which is commercially clumsy ought not to be maintained as a permanent system. If the waiter receive less than he ought, he is wronged; if more than he ought, the customer is wronged; while in any case the waiter's half-muttered thanks for a *gift* involves a lowering of that independence of character which is respected by a *payment*, for services rendered.

Fees to waiters, coachmen, guards, and vails or presents to servants, rest upon the same basis; while the *pour-boire* of the French and the *trink-geld* of the Germans are analogous. Perhaps we had more abuses of the kind in England in past times than we have now. Mr Rush, when he arrived in England as ambassador from the United States, was struck with a novelty of this class. While eating his first English dinner at Portsmouth, his ears were regaled with the sound of a merry peal of bells, which he afterwards learned was intended in honour of his arrival. After dinner, he was told that the bell-ringers desired to pay their respects to him. 'Eight men,' Mr Rush tells us, in the Narrative of his Residence at the Court of London, 'with coats reaching down to their heels, hereupon entered the room. They ranged themselves one after another in a solemn line along the wall. Everything being adjusted, the spokesman at their head broke forth with the following unintelligible address. He said that they had "come with their due and customary respects to wish me joy on my safe arrival in Old England as Ambassador Extraordinary from the United States; hoping to receive from me the usual favour, such as they had received from other ambassadors, for which they had their book to shew." This book was a curiosity. It looked like a venerable heir-loom of office. There were in it the names of I know not how many ambassadors, ministers, and other functionaries, arriving from foreign parts, throughout the lapse of I know not how many ages, with the donations annexed to each!'

The custom of giving vails or presents to servants, when visitors leave a house, has considerably fallen off, although still much too prevalent; but the tradesman's bleeding, the expected gratuity to the servants of customers, still reigns in full force in the metropolis, if not elsewhere. The cook, the housemaid, the butler, the footman (especially in large establishments) consider that they have a claim upon the pockets of the tradesmen who supply the house, the gratuity being expected either at Christmas or when the bill is paid. The valet or 'gentleman's gentleman' similarly looks out for the tailor, the lady's-maid for the *modiste*, the coachman for the harness-maker and the corn-chandler, and so on. Although this may, to the eye of a looker-on, seem like a mere act of kindness to persons in a menial position, yet it is in fact paying them indirectly instead of

openly and avowedly; for there can be very little doubt that, in the long-run, the master or mistress really pays these amounts, by a corresponding increase in the charges made in the bill. The indoor servants of an establishment tax the tradesmen in this way; but the heads of the household have to run the gantlet among another list of fee-receivers or fee-beggars. The postman, the hawker, the lamplighter, the scavenger, the 'regular dustman,' the turncock—many of them (we are speaking especially of London) call for annual gratuities under the well-known designation of 'Christmas-boxes.' Systematically wending their way from house to house, in the well-to-do streets, with their books and pencils and formalities, they make an application as if it were the assertion of a right, and seem much disposed to expostulate if silver fees are not forthcoming. It would be difficult to defend this custom on any sound principle. All these men are paid for their services by the firms or companies that employ them; and if the pay is too small, that is no fault of the housekeepers. It is, in fact, a relic of the graceful and kindly old custom of mutual present-giving at Christmas; but it has lost all its grace by its one-sidedness, and by being made a matter of business—almost of compulsion. The item of Christmas-boxes has become such a large one in some of the commercial establishments of the metropolis, that there is a strong desire to frown down a custom which has degenerated into an abuse. The kindness and hospitality of a man who knows that he is well served will always find ways of shewing themselves; there is no fear that the heart or the purse would be closed by a common-sense view of this matter. Thanks to railways; they have shewn that a traveller may have a long day's journey without being pestered for fees by the servants of 'the road,' and yet obtain fully as much civility from them without any attempt to purchase it.

Hotel arrangements, except in some well-managed concerns, are vitiated by the fee system to an unsatisfactory extent. You put up at an inn or hotel for a single day, and glance at the bill just before your departure. It may contain no separate charge for servants, although you know from experience that a payment from you to them will be expected. You have to consider whether your accommodation has been in the 'coffee-room' or the 'commercial room;' whether or not you have had a 'private room;' whether you have received services from other domestics than the three functionaries familiarly known as waiter, chambermaid, and boots; and whether the establishment has the general aspect of an upper-class or middle-class hotel, or only of a 'railway inn.' All these matters you have to take into account before deciding on the amount of honorarium to set apart for the servants. A most unsatisfactory system, seeing that you seldom know when you have done enough, or whether you have done too much. If we admit the propriety of paying other people's servants (which we doubt), the bill may be drawn up by entering a separate item for 'attendance.' A traveller hereby quickly learns what his rate of expenditure would be at an inn or hotel; and different classes of establishments would be selected, to suit different purses.

But why a separate charge at all? Even the entry of 'attendance' in the bill is not always a

safeguard against uncertainty. The writer remembers an instance at an Irish hotel, where, although 'attendance' was charged in the bill, a solicitation of 'Waiter, sir,' was put forth on the ground that 'master keeps the attendance fee for himself.' Why, we repeat, a separate charge at all? If we go and purchase a hat, the hatter does not enter an item in the bill for the service of his shopman; any such item is supposed to be included in the charge for the hat, and the customer is not plagued with details with which he has no concern. And why not the hotel-keeper, the railway inn-keeper, the keepers of coffee-houses, chop-houses, and dining-rooms? If the charge for a bed be two shillings and you are expected to give an additional sixpence to the chambermaid, why not call it half-a-crown at once, and leave the master to settle with his servants? That remarkable personage 'boots,' who is expected to know everything and to be everywhere to serve everybody, may be supposed to be worth a certain annual wage or salary, which there would be no difficulty in fixing between master and man; there is no apparent reason why the master should be out of pocket by this arrangement, for his charges might be made to cover all such expenses with justice to himself and to his customers.

That such a thing can be done we have proof in some of the recently established dining-rooms in London. The conventional penny to the waiter (seldom more than a penny in the class of establishments we have now in view) is, however, in most cases still given. The clerks and warehousemen who can snatch a hasty half-hour for a mid-day meal (they are not all so lucky as to have suburban villas with a six o'clock dinner awaiting them) flock in great numbers into these establishments—thickly congregated around St Paul's, Cheapside, and Cornhill; they pay for their refectory, reasonably in most cases, and give the waiter a penny more than the charge made by the proprietor. The smallness of the fee cannot effectually hide the absurdity of the system. Waiters probably at one time received salaries in the same way as shopmen; but their masters, finding the fees amount to a good round sum, insisted on a lessening of salary, until at length matters have come to such a point that the servant pays the master (a good handsome royalty, it is understood, in flourishing establishments), and his fellow-servants besides. Many a head-waiter has saved enough money out of his accumulated fees to become an hotel proprietor on his own account. Here we come round to the same dilemma as before; if the waiter receives more than his services are worth, the public are the losers; if he receives only what they are worth, a clumsy, uncommercial system is maintained without special gain to any of the persons concerned.

We have just adverted to the sparsely adopted 'no-fee' system. Some of the City dining-rooms, well appointed and well served, have a small inclosure near the entrance where a cashier is placed to receive the money. Different modes are adopted of acquainting this cashier with the number and kinds of the good things which have constituted the refectory; he adds up the values with the quickness of an expert arithmetician, names the amount, and receives the exact sum from the diner. The waiter receives neither payment nor fees from the public for the simple duty

of bringing in and carrying out laden and unladen platters. We may safely give the proprietors credit for sufficient sagacity in laying their plans that neither cooks nor carvers, waiters nor cashiers, shall cheat them with impunity. We surmise that in some of the establishments the proprietor himself acts as cashier during the busy hours of a City day. The cashier plan is in other rooms combined with the fee plan by a penny being added to the rapidly counted sum named by the money-receiver; which penny is presumably handed over afterwards in some way to the head-waiter or amongst the waiters. But this is a distinction without a difference; the folly of the fee is still retained.

TINY'S LOVERS.

IN FOUR CHAPTERS.—CHAPTER III.

A FINE brisk late autumn morning, when they met next day at breakfast; through the great windows the golden-leaved oaks stood out russet against the sombre green of the pine-woods. The ferns were covered with gem-besprinkled cobwebs, which hung from frond to frond, all dry, brown, and crisp. The larches were of a russet yellow, amongst the feathery green spruces; and glinting in the distance, its bosom sparkling in the sun, was the great mere, dotted with green islands, bearing pines and clumps of evergreens, while in all directions wild-fowl flitted and splashed about. Now it was a flock of wild-duck, with their keenly cut swift wings, wheeling round and round, before descending with a rush to flick the water; anon it would be a flock of coots flying with a piping cry, and their feet trailing in the lake; while grebes and divers disported here and there in the pale sunshine of the passing year.

The news about the admiral was excellent, as Tiny took her place at the table, and Mrs Rowbotham, all smiles, began to dispense the tea and coffee.

'Is it to be the pheasants this morning?' said Lonsdale languidly; 'or will Miss Murray allow us to play cavalier in a ride?'

'I could not go away from the house this morning,' said Tiny; 'not till my uncle is better.'

'But he said, my dear, that you were to go out to-day,' said Mrs Rowbotham.

'Yes; uncle is very kind,' said Tiny; 'but still I should not like to be out of sight.'

'Well, look here,' said Captain Barry; 'I've been longing for days to go on the water. Let's take the guns, and try for the ducks. Miss Murray could go with us, and then we should always be in sight of the house, and a signal would bring us back. How would that do?'

'Ah! the very thing,' said the captain.

Tiny's eyes sparkled with pleasure, and the matter was soon arranged. One of the keepers was to have the boat ready in an hour, and soon after breakfast the party prepared to start.

'Not going, Lawler?' said Captain Barry. 'Come along, man; there'll be plenty of room.'

Captain Lonsdale frowned, and Lawler glanced

at Tiny, to see if she would give him ever so slight an invitation to be of the party; but no: she kept her head averted, and playfully held out her glove to the captain, that he might fasten it.

'Thanks; no,' said Lawler. 'I am going to the study.'

'See that the fellows keep up a good fire,' said the dragoon banteringly, and with a sneering laugh, directed at the young man, he followed Captain Barry and Tiny down the path that led to the lake.

'I believe I'm a fool,' said the young man, as soon as he had shut himself in the study; 'but all the same, the more I see her getting lined by that man, the harder it seems. I ought to go away, but I can't. Does she love him, I wonder?'

He took down a book from the shelves, and threw himself into a chair, rested his forehead on his hand, and tried to read, but not a word could he retain.

'I ought to have gone with them,' he said at last impatiently. 'A look would have drawn me, but she has only smiles for that man. If he were only a fine true-hearted fellow, I believe I could give her up without a murmur, and say: "God bless them both!" but with such a man as that—Oh, it's insupportable! I shall have to make some excuse, and go.'

'I hope that boat is safe,' he said to himself after a pause; and a strange feeling of uneasiness came over him. 'I wish she were back on shore. The signal would bring her, but it would only alarm her; and I should look as if I had brought her ashore on false pretences. Bah! I'm out of sorts.'

He took to walking up and down the study; went to the billiard-room, and took down a cue, but only to put it back in disgust. He was going to the drawing-room, but hearing the voice of Mrs Rowbotham, he fled in dismay back to the study.

Here the thoughts about the safety of the boat recurred to him, and, in a state of nervous fidget, he took a *lorgnette* from its case on the wall, and went into the dining-room, where he soon made out the party on the mere—distant quite a couple of miles now, and a tiny white puff of smoke told that the sport had commenced, though with what fortune he could not detect.

He stood watching them for half an hour, when they passed round a curve in the lake, and he saw them no more.

'I shall have to go,' he muttered, as he went back to replace the *lorgnette*. 'I might have finished what I wanted to read, and gone to join them, rowing myself in the skiff. I will too,' he said. 'Suppose I ring for the keeper, and get a gun. No: the very thing; I've gone out to try for pike!'

He rang the bell, and asked for the second keeper; and in half an hour, with the man to scull him about, he was fishing in the lake, and each minute lessening the distance between him and the shooting-party.

As it happened, his sole wish was to approach the other boat with a good excuse on his lips; the

fishing was a secondary consideration; but fate willed that he was to have excellent sport, and he was delayed three times to master and capture a goodly pike.

'They bes a-running well to-day, sir,' said the keeper. 'We'll go on to the deep water, where they're shooting—the big ones lie out there.' Saying which, the man rowed out in the specified direction; and again Lawler was detained, for a monster pike seized his bait, and though he played him badly, in the hope that the prey would escape, fortune was for the taking of the fish, which was gaffed at last, and hauled in triumph into the boat. 'Row straight over to the other boat now,' said Lawler.

'Haden't you better have another throw in, sir?' said the keeper.

'No; I am tired of it now,' said Lawler; and in disgust at the want of appreciation of sport on the part of his master's guest, the keeper rowed steadily after the shooting-party.

Twice over the reports of the guns told of sport, and when within three or four hundred yards, Lawler saw Captain Barry rise up and fire at a heron, which was lazily sailing by, and the bird fell, to go flapping along the water towards a reed-bed farther on.

The keeper with Lawler turned and looked as he rowed on, and then said quietly: 'I s'pose Jem Myers knows about them there posties?'

'About what posties?' said Lawler.

'Them posties just below the water, sir; he might overset the boat if he rowed atop o' one on 'em.'

'But I thought it was all deep water there.'

'So it is, sir; but the folks as was here before the admiral, sir, had what they called a pagody, sir—a Chinee summer-honse, out in the lake; and when it got old and rotten, it was took down; but they couldn't pull up the big timber posties it was built on, and there's two or three left now.'

'Pull on, then, quickly,' cried Lawler, 'and let's warn them.'

'All right, sir; they ain't near 'em yet. And it's a rare good spot for perch, that is. You come along o' me some morning, sir, and I'll row you over here, and'—

'Pull, man, for Heaven's sake!' cried Lawler impatiently. 'Here, let me take one of the sculls.'

'Can't, sir; there's only one pair o' rowlocks. I'll be with 'em soon.'

They were now about a couple of hundred yards off; and, at Lawler's instigation, the keeper with him turned and shouted a warning: 'Mind them there posties, Jem!'

'Hey?' was shouted back.

'Mind them posties!'

'No posties here,' was the reply; and then, with the keeper pulling one oar, and Captain Barry the other, and a pretty good 'way' on, the broad flat-bottomed boat was seen suddenly to glide up on one side, as if it was being lifted, and overturn, while those who followed were still a hundred and fifty yards away.

'Row!' cried Lawler hoarsely, 'or we shall be too late;' and he quickly took his place in the fore-part of the boat. As the man tugged at the sculls, the little skiff flew through the water. As Lawler stood, divesting himself of coat, vest, and boots, he saw the capsized boat floating gently away, urged by the brisk breeze, Captain Lonsdale

clinging to the bottom, and shrieking for help; and Captain Barry and the keeper, Myers, swimming easily, and evidently in search of that for which his eyes were sweeping the water.

'Can't you see miss, sir?' said the keeper hoarsely, as he tugged at the oars, and sent the skiff nearer.

'No,' groaned Lawler. 'She went over with the boat, and it must have struck her; she hasn't risen since.'

As the words left his lips he was now so near that he left the boat with a spring, parted the water with joined hands, disappeared, and rose to the surface again, paddling and looking in all directions.

'Somewhere about there, Lawler,' shouted Captain Barry; and the young man gathered himself up, turned over, and dived.

'Here, help! Boat, boat!' roared Captain Lonsdale.

'Oh, you're all right, sir,' growled the keeper in the skiff, standing up and thrusting down a boat-hook, to see if he could catch the girl's dress.

'Try more to the right,' cried Captain Barry; and the man plunged the hook in again up to his shoulder, and again and again without success.

'Want help, mate?' said the keeper to Myers.

'No,' was panted out. 'I could swim for a week.'

'Like to get in, sir?' said the keeper, this time to Captain Barry.

'No, no, man; I'm all right. But for any sake, keep that boat-hook going!'

'Help, here! I can't hold on!' cried Captain Lonsdale.

'Then let go,' growled the keeper, plying hard with the boat-hook in every direction, while Lawler came up to the surface, and dived again and again, though his stay below was shorter each time.

The last time he came up, his face was blue, and there was a terrible look of despair upon it, as he placed one arm over the side of the skiff and hung there panting.

'You're good as done, Lawler,' said Captain Barry, swimming up to him. 'Get into the boat, man. — Pull him in, Smith.'

The man made as if to seize him, but Lawler warned him off.

'Haden't we best get the drags, sir?' said Myers, placing his arm over the gunwale.

'Here, help! Are you men?' shouted Captain Lonsdale. 'Bring the boat here; don't leave me to drown!'

As he had crawled on to the flat bottom of the capsized boat, and was only in danger of catching a very bad cold, no one stirred, but one blank face was directed at another, till, with a hoarse cry that was hardly human, Lawler suddenly thrust himself from the skiff, turned, and swam hard for the capsized boat.

'Where's he going?' cried Captain Barry. 'Good heavens! that I should have lived to see such a day!'

'To join the captain, sir,' said Myers. 'O sir, let's go and get the drags!'

'No, no; he means something,' cried Captain Barry excitedly. 'Yes, I see. Row after us;' and he loosened his hold, and swam after the other, just as, when near the boat, Lawler raised himself well in the water, turned over, dived, and

disappeared beneath the boat. A dozen seconds of agony followed, and as the skiff was rowed close up, and the captain rose, feeling that it was for his reception, the second keeper groaned, and said in a husky voice: 'The brave young chap's gone too.' But as the words left his lips, Lawler's head shot up on the other side, and with him rose the body of Tiny Murray.

'Quick!' shouted Lawler, beating the water; 'her dress is caught underneath.' In less than a minute, the skiff was round, and Tiny dragged in by the keeper; but he had to use his knife to cut her dress, which was hitched in some hook inside the boat. The act of dislodging this rocked the big boat so that Captain Lonsdale grew terribly alarmed for his own safety, and shouted twice in agony.

'Now, then!' cried Captain Barry to the second keeper, as he laid the inanimate body in the stern of the boat; 'row, man—back to the Hall, for your life—and hers.'

'What! and leave you gentlemen!' said the man.

'Yes, of course,' cried the sailor, passing an arm under Lawler, who was quite exhausted. 'Row for your life! Tell them hot bath—doctor!' he shouted; but the boat was already surging through the water, as the man bent to his task.

'Stop that boat!' shrieked Lonsdale. 'Are you going to leave me to drown?'

'No, sir,' growled Myers, crawling on to the bottom, and nearly dislodging the captain. 'We're a-going to drown all along with yer.—Here you are, sir,' he continued, stretching out his hand; and with his help, Lawler, blue and exhausted, was dragged on to the bottom of the boat, where Captain Barry soon joined them, with the result that the punt was sunk almost entirely out of sight, and its freight in momentary danger of being floated off.

'It's worse than murder,' groaned Captain Lonsdale, clutching convulsively at Myers.

'Ever so much, sir,' said the man dryly. 'Hudn't you better give me the tip as you meant, afore it's all over?'

Lonsdale glared at the keeper; but his aspect, with his wet hair and whiskers, was so far from impressive, that the man was not much moved. Until the skiff was out of sight, very little was said, and by that time, Lawler was somewhat recovered, but he lay on the boat without a word.

'I suppose the luke isn't very deep here, keeper, is it?' said Lonsdale, as they were drifting before the wind, and a hush nearly sent him off.

'Well, sir,' said Myers, 'I should say that just 'bout here's the deepest part of the whole mere; they do say as there's thirty foot o' water.'

The dragon's teeth chattered, and his eyes rolled despairingly about, but they met with nothing consolatory, for no one seemed to care for him, and again and again he wished mentally that he had learned to swim.

'We ought to touch that little island in a few minutes,' said Captain Barry, as they drifted on.

'And so we shall, sir,' said the keeper, 'or else get so near it we shall be able to swim ashore, and turn the boat.'

The news excited Lonsdale; and all turned out as the keeper had said. They drifted so near that he lowered himself into the water, felt for the painter-rope, and then swam with it ashore, dragging the boat up on the gravel. The men

then turned the punt over, baled it out, and were afloat in it once more and drifting before the wind, when the skiff appeared in sight with two men in it, bringing spirits, blankets, and wrappers. But the news of Tiny was far from encouraging. The doctor had been sent for, and the servants were doing everything they could, but the man was afraid that there was little hope.

CHAPTER IV.

It was, however, found on their return that there was hope, for the doctor had restored animation, but it was only for a severe feverish fit to supervene, and for many days there was a hard struggle with death.

The old admiral had insisted upon his guests staying, in spite of his trouble; and he appealed again and again to Lawler as to whether he was not the most ill-used man on the face of the earth. 'The gout's better, though,' he said; 'and gal, sir, I forgot all about it as soon as I saw them bringing my little darling up to the house. Lawler, my boy, if it had gone wrong with her, I believe it would have killed me.'

It was a fortnight before Tiny came down to the little drawing-room, looking very pale and weak; and no sooner was it announced, than Lonsdale rushed off to pay his homage. He was not gone long, however, before a message came into the study, where Lawler had shrunk upon seeing Lonsdale hurry off.

'She'll be better pleased to see *him*,' he muttered bitterly; and then he sat brooding, as he thought about the terrors of that day, of the agony he had endured, and the relief when he knew that she would live. 'Half selfishness; I thought more of self than of her, poor girl,' he said. 'Why should I grudge her the happiness she feels.'

'Where is he? In the study? Might have known'—

It was the old admiral's voice, as he came stamping across the hall, and the next moment he limped into the place. 'Here, I say, you, Harry Lawler, what the dickens are you doing burying yourself in books, and leaving me to drive myself mad hunting after you! This gout's coming back, like like—like a hurricane, sir. I shall be so bad to-morrow, that— O dear, O dear! But don't you know? Tiny's down-stairs again, and wondering why you don't go and see her.'

'Captain Lonsdale's with her,' said Lawler bitterly.

'No; Captain Lonsdale isn't with her either. Why, Lawler, you don't deserve to have the little lass, you don't; and for two pins, sir, I'd forbid it. Go and see her directly, you scoundrel, and, *egal*! if you say an unkind word to my darling, sir, I'll have you out and shoot you!'

Lawler stood hesitating, for he knew of old the leanings of his host; but this announcement that the captain had been up, and returned, and in so short a time—'Ah, poor girl!' he thought, 'she's too weak to have a long interview.' He felt a poke in the back from the admiral's stick as he crossed the hall, and the next minute the door had swung ~~so~~ behind him, and so great was his emotion, that the place looked blurred and dim before his eyes. He had made up his mind, though, to be very quiet, cold, and reserved. She would thank

him for saving her life, and he should say it was nothing, only that he was glad she was so much better, and that would be all.

And there she was, rising hastily from her seat, looking so pale and delicate, and yet eager, as she half ran to meet him, and he was so cold and reserved, that his heart gave a great throb, and before he knew it, he had caught her little hands in his, and was holding them to his breast.

'My poor little girl!' he exclaimed. 'You have been ill.'

'Yes,' she said softly; and—it must have been through weakness—she leant against him. 'I've been very ill, and I've thought a great deal while I was ill. They told me all about it.'

'About what?' he said huskily.

'About how brave and good you were, and how you saved my life.'

'Hush!' he said; and he laid a finger upon her lips, to have his hand taken in both hers, and feel it kissed again and again; and the next moment his arms were round her, and she was sobbing on his breast.

'And I've been half mad,' he said, 'and hopeless, and full of despair.'

'Why?' she said softly; and there was something of her old merry arch look in her eyes, as she met his fully.

'Because I believed you cared for some one else. But you did not love him!'

'No! never,' was the reply, frankly given. 'He flattered me, and was attentive; but my eyes were open before the day when that terrible accident occurred; and—and—you were so cold and cruel all the time.'

'And she don't care for you a bit, Harry Lawler, not a bit!' said a voice, which made them start, for the old gentleman had crept in quietly, to stand chuckling at the success of his scheme. 'Come here, puss. But there; you may kiss her once, sir, and then—— There, there; God bless you, my dear! you've made me very happy. Now, I can go and have my gout in peace!'

But somehow the gout did not come on, and the admiral was in high spirits the next day, even begging Captain Lonsdale to have another week with the pheasants.

But the captain was recalled suddenly to town, and the groom who drove him to the station said he was 'the stingiest gent as master ever had down.'

Mrs Rowbotham, however, thought differently, and she confided to Captain Barry her sentiments after tea.

'So thorough a gentleman, Captain Barry, suave, polished, possessed of the tone of good society, and of excellent birth. I think the admiral has made a great mistake—don't you?'

'No, ma'am,' said the sailor quietly; 'I don't.'

'You don't, Captain Barry?'

'No, ma'am; I think he would have spent the girl's money, and broken her heart.'

'Captain Barry!'

'Look there, ma'am—look there!'

He pointed with his eyeglasses to where Tiny sat, pale and thin, but with the light of love shining from her eyes, and Lawler reading to her from one of her favourite authors. They seemed to think they were unobserved, for Harry softly raised one little white hand to kiss.

Mrs Rowbotham gave her shoulders a little bit

of a shrug, and said nothing, for the admiral was coming up to where they sat.

'Mrs Rowbotham thinks we have done wrong, admiral, in apportioning our little pet. For me, I say we have done right.'

'Right! God bless them, yes.'

PRIMARY EDUCATION IN AMERICA.

IN the state cabin of the Cunard steamer *Scotia*, the following dialogue lately took place between the Hon. John B. Tomkins of Connecticut, and Mr William Roberts of London, who was on a voyage to the United States. We give it entire, as it throws some light on the methods of primary education in America.

Mr Tomkins. I suppose you are not coming across the Atlantic for the purpose of seeing the Exhibition alone? It is worth coming to America to have a look at her Free Schools, since you in England are now so much engrossed in educational subjects.

Mr Roberts. I should certainly much like to obtain some knowledge of your schools while in the States; and I confess I have not given more than a cursory attention to the subject. But perhaps you may be able to enlighten me.

Mr T. Any information I have is at your service. What is the first point you wish to ask me about?

Mr R. Well, I should like to know, whether the parents of your scholars pay for the education of their children, and also how your schools are supported?

Mr T. Our primary schools, I am proud to say, are now free. That desirable result has only been obtained within the last ten years; and so far as can be judged by statistics, this change has considerably increased the attendance at school. In my own state, the increase in two years has been more than eleven thousand; for if I remember rightly, the increase in the year after we passed our new law, that is, 1871, was more than five thousand. I attribute this increase almost entirely to the Free Schools, because in the year preceding the new law the increase had only been four hundred odd.

Mr R. Certainly this seems satisfactory. But will you mind explaining, if these schools are now free, how they are supported?

Mr T. Gladly. But of course I can merely give you the heads of the sources of the school income. The first source is the State School Funds. This, again, may be divided into two parts: that which comes from the income of capital produced by land given by Congress for the purposes of education, which used to be known as the Sixteenth Section Lands; and that which has been given out of the Surplus Revenue Fund.

Mr R. These moneys, I understand, may be said to be given by the central government then, and not by each state?

Mr T. Exactly. I am now coming to the moneys which come from the individual state. Presently I will tell you how little the actual government of the Union has to do with education. Well, the second head is, that of the State Taxes. These vary as regards the mode of levying them in different states. In Connecticut, for example, with which I am naturally most familiar, we pay one dollar and a half out of the state treasury for each child enumerated.

Mr R. Then in your state you don't even have a special tax, only a grant?

Mr T. Just so. That will shew you how widely the several states differ in the financial machinery. But really my third head, that of Local Taxes, is the most important, for by far the largest proportion of the required money is raised by these means. I won't go further into this part of the question; and I need only tell you that the fourth head consists of Donations in aid of education, such as those of the late Mr Peabody and others.

Mr R. Are large sums received from donors?

Mr T. Large when considered by themselves, but small compared to those obtained from taxation. In Connecticut, during the last ten years, we have received in gifts for various educational purposes something like three million dollars. In 1873 alone, the amount from local taxes in our state came to 1,105,601 dollars, or about £207,300 of your money; so you see the proportion.

Mr R. Now that we are on the financial part of the question, can you tell me anything about the expenditure—I mean the cost of your schools?

Mr T. The cost of our schools is the amount received from the various sources of income. I can tell you this much, however, for I have it in my pocket-book jotted down from the Reports for '73, that in Connecticut the expenditure per head on the population between six and sixteen years of age came to 12 dollars 89 cents. The expenditure in the other states was pretty near that figure: the highest was Massachusetts, with rather more than 21 dollars; and the lowest, Virginia, with rather more than two dollars.

Mr R. Who provide your schools, or rather see that they are provided—the separate state or the Union?

Mr T. That question brings us to the radical distinction which exists between the functions of the Union and the individual state. I will try to explain it to you. The Union has nothing to do with education. The only central body is the National Bureau of Education; but the duty of this body is only to obtain information for the use of those interested in education, not to manage the education of the people. Upon each state rests this latter responsibility; but here again the state only issues general directions, and leaves them to be carried out by the local authorities, according to the outlines enacted by each state. The township is usually the local unit which looks after education; in the states where the township is not employed, the local unit is a county or district.

Mr R. Do you have Boards?

Mr T. Yes. There are Boards called School Committees, School Directors, and so forth, who are elected, and who have to engage teachers, see that there are sufficient school-houses, and so forth. I should have told you, by the way, that in some states there is what is called a State Board, something like your Education Department, and in some states an intermediate officer—that of County Superintendent—who is a kind of inspector; quite a creation of the last few years.

Mr R. I should like to know what you do about religious teaching in your schools?

Mr T. That is not so easy to describe accurately, for you must remember again the number of states into which the Union is divided. I may, however, speaking broadly, say that no sectarian teaching is given; and that in most schools the Bible may

or may not be read, according to the view of the school directors or committee. Our schools are very little troubled, therefore, by any question about religious teaching.

Mr R. And about compulsion?

Mr T. A compulsory system has been introduced in many states, which have passed a law to this effect, and which, I think, will eventually become universal; but at present the flaw in our system of compulsion is that we have no officers whose duty it is to enforce the penalties, which must be done, generally speaking, by some tax-payer.

Mr R. And your system of teaching, or rather pure education?

Mr T. All our schools run, as it were, one into another. There are usually three schools or departments—'primary,' 'grammar,' and 'high.' Sometimes a 'secondary' is placed next to the 'grammar,' and makes a fourth. None of them, however, is like your grammar-schools, for, with the exception of the 'high,' they are in fact parts of the primary school. But in America all classes, high and low, rich and poor, attend the primary schools; which they don't, I believe, in England. The elementary course of instruction is thus carried on in the primary and grammar schools, the higher course in the 'high' schools. These primary and grammar schools, again, are subdivided into grades or classes; ten, eight, or seven, as the case may be. At Boston—to take an example which will fix the ages somewhat in your memory—they endeavour to pass all children into the grammar-school at the age of eight; that is, about half-way up the grades or classes.—Now I think you have a very sketchy outline of our elementary education; but you will perhaps, from this conversation, find it easier to go more fully into details when you have the various educational works at hand on your arrival in America.

THE PIGMY SHREW.

THIS is a curious little creature, frequently called the Lesser Shrew, the *Sorex pygmaeus* of naturalists. It is to the ordinary mouse what the wren is to the sparrow, and the snout and tail are of enormous length in proportion to its diminutive body. The stiff-looking bristles protruding from the droll little snout give one the notion of their having been borrowed or stolen from some neighbouring pig. The teeth are sharp and pointed, and differ considerably from the teeth of the common mouse; but it is quite a harmless creature, as its mouth is so small that a bite would inconvenience the giver rather more than the receiver. The great point in his favour is, that he is an insect-eating animal only, and persistently declines all temptation in the shape of grain, bread-crumbs, cheese, &c. When searching for a new hunting-ground, he moves slowly, keeping his snout in a state of perpetual activity, sometimes twisting it in the air in a most ludicrous fashion. My life as a girl in Ireland has been amused by watching the habits of shrew mice. They can climb, but not well or quickly. Our garden-wall was covered with a variety of flowering-shrubs, honeysuckle growing in a zig-zag fashion across the others. One shrew

used to toil slowly and carefully up the rough dashed wall in a direct line to the place where the honeysuckle was most heavily laden with blight, avoiding the cotoneaster and other shrubs, on which there was no probability of food. Its companions never seemed able to achieve this climbing feat, but always remained on the ground, shrieking with amazing power for such small throats. The shrew shrieks at everything; it is just as much its nature as the lark's to sing. It may quarrel now and then, but it is by no means the vicious being which its ugly name implies. Americans say the opossum has nineteen lives; now, I am of opinion eighteen out of the nineteen were stolen from the *Sorex* family by the cute 'possums. You may watch the operations of the shrew-mole as closely as you please; it will mine away most unconcernedly till there is nothing visible but the tip of its tail. But once lay hold of it, no matter how gently, and it immediately revenges the insult by dying in your hand. I can speak from experience, for I have tried the full-grown ones, and I have tried one no larger than a bean, with like result in all cases.

Notwithstanding the fact, that the peculiar odour of these little animals is their great preservative in most cases, it is no safeguard from the magpies. The magpies—their name was legion about our cottage in the west—used to sit up long after all other respectable birds had gone to rest, purely and solely for the purpose of committing wanton murder. Their only pleasure in killing frogs, shrew-moles, &c. appeared to be in the investigation of the dead body, which afterwards took place with all the clatter and argument of a Home Rule meeting. The Irish peasantry say the hedgehog (*granogue*) is 'the only animal that eats the snout-head or ant-eater;' but I must confess the only one which we captured on purpose to prove it, scuttled off with a grunt of indignation on being offered a dead shrew. To be sure, that old lady had five children, not gently reposing, but squeaking awfully like little pigs, in a neighbouring potato-furrow. Alarm at the danger of being separated from her noisy offspring may have destroyed her appetite for the time being; or she may have had scruples about eating dead-meat.

As to the shrew's nest, I have seen but one; and I am not ashamed to confess that I should never have found that one, but for the assistance of the ill-fated boy in the neighbourhood, who, I verily believe, was *en rapport* with all living creatures, whether bird, beast, or fish alike. Soft, marshy ground is their favourite building-place, and a bog is the most likely place of all.

One might tread on a dozen of these nests without being aware of it. There was nothing in the appearance of the wee bale of moss and dead-leaves, to lead me to suppose it was anything more than an accidental meeting of a bit of heather in some dry moss. It had no visible entrance whatever. If I hadn't seen the lady of

the house entering her mansion rather more than two feet off, and leaving it in quite another direction a short time afterwards, my doubts of its existence would have been considerable. The fact was, although the nest itself was built above ground, the tunnel which led to it was commenced a long way off, and about two inches under the surface of the moist clod. Being shaped like the letter V, there was always a spare road in case of accidents. Why she should leave her nest exposed, while taking so much trouble to tunnel the entrance, is inexplicable.

The Pigmy Shrew has but two young ones at a birth. Before the fur grows, they are not enticing-looking creatures. There is a dark hue round the snout and ears, or rather ear-marks; but the peculiar shape of the head is not very strongly developed. The odour from the nest is much stronger than from the full-grown animal, which is scarcely perceptible unless when terrified. Buffon speaks of the shrew as having eight or nine at a birth. I think that number must apply to the larger species. I never heard of a case in which the lesser shrew had more than two. Though one particularly damp border was honey-combed with tunnels, they were not sociable, like rabbits, but travelled either singly or in pairs. The latter was the most usual fashion.

The Irish peasantry consider it most unlucky to kill one of these snout-heads, as they believe them special messengers sent by Providence to destroy the insects which would otherwise injure the crops. It says much for Paddy's intelligence that he recognises the value of these useful creatures. According to Buffon, the labouring classes in England believed the shrew to be a most dangerous animal, which brought all manner of evils on the cattle and horses by merely running over them. The poison of a shrew-bite could only be cured by the following charm (we'll hope they're better educated by this time): 'Take the sap out of a piece of green ash, and plug up a living shrew in its place; then burn the whole to a powder; make into an ointment, and apply to the wounded part.' Another and surer charm was to cut a live shrew in half; apply while fresh, in the same way.

I should observe that the Rev. J. G. Wood considers the term shrew-mouse, which is used by Buffon, as inappropriate, as they evidently belong to the Mole tribe. He mentions a variety of shrews in the same family, particularly the water-shrew, which is the most beautiful of all, on account of the bubbles of air which adhere to its fur giving it a silvery appearance while swimming. He also notices the difference between the fur of the shrew-mole and the ordinary mouse or rat, when examined by the aid of the microscope.

But the Pigmy of the tribe is the only one with which we were on intimate terms, and great as our friendship was, he never condescended to visit us during the winter. To speak with caution, I opine that he does not hibernate, but feeds on grubs, wood-lice, &c., at a comfortable distance under ground. I am further strengthened in this opinion by his being so decidedly wide awake, when he is accidentally turned out by the spade.

And now, by way of conclusion, let me observe: there is one thing, reader, which neither you nor I know, and I hope it may be long ere the British pigmy shrew obtains an opportunity of informing

us—will this beautiful insectivorous little animal be of use in destroying the Colorado Beetle, should we ever have the misfortune to witness its arrival in this country?

THE MONTH:

SCIENCE AND ARTS.

IN ordinary writing, from thirty to thirty-five words a minute are written on the average. Many a letter-writer has often wished he could write quicker or more legibly, but has hitherto been hampered by pen and ink and the usual appliances. Something was wanted, and the something is now offered in the shape of the *Type-writer*, an instrument which prints in legible characters any letter or note, from two to three times as fast as it could be written. It would not be easy to convey an intelligible idea of this ingenious contrivance without lengthened details and diagrams; but the reader may imagine a small table, having in front a sloping key-board, and in the rear a frame-work which supports a roller, and incloses a concentric range of levers. The keys, resembling those of a telegraph instrument, are marked with the letters of the alphabet, and with the necessary stops and spaces. When required for use, a sheet of paper is placed under the roller; the keys are touched to spell out the words; each key impels a lever which bears on its end a corresponding letter; this letter strikes an inked ribbon placed below the roller, and prints itself on the sheet of paper. When the first line is ended, the roller and paper shift their position, and the second line is printed without loss of time, and so on until the letter is finished. In this way a sheet of notepaper or foolscap may be filled (after sufficient practice) with surprising speed. We have seen a nimble-fingered damsel touch off a despatch three times as fast as it could be written, and all in perfectly legible characters, which is by no means least among the advantages of this rapid instrument. The manufacturers are Remington & Co. of Queen Victoria Street, London.

Dr Thurstfield has invented a writing-frame by means of which people who are blind, or who see imperfectly, may write legibly and regularly; and people who can see may write in the dark. It comprises a small flat board on which the paper is held in place by springs. A wooden bar fixed to a movable stem crosses the paper. This bar guides the pencil and the fingers of the writer, who, as soon as he feels that he is come to the end of a line, shifts the bar down a notch, and so continues until the page is finished. The writing instrument is a style to be used with carbonised paper, or with paper specially prepared. Messrs Elliott Brothers of the Strand are the makers of this useful contrivance.

The Popoff air-bag, so named after the Russian admiral who invented it, for raising sunken vessels, has been tried at Portsmouth with promising result.

An old lighter, weight two hundred tons, was sunk to the bottom. The air-bag was fastened to it, and air was pumped in until the pressure indicated sixteen and a half pounds to the square inch. Then bag and lighter rose suddenly to the surface, and with such accelerated speed that the heavy vessel leaped, so to speak, four feet out of the water. The lifting power of the air-bag has thus been satisfactorily demonstrated. How many such bags would be required to raise the *Vanguard*?

The torpedo experiments which have been for some time carried on by orders of the Admiralty will shew surprising results in our next naval war—if we are ever to have another. A missile that swims with great velocity under water in any required direction, and blows up just when most mischief is to be done, is a formidable means of attack or defence. The shores generally and the entrances of ports may be so thoroughly protected by torpedoes that the approach of an enemy's ship would seem hardly possible. The forts at Spithead, in addition to their heavy guns, are to be used as torpedo stations, and we are told that in the Noman fort there will be 'a double series of electrical connections by means of five cables, with as many ground-mines. These mines will be surrounded by a number of hidden buoys, each connected with the trunk cables by subsidiary wires. Supposing, then, an enemy's ship should attempt to force her way into Portsmouth, every buoy she touched in her progress would instantly telegraph her approach and exact position to the engineers in the fort, and when it was found that she had got above a mine, or within the range of its offensive influence, a touch would complete the circuit, and an explosion would follow.' The effects of a series of such explosions may be imagined.

Experiments have been tried in some American steamships with a view to do the steering by means of compressed air. To steer by steam is not considered sufficiently trustworthy, as in time of war the steam-engine might be injured by the enemy's shot. When the screw is at work, it moves a pump which compresses air and forces it into a reservoir. When the vessel is under sail, the screw-blades only turn round as she moves through the water, and still furnish power enough to compress the air. The power thus stored is brought to bear on the rudder by mechanical appliances, which, under the influence of an elastic medium, work without shock.

A brick-making machine has been invented in America, which takes in raw clay, tempers it, rejects stones, and makes from fifty to eighty bricks a minute, or, on the average, about thirty-five thousand in a day of ten hours. This seems to be a snitable rate of production in a country where, for some years past, bricks have been baked by steam. The kiln is so constructed that the heat of the fires is made to superheat steam, and this steam is conducted to all parts of the interior, and through the

mass of bricks until they are thoroughly baked. Treated in this way, the bricks are of much better quality, and are less in price than those burnt by fire, for there is a saving of nearly two-thirds on the cost of burning.

It is known that hair, feathers, and such-like articles can be bleached by means of peroxide of hydrogen. A preparation of this substance is sold under the name of Auricome and Golden Hair Water. Dr Hoffmann, in writing on this subject, says: 'Peroxide of hydrogen is not the first body the industrial application of which commenced with trifles and gradually reached an unimagined extension. Nitrate of silver served first the vanity of the world as a hair-dye long before its applications in photography. A wish has been expressed that peroxide of hydrogen might be generally accessible at a moderate price, and that it were introduced into the pharmacopœia. For medicinal purposes it is preferable to oxygen, ozone, or ozone water. While ozone only bleaches ivory in the strongest sunshine of summer, there is no doubt but that peroxide of hydrogen would answer the same purpose even in the absence of light.'

The government of India are going to reorganise the system of meteorological observations which has been for some years carried on throughout that great country. Suggestion has been made that the opportunity would be a good one for the introduction of earthquake observations. India is subject to earthquake shocks, which appear to originate in the Himalaya; and if a continuous series of observations were made with seismometers and other instruments, some knowledge would be gathered on what is at present a difficult and obscure question.

Professor Loomis of Cambridge, New England, continues his 'Contributions to Meteorology,' in which he endeavours to shew what are the laws of the weather in different parts of the world. He traces the courses of storms, and finds that movement is checked by heavy rainfall. This is particularly the case in the neighbourhood of Nova Scotia and Newfoundland, where the warm water of the Gulf Stream produces such an accumulation of vapour that unusually heavy rains occur, and in these rains a storm is sometimes arrested for three or four days. Differences of temperature or of pressure have a remarkable effect and at long distances. In connection with this, Professor Loomis thinks he has discovered a 'law,' and that 'we must conclude that when the temperature of Iceland is much *above* the mean, the temperature of Central Europe is generally depressed *below* the mean, and this influence is most decided during the colder months of the year.' In corroboration of this we may cite an instance, of which an account was published by the Austrian Meteorological Society. On the 20th and 21st of May last, a belt of cold of unusually low temperature was observed in Russia and Austria. Mr Stelling, of the St Petersburg Observatory, in discussing the phenomenon, says that the cold is to be attributed to the continuous high range of the barometer, and prevalence of north-easterly winds in England, for some time before and after the two days of extreme cold.

Vice-admiral de Laugle has published an able paper 'On the Periodicity of Hurricanes,' in which he maintains that the sun and moon in their

changes of position with regard to the earth play an important part in those atmospheric outbreaks. Study of the records shews that hurricanes occur in certain years and seasons more than others. The season it is thought depends on the sun's place in the ecliptic, while the year corresponds generally with the lunar cycle of nineteen years; and Mr de Laugle finds on examining the particulars of one hundred and ninety-five hurricanes, that one hundred and nine took place within three days of the moon's apogee or perigee, and fifty-six at the time of eclipses of the sun or moon. An eclipse appears to intensify the aerial disturbance; but it is remarkable that the disturbances are the same in the two hemispheres. The years which shew most hurricanes among the islands of the West Indies also shew that hurricanes occurred in the east both on the north and south of the line. Twenty-five per cent. of the typhoons in the China seas fell on the same days of the month and in the same years as the hurricanes of the Antilles. This is clearly a subject which requires further investigation.

It is a sign of civilisation to build a lighthouse. Round the coasts of Japan and on the shores of the inland seas, there are now twelve lighthouses and two lightships. At all these, registers of the barometer, thermometer, and of the wind are kept; and out of the registers Commander Tizard, late of the *Challenger*, has compiled a *Contribution to the Meteorology of Japan*, which has been published by authority for the information of mariners, and all persons interested in the wind and weather of that far eastern group of islands.

At a recent meeting in Paris, Mr Leverrier stated that the coast of France is now well provided with meteorological stations whence warnings of storms are issued twenty-four hours in advance. Thus the example set by England is producing good results in other countries. For the inland districts a system of 'agricultural warnings' is to be carried out as soon as the details are settled, and these must necessarily vary with the physical character of the districts included in the scheme. For example, a warning to an agricultural district in Picardy could hardly be the same as a warning to a district in the Lower Pyrenees. At the same meeting it was mentioned that the leading features of the climate of Ajaccio (Corsica) are 'great atmospheric purity and uniformity, regularity in seasonal changes, slight barometric oscillation, mean annual temperature 63° 6', mean winter temperature 63° 2'.' These particulars may perhaps prove interesting to invalids.

During the rainy weather of last year, Professor Piazzi Smyth of Edinburgh, in making spectrum observations noticed a broad bend in the spectrum of daylight, whenever the atmosphere was charged with watery vapour of high temperature, or more particularly when rain was imminent from the south-east. It has been suggested in the Quarterly Journal of the Meteorological Society that as the south-east is a quarter from which the barometer is generally very little affected, the daily observation of, or looking out for, this peculiar rain-bend might prove useful as an addition to the ordinary means available when meteorologists attempt forecasts of the weather.

Among naturalists there are some who believe that an organic jelly-like substance which they call *Bathybius*, exists at the bottom of the sea, and

spreads a layer of rudimentary life beneath the deep waters. Mr Buchanan, who was chemist on board the *Challenger*, discusses this subject in a Report published in the *Proceedings* of the Royal Society. If, he remarks, this substance is really formed at the bottom of the sea, 'it could hardly fail to shew itself when the bottom water was evaporated to dryness and the residue heated. In the numerous samples of bottom water which I have examined, there never was sufficient organic matter to give more than a just perceptible grayish tinge to the residue. Meanwhile, my colleague, Mr Murray, had actually observed a substance like coagulated mucus, which answered in every particular, except the want of motion, to the description of the organism; and he found it in such quantity that, if it were really of the supposed organic nature, it must necessarily render the bottom water so rich in organic matter that its presence would be abundantly evident when the water was treated as above described.' The result of the treatment shewed that the supposed organic substance was in reality sulphate of lime, which when subjected to further experiment 'crystallised in the well-known form of gypsum, the crystals being all alike, with no amorphous matter among them.'

During the antarctic portion of the cruise, Mr Buchanan made analyses of sea-water ice—the ordinary pack-ice met with in those regions—and determined its constituents and the temperature at which it melts. From this he found that 'the salt is not contained in it in the form of mechanically inclosed brine only, but exists in the solid form, either as a single crystalline substance, or as a mixture of ice and salt crystals.' And he tells us that a very important practical consequence follows from his observations, 'namely, that pack-ice, though unfit to drink when a lump of it is melted as a whole, may serve as a source of fresh water if melted fractionally. As the melting-point of the salt ice is lower than that of pure ice, it melts first; and at the same time, by keeping down the temperature of the mass to its own melting-point, it prevents any of the fresh ice being wasted. When the salt ice has all been melted, the brine may be thrown away, and the remainder of the ice will supply fresh water. If a thermometer be kept in the ice during the process of melting, it will indicate by its reading when drinkable water is being formed.' These facts are worth making a note of by all who navigate the icy regions whether north or south.

A curious instance of animal transformation has been observed, which perhaps may prove interesting to unlearned readers as well as to naturalists. A small crustacean, one of the Entomostraca, is met with on the sea-shore in different parts of Europe. On the coast of Hampshire it is known as the brine-worm or Lynington shrimp; but its scientific name is *Artemia salina*. This creature inhabits the pools in the salt marshes near Odessa. Those pools, through the breaking of a dyke, had lost much of their original saltiness. The dyke was repaired, and the saltiness of the water went on increasing until it reached twenty-five degrees. Simultaneously with this increase a modification went on in the *Artemia*, until it was changed into a species known as *Artemia Mühlhauseni*. The transformation con-

sisted of a diminution of number in the lobes of the tail, and a general decrease of size. It took place among animals in a state of freedom, and was corroborated by experiment on similar animals in captivity, when precisely similar changes were observed. Moreover, the inverse experiment was tried: *Artemia Mühlhauseni* placed in water rendered less and less salt, gradually retrograded towards the form of *Artemia salina*. The importance of salt as a vital stimulus is, in this case, clearly demonstrated.

We are informed from India that there are large tracts in the Punjab where Dr Angus Smith's suggestions as regards cultivation of peat-bogs and formation of peat reservoirs could be applied with great advantage. Our brief notice of what the doctor has written on the subject appeared in April last.

A SOLDIER'S DEATH—1845.

THE foe had left the tented ground;
The fight was ours; the day was done;
When he fell, in a deadly swoon,
Above the heights of Sobraon.

Quick are his friends to bathe his brow,
To staunch the slowly trickling gore;
He sees them not, he hears not now,
Or whispered word, or cannon's roar.

But for a moment, as he waits
Till death shall close his glazing eyes,
His spirit, through the opening gates,
Sees a foretaste of Paradise.

His eye, poor wayworn traveller,
Rests once more on the heathery bryar,
The drooping birch, the stately fir,
That fringe the streams of Inveraye.

A little cot he sees once more,
White in the glare of the sunbeam,
An aged father at the door,
A bairnie paddling in the stream.

And from the schoolhouse, pouring out,
Beside the banks of silver Dee,
The lads and lassies call and shout,
And race and chase along the lea.

No more; but as the earthen coils,
Untying, loose his soul away,
His comrades catch the faltered words:
'The bonny birks of Inveraye.'

So let him rest: afar, alone,
Unseen of friends who held him dear;
His only word was: 'Duty done,'
He asked no pity, claimed no tear.

Yet not afar; yet not alone—
There is one sun, one sky, one day
Above the heights of Sobraon,
Above the birks of Inveraye.

TORTURATIONS.

TORTURING did not go out of use when it was relinquished in judicial practice. It remains a well-known element in our social system. It may be said to start up afresh with every new generation. Society, advanced as it is in many respects, inherently continues to be composed of Torturers and Tortured. We are not quite sure which is in the majority. Were we to accept the opinion of a venerable tradesman in Glasgow, who had much experience in worldly difficulties, we should say that torturers are much the more numerous. This sagacious individual, now at rest, used to allege that 'every well-doing man has about forty fules to look after;' from which shrewd remark we may assume that his troubles had been neither few nor light. There may have been exaggeration but also a grotesque truth in the observation. Every man who by dint of mother-wit and assiduity has worked his way on in the world, is almost certain to be embarrassed by a number of persons old and young, who, whether from mental incapacity, waywardness, or other causes, never cease begging or borrowing from him, or relying somehow on his good offices, and giving him an incalculable degree of trouble, which meets with no appearance of gratitude, and is all taken as a matter of course. In short, through the greater part of a long life he finds himself assailed by what we call Torturations of one sort or other. At fifty a number have probably dropped off, at sixty there are still fewer hanging on, and arriving at threescore and ten not more perhaps than one or two are left. It has been a dreary struggle. At seventy-six, when barely able to crawl about, the old man with a sigh of relief says to himself: 'At length, all my Torturations are gone. I can now close my earthly career in peace.'

It is a delicate subject to analyse. Torturations are of a very varied nature. In not a few cases they are more or less a man's own children. Sometimes, they consist of a flock of self-willed nieces. Sometimes, they are your own brothers and sisters. Still more melancholy the fact, wives

are occasionally the torture of husbands, and husbands of wives. Looking around scrutinisingly you feel that the whole social atmosphere is fluttering with 'Ne'erdo-weels,' who live but to give trouble. Who are those who give employment to police and criminal courts? Torturations. Who fill our prisons? Torturations. Who cause an enormous annual outlay, in rates and otherwise, to the soberly inclined part of the community? Torturations. In spite of everything that can be done, Torturations of different ages are the plague of the world. It has been so from the beginning, and we suppose will be so till the end of time.

One of the saddest kind of Torturations is that which is inflicted by a son on a father. On this score, what revelations could be disclosed of family misery! From the first the father has done all that man could do to provide his son with a suitable education, and to set before him a good example, with no end of the kindest precepts. All in vain. The lad is not devoid of excellent parts; he is rather clever than otherwise; but he has no solidity or foresight, is full of vague notions, and will settle to no regular business. He regards life as pretty much an amusement, and rejects the paternal counsels. Trusting to his father, he seems destitute of self-reliance. Encouraged possibly by frivolous companions, he is willing to drift on as a mere dependant; and the chances are that he drops into the hopeless condition of a 'Ne'erdo-weel.' The odd and incomprehensible thing is that while one son behaves in this eccentric fashion, another conducts himself as a rational being. Both have the same father and mother; both have been educated alike; and yet, for no intelligible reason, one is conformable to discipline and a comfort to his parents, while the other is a downright Torturation. Very hard this, very inexplicable!

Perhaps, if formally interrogated—put on his trial, so to speak—the young Torturation would have something plausible to say for himself. It would not surprise us to hear him indignantly discourse on being ill-used: 'I have, in fact, never been understood. Father would not allow

me to follow the bent of my inclinations. He destined me to go into his own commonplace profession, for which I have no turn, and heartily detest. Such being the case, I naturally lost heart, and went to the bad.' A clever line of defence. We are reminded of the lines of Pope—

A clerk, foredoomed his father's soul to cross,
Who pens a stanza when he should engross.

And so the scapegrace, who has never earned a shilling, rides off triumphantly on the score of outraged genius—his career in 'high art' had been cruelly checked. If let alone—only aided with a little money while trying his wings—he would have soared to be a poet like Keats or Byron, though unaware that he was devoid of the poet's inspiration. Or, if given fair play, he would by his talents have become a second Rembrandt or Michael Angelo, though, alas, destitute of the qualities that lead to eminence in painting. Worst of all, destitute of that acute intelligence and power of steady perseverance without which distinction in any line of industry is impossible. In melancholy cases of this nature, the best thing to do is to let young Hopeful have his way. He cannot be long in being awakened from his fantastic dreams. Failing to rise to eminence in his fanciedly sublime pursuit, there is fortunately still room in the world for him. As a last resource, he can emigrate to Australia, where, brought to his level, and without relations on whom he may sponge at pleasure, he will probably find an opening as the driver of a wagon, or in the honourable position of 'boots' at an hotel. The folks at Melbourne are not unacquainted with this class of imported Torturations. They can shew you M.A.s of Cambridge who once shone in the Ride at Hyde Park, and are now driving a bullock-wagon or blacking boots for a subsistence, or possibly herding sheep in the bush. It is a down-come to early prospects, and sorrowful for old friends to think of, but not absolutely to be lamented. Proverbially, 'a bird in the hand is worth two in the bush.' In a Torturation point of view, we should say that 'a relation in the bush is worth two in the hand.' Let the poor exile alone. Let him feel what he has brought himself to. It will do him good. He will become a wiser man. Nothing like the sharp tooth of experience for teaching the crazy order of Torturations. Herding swine brought the Prodigal Son to his senses.

We can picture something even more pitiable than a youthful Torturation. We could tell the story of a well-disposed son being brought to grief and poverty by a recklessly inconsiderate father. Not that the son was under any legal obligation to support his father's extravagances, or to pay his idiotically constituted debts, or to pamper his foolish tastes. But all that is of no consequence; the power of Torturation is not limited by statute. It takes a prodigious sweep over the affections. With the keen scent of a

vulture, it fastens on and remorselessly dominates the finest sensibilities of our nature. What son moving in good circumstances could endure the idea of his father going about as a beggar, or reported in the newspapers as being an incorrigible vagrant? Therein is demonstrated the father's *tour de force*. Working on the son's sensitiveness, he takes matters very complacently, depends on benefactions, and fixes himself down as a permanent Torturation. The son writhes under the burden, but for decency's sake he very likely says little about it. He possibly suffers in silence. The old fellow is less scrupulous. While daily pillaging his son by his exactions, he assumes the air of a distinguished martyr, along with the right of being impertinent to the son on whom he leans for support. Not improbably—we knew a case of the kind—the father lives as a Torturation till nearly a hundred years of age, all the time, while pensioned off under the obligation of not coming within twenty miles of the metropolis, amusing himself, as he considers to be his due, by playing cribbage at a guinea a game, to which diversion he was passionately attached; not apparently imagining he had any other duty in life. The interests of the well-doing son who has to come forward in relieving straits, when sheriff-officers are troublesome, are not for a moment thought of.

A wretched exhibition of human nature is this bit of daguerreotype, yet the old and heartless father habitually preying upon and distressing his son, scarcely composes so horrible a picture as that of a foolish mother, who for years and years cruelly preys upon and exacts the liberal support of a daughter, doomed to stand in the gap by the exigences of family misfortune, and to whom no immediate sympathy is extended. See the young woman, by birth and education a lady, and possessed of literary tastes, constrained to toil with the pen not alone for herself but her mother, whose whole consideration is centred in some selfish indulgences. No care given for the poor girl's long and exhausting labours. She is viewed as the drudge destined to support her weak-minded parent in every costly whim and fancy. She is to provide the finery of fashion, expensive articles for the table, the luxuries becoming for evening parties, the outdoor amusements from which there may be procured some *débat*. 'Mamma, I cannot afford it,' is perhaps murmuringly whispered. 'Nonsense; I cannot do without my comforts. It is all little enough you can do for me.' And so, to avoid a rupture, the wretched girl, lady-like and attenuated, toils sixteen hours a day. She has dreadful headaches, her eyesight is impaired, her life is little better than a slavery, until in the course of Providence that dreadful Torturation, her mother, is happily swept away from all earthly vanities. This is no imaginary sketch. It is the truth.

Not unfrequently, Torturations spring up unpleasantly in successive crops in a family over a

long course of time. To begin the dismal round : a youth, perhaps the youngest son of his parents, after being a plague for years, marries a woman as vain and intractable as himself. This union brings about a double Torturation. Then come the children of the frivolous pair, who have sense neither to guide themselves nor to be guided by others, and accordingly, in their wretched career, they form a triple, if not a quadruple Torturation. In the long round of infliction, uncles and aunts are worn out, cousins are worn out, friends and acquaintances of every degree are worn out. A complex and long-lived Torturation of this kind often continues in a flourishing and vigorous condition within a family circle for the greater part of a century.

Of course, it is easy to declaim on the folly of submitting to these Torturations. But in innumerable instances, not only a mistaken sense of duty, but a desire to avoid a public *fracas*—that odious fear of Mrs Grundy—is favourable to the domestic tyranny which we are speaking of. External decorum must be maintained. Professional character is thought to be at stake. Tear the veil from outer proprieties, and what suffering from secret Torturations comes to light. Take, for example, a much esteemed professional man, one who in his calling is considered to be at the top of the tree. What splendid success ! What a happy man he assuredly ought to be ! Yes, all is beautiful externally ; but look behind the scenes, and see what sufferings are endured from a Torturation. It is a case of a well and an ill doing brother. The successful man, assiduous and universally respected, is the prey of a wretch to whom, as a brother, he is constantly administering some species of relief, but on whom succour and advices are alike thrown away. The conduct of the Torturation goes beyond the demand for occasional doles. It becomes known that he is compromised in some transaction which will send him to prison, if not to penal servitude. Money is required to avert a prosecution. With indescribable agony a large sum is dispensed, and for a time there is a sensation of relief. But that time is brief. Fresh annoyances break out, as if they were to be endless. The sorely tried sufferer is in truth destined to sink under the affliction. An organic illness is aggravated by the scandalous behaviour of his heartless relative. He lies down and dies—of a broken heart—universally lamented. At the side of the open grave, looking bleakly down on the coffin of his victim, stands in mock-solemnity the hideous example of a fraternal Torturation !

In this little and too truthful sketch, as in previously mentioned cases, the error consisted in readily yielding to the impulses of a delicately sensitive nature. We are of opinion there would have been no loss of repute by allowing the prodigal to suffer for his misconduct. When Torturations are persistently deaf to admonition, and insist on ruining themselves, it is neither morally nor socially right to shelter them from the consequences. It is hard to offer this counsel. But surely no one out of mere sentiment is justified in submitting to years of discomfort, loss of health, it may be ruination, in the attempt to sustain the vagaries of incorrigible sons, brothers, or other relatives.

There was a time not long ago when young Torturations could have been got rid of by stuffing

them into situations in the Civil Service, or by buying commissions for them in the Army. These handy methods of providing for idly-disposed lads are now cruelly extinguished. Whether for civil or military appointments, youths of all sorts, aristocratic as well as plebeian, have to undergo a searching examination as distasteful and fatal to incompetent idlers as is the fume of brimstone to bees. A dreary outlook this for a certain order of Torturations and their relatives. As for those youths who think themselves too fine for ordinary business, we can see nothing for them but the elegant employment of bullock-driving or sheep-herding in Australia, such as has been faintly hinted at. No doubt, if money is at command, the fathers of Torturations may keep them nearer home, yet sufficiently distant not to be troublesome. We have specified the case of an aged Torturation being pensioned by his son on condition of never coming within twenty miles of the metropolis. As a middle course, the pensioning plan might, in a variety of cases, be tried with good effect. Perhaps it is not generally known, that Scotland has become a convenient place of exile for young Torturations from England—the Scotch by no means inviting the settlement among them of this class of strangers, but treating them courteously so long as they choose to be on their good behaviour. As far as we have ever heard, the plan works well, and is not very costly ; it is at least cheap in comparison to the pressure of incessant exactions and annoyances.

We may fancy a case in which one of these Torturations in Belgravia or Mayfair is addressed as follows by a long-tried and exasperated father : 'Now, John, I wish to speak to you seriously. You have worn us all out by your unsettled and most reprehensible conduct. The thing is intolerable. You have made your mother quite ill by that last terrible escapade, which brought you ignominiously under the notice of the police. Your sisters are ashamed of you and in a state of distraction. I tell you we are going to stand this no longer. Our mind is made up. You must go. Everything is arranged for your departure. Listen to what I have to say. We will not doom you to the wretchedness you deserve, but give you a chance of recovering your character. The plan we propose is very simple, and I trust it will be effective. You must quit London and all its associations and go to Scotland. It is a charming country Scotland—a fine bracing climate—the country, you know, of Walter Scott, the Lady of the Lake, and all that sort of thing—good society in Edinburgh and other towns—capital fishing in the numerous lakes and rivers—good shooting, and I am told, good golfing, but that I do not exactly understand. Anyhow, you will be furnished with reasonable means of support. Your pension is to be two hundred a year, payable quarterly by Messrs Sharplingly and Mucklewrath, a firm of respectable solicitors in Edinburgh, who will furnish all the local information you may require. Here is their card. You are to be allowed to live anywhere you like in Scotland, and do what you like. You may wear a kilt of any pattern if you like ; that does not concern us. Only just understand this : Your pension will be paid on the sole condition that you never cross the border into England. If you break bounds and come southwards, your

allowance will be stopped, and not another shilling shall you receive. So, there is the law laid down for you. Either go off instantly about your business, and never more darken my doors, or at once accept the arrangement I propose. You march on Thursday morning.'

This may be called coming to the point. John being firmly brought to bay, accepts the offered terms, for they are the only alternative of being turned out of doors. He accordingly packs up, and is seen off in the train northwards on the appointed morning. Leaving him to his shifts, we may generalise a little by saying we have chanced to see several of these dismissed exiles, and to do them justice, as far as we know, they fulfilled the contract by never breaking bounds. A kind of prisoners on parole, they did not cross the Tweed, and this is spoken of to their honour. Nor have we ever heard of any of them doing discredit to family dignity. A new home under stern obligations worked wonders. Though a little eccentric, as if with 'a bee in their bonnet,' they have usually been amusing fellows enough, taking hugely to golfing and angling, are particularly handy at picnics, and so on; but good for nothing in the way of serious business. Casting a retrospective glance over a gloomy phase of human weaknesses, one cannot but feel pleased that by the distant pensioning plan there is discovered, after all, not a bad niche in our social system for certain classes of TORTURATIONS!

W. C.

FALLEN FORTUNES.

CHAPTER XLIII.—HOW THE PREMIUM WAS PAID.

BROWN STREET is not lovely, but it is far from being so melancholy a place of residence as that wherein three-fourths of the population of London are doomed to pass their lives. There was light in it and air enough, at least for persons in good health; and at the end of it, where the builder's money had come to an end, and he went into the Bankruptcy Court, there was still a space unoccupied by brick and mortar, through which a glimpse of the country could be seen. This was not the valley of Sanbeck, but it was open ground, with a spectral tree or two, holding its ragged arms aloft, as though in deprecation of the advancing host of houses; and afar off was what looked like a village church—though it was, in fact, the tower of a Water-works Company. The dwellings in Brown Street were clean, at least externally—at Mrs Haywood's you could have 'eaten your dinner off the floor,' it was so spick and span—and they had not yet begun to 'peel,' to exhibit those cracks and flakes peculiar to stucco, which is analogous to some skin-diseases in the human frame. The street was situated between two magnets, or would-be magnets. There was an immense public-house at one end, which had not yet succeeded in withdrawing the custom of the humbler classes from the old pot-house in the neighbourhood, but was convenient for those who liked their beer on draught, and were not very particular as to what it was made of; and at the other end was an ecclesiastical edifice of iron, about which the pious part of the population had not quite made up their minds. Service was performed there every Sunday by a real clergyman;

but one likes one's church to look like a church, and it might not afford that security against fire—in the end—which its material suggested. From Brown Street ran off at right angles Little Brown Street, a spot devoted to the hatching of small shops of all descriptions; about half of which were added; or rather the thing that was brought forth—it was chiefly in the cheap newspaper and tobacco line, the toy line, or the cheap tailoring line (with a splendid picture of the Fashions in the window)—lived but a week or two; it sparkled, was exhausted, and went to the broker's. The omnibuses—one line of them, at all events—knew of the existence of Brown Street, because commercial gents of various kinds lodged there, and were 'taken up' every morning within a few hundred yards of it; but the cabs ignored it. 'Brown Street? Where was Brown Street? Might it be down away by the Duke of York's Head, ma'am?' A question no lady fare could answer. One may imagine, therefore, how entirely unknown it was to carriage-people. Yet on the very day after the arrival of the Dalton family, the equipage of no less a person than Lady Skipton did somehow contrive to find its way there. 'Never heard of such a place, my lady,' said the coachman to his mistress, when directed to drive thither. 'Never seed such a place,' was his remark, in confidence, to the footman, as the carriage bumped over the half-formed road, and over the broken bricks that plentifully strewn it; 'it's a cruelty to a carriage and 'osses.'

Jenny was not visible to her ladyship: after that episode of the lacework, she would not have seen her under any circumstances, but on this occasion she was really too ill to do so. The journey had utterly knocked her up. So Kitty received her alone. She was far from well herself, for she had had but little sleep; and she had been thinking all the morning what sort of reply she should write to Mr Holt's letter. But she felt that she was not in a position to refuse to see anybody who might be of service to them. It was a sickening thought that even her friendships as she had been accustomed to call them—must now be alloyed with views of self-interest. With Lady Skipton came her daughter Leonora—Lenny, as Kitty was wont to call her—who had attended classes with her in old days, and, next to Mary Campden, had been her greatest confidante. She was a pleasant little person, with a great deal of hair and a fairy figure. Everybody wondered how such an elephantine mamma her ladyship weighed about eighteen stone—could have produced such a gazelle. She was one of twins, her sister having died in infancy, or she would probably have been double the size. She had written poems: one, 'To my *Alter Ego* in Heaven,' was very much admired in her family circle. Kitty had always believed in her sensibility, and defended it against Jenny, who derided her ('She is too much "up," Kitty; like ginger-beer'); but somehow she now mistrusted Lenny's impassioned greeting.

'You got my letter, my darling, of course?' said this young lady.

She had written one to Sanbeck upon the death of Mrs Dalton, full of quotations from the poets, and which had jarred on Kitty's sorrow-laden ear. It had been a relief to her that Lenny had written 'Don't reply,' the one piece of true consideration in the letter.

'How terribly you must have suffered,' she went on. 'How pale you look, darling.'

'Black never becomes the complexion,' said Lady Skipton encouragingly. 'When she is in colours again, she will look more like herself. I am so sorry about dear Jenny; but doubtless the change of air will do her good. I am afraid she was annoyed with me about her lacework; she sent back the little present I inclosed to her.'

Then for the first time Kitty learnt the story of the unsold lace.

'She never mentioned the matter to me, Lady Skipton,' answered she, when it had been related to her.

'Come, then, let us hope she was not offended,' replied her ladyship cheerfully. 'I hope you will both come and dine with us, as soon as you get settled, my dear; of course it is a little *soon*,' said she, with a glance at Kitty's mourning garb, 'but then we are old friends.'

'I am afraid we shall not be great diners-out for the future,' said Kitty.

'Now don't you go and shut yourselves up, my dear,' replied her ladyship promptly. 'In your case particularly, it would be most injudicious. I won't promise to send the carriage, because Robert is so particular about his horses; he is in the worst of tempers at this moment, because there is a brick or two in the road: but when you come in a cab, mind, that is always *my* affair. I should never forgive myself if I caused you any expense, just now; though I have good reason to believe that the little inconvenience you may now be suffering from will soon be over.'

'I am glad to hear it,' said Kitty coldly, almost defiantly, 'though it is news to me.'

'Well, well, perhaps I am premature; I thought, from something that dropped from Mrs Campden — But no matter. I hope our horses—by-the-bye, they are old friends of yours, Kitty, for Sir William bought them of your papa—are not catching cold.—Lenny, just see where Robert has taken the carriage to?'

Lenny looked out of the window and reported progress in the direction of the public-house.

'I thought so,' said her ladyship with irritation. '—Well, my dear, you see we didn't lose a day in calling on you. By-the-bye, you have never shewn us that dear delightful baby. Is it like your poor mamma, or who?'

'The baby is asleep,' said Kitty.

'Bless it!' cried Lenny, clasping her little hands ecstatically. 'What is its pretty name?'

'John. He is called after dear papa.'

'Very right, very proper,' said Lady Skipton. 'If I had had a boy, I had made up my mind to call it after *his* papa: though, to be sure, when there is a title in a family, the thing becomes imperative. Little Tony, of course, is at school?'

'No; he is at home for the present.'

'Well, well; I daresay you are wise. So long as you can exercise authority over a boy, he is best among home influences.—Come, there is Robert at last; he is wiping his mouth with the back of his hand, so one knows what *he's* been after.—My dear girl, I do assure you it is not altogether a disadvantage to have to drop your carriage; that man's the plague of my life. God bless you!'

Kitty submitted to an impassioned caress from Lenny; and then, to her great relief, the visit was over. She felt a secret conviction that it was *pour*

prendre congé; and it proved correct. Lady Skipton's invitation to dinner was repeated, after a considerable interval; but she found it impossible—on account of Robert—to bring her carriage again to Brown Street. Her afternoon's adventure in the wilds of Islington gave her a subject for conversation for many a day, with opportunities for dwelling upon her favourite topic, the abominable behaviour of her coachman, and for delicately hinting at her own patronage of friends in reduced circumstances. 'I was not going to desert those dear girls because they happened to live in Islington; but what I went through to see them I shall not easily forget. The people stared at us as though we were a travelling circus; I don't think a carriage was ever seen in the neighbourhood before; and Robert was in the sulks for a month afterwards!' Sir William sent Kitty a brace of partridges and a hare from his country-seat. There would have been more, wrote his wife, but that the birds were so wild that year in Berkshire.

When Kitty went up-stairs, she found Jenny had not yet risen, although she had announced her intention of doing so.

'I felt a little giddy, Kitty, so I thought I'd be lazy. And I write in bed in pencil just as well.'

'Pray, don't think of writing, Jenny,' implored her sister. 'You are quite feverish, and your eyes are ever so much brighter than they ought to be.'

'That is because I am so anxious to hear about those dear Skiptons,' laughed Jenny. 'Was her ladyship affable, notwithstanding that we live in Brown Street? I am bound to say I didn't expect her to come and see us. Lenny, of course, was as gushing as ever. She will write a poem about us, called "Friends, though Fallen," or some such title: I can see her at it.'

'I daresay they meant well, Jenny; but I must confess that it was all rather unsatisfactory.'

'Then it must have been very bad indeed,' said Jenny.

'Well, they didn't even ask to see poor Tony, though they knew he was in the house, and you know Tony used to call Lenny "his wife," for years.'

'Ah, you see we can't be too particular—or too little particular—about young gentlemen who are not eligible. The simple fact is, my dear,' said Jenny, dropping her tone of raillery, 'the Skiptons are rubbish. Our position is that of a sieve, through which we find our sham friends are all dropping out. Nurse Haywood, Dr Curzon, and Jeff, remain to us; but the rest are all in the dust-heap. Let them lie there. I feel that we shall henceforward be independent of them. I am satisfied—weighing one thing with another, and not even taking into consideration the fact, that dear papa's society has been a sunshine among all these shady people, for which they will always owe him gratitude—that we are indebted to them for nothing. For the future, let us be careful to incur no obligations.'

Kitty's heart sank within her: she had Mr Holt's letter, with his receipt for the premium, at that very moment in her pocket; and Lady Skipton's hateful words—'Any little inconvenience you may now be suffering, I have good reason to believe, from something that dropped from Mrs Campden, will soon be over'—were still ringing in her ears.

'Above all things,' continued Jenny, 'I am thankful to think we have got rid of Mr Holt. To tell you the honest truth, I had really begun to think, dear Kitty, that from some mistaken notions of duty to your family, you might have been induced to listen to that man. Of course, you could never have liked him.—What? You don't say that?'

'Why should I say it, Jenny? He has certainly shewn himself well disposed towards us.'

'Yes; but for reasons of his own. Of course, he wishes to ingratiate himself with *you*. But do you suppose he has fallen in love with me, and Tony, and the baby also? I saw through that man—I flatter myself—from the first; and I see him—in my mind's eye, Horatio—to the end. Shall I tell you what I see?'

'No, Jenny. I don't wish to hear it. Besides, you are exciting yourself; and I am quite sure that quiet is what you want. Pray, do not try to write to-day.' She took the pencil and paper from Jenny's hand, who gave them up without resistance.

'Perhaps you are right, darling: I will let my brains lie fallow for a day or two; they seem all in a muddle somehow.'

Kitty had never seen her sister looking so ill since they had left Riverside. The excitement she had lately gone through, combined with the fatigue of travel, had evidently much affected her. Instead of being the prop and stay she fondly hoped to be, it was more probable she was about to be seriously ill. Dr Curzon had always said: 'Jenny is progressing, and that is well, for standing still in her case is impossible; there must be improvement, or else retrogression, which would be dangerous. Her constitution is deficient in rallying power.' The plain English of that professional expression was only too clear to Kitty.

Here, then, was another and urgent reason why she should make up her mind to accept Mr Holt's assistance; yet, in doing so, she felt that she would be accepting so much more, that it gave her pause. Jeff was sure to call that evening on his way home from office, for he lodged close by; and she resolved—not to consult him; no, him least of all men; but to ask him one question before answering Mr Holt's letter. After that she would take her own way in the matter, without seeking advice from any one.

As she was taking her frugal supper with Tony—for the housekeeping was now in her own hands—Jeff arrived. She felt a disinclination to be alone with him, born of her mistrust in her own fortitude; her heart was wax towards him, and melted at his presence, though she was so resolved he should not mould it.

'Jeff,' whispered she, while Tony was engaged with a new book his friend had bought him, 'tell me the truth about dear papa. Is there any hope of his coming back to us?'

'There is always hope, Kitty,' replied he gravely. 'Where there is life,' she answered. 'But is there life? Is there any chance of his being alive?'

Jeff did not answer, only beat softly with his fingers on the table, and looked most miserable.

'You are loath to give me pain,' she said. 'I would not put you to pain unless there was a necessity for it. Dear papa has insured his life for our sakes. Is it worth while to pay the premium which has become due?'

'O yes,' returned the young fellow eagerly. 'You can pay it under protest; that is, supposing that the policy should have fallen due already; in which case you will get the money back again. And then, you will make all sure. It is clearly the right thing to do, if—if—it can be done.'

'It can be done,' returned Kitty gravely. No more was said upon the subject. When Jeff was gone, and all the inmates of this little house, save herself, were fallen asleep, and freed from earthly cares, Kitty sat down and wrote her answer to Richard Holt. In her own name, and for herself, she thanked him for the payment of the premium. She spoke of it as a loan, of course, but expressed her sense of his generosity as well as of his forethought. She would not pretend that there was, as he suggested, no obligation; she would not affect to understand that his kindness had not herself for its object. She would never encourage him; nay, she would temporise and procrastinate as much as she could; but her weapons—weak though she felt herself to be—should be at least fair weapons, and therefore hypocrisy could not make one of them. Many women will deceive and cajole even those they love; but this one was truthful to the man who, in her secret heart, was hateful to her.

CURIOSITIES OF THE WIRE.

TELEGRAPHY affords ample room for the occurrence of curious and remarkable incidents, and these, it may be explained, arise generally from a variety of causes. In its early infancy the telegraph, as can well be imagined, was like the railways at first, a source of much wonder to many who came under its influence; and even at the present day there exists a great deal of imperfect knowledge and misconception concerning it. I remember a lady-friend apologising not long ago for faults, &c. in a telegram she had sent me, offering the excuse that it was the first she had ever sent. I assured her there was no occasion to apologise, since the original document did not, of course, come into my hands. The following, kindly supplied to me by a telegraphist in the London Central Station, to whom it really occurred, is also a case of patent misconception as to the powers of telegraphic communication. An old lady presented a telegram at the counter duly addressed. Telegrams being not unfrequently sent to the counter-clerk in that manner, my informant began to open it. 'What are you about?' exclaimed the lady in surprise. He, of course, explained that it was impossible to send a message *without first seeing it*. 'Then,' replied the female, in evident ire, 'do you suppose I'm going to let all you fellows read my private affairs? I won't send it at all; and therewith she bounced out of the office in high dudgeon.

One of the chief eccentricities of the telegraphic wire is frequently to refuse to do its duty altogether, and pile on the battery-power as you may, probably not a vestige of current reaches the distant end. Before the transfer of the 'telegraphs' to government, it was no uncommon thing for the companies occupying the roads and canals to have half-a-dozen 'repeaters'

or 'automatic clerks' between London and the North, in order to get their traffic through. Practically, in fair weather there is no limit to the distance the current will travel; but in bad fogs and wintry weather, the loss of current at the supporting poles is so considerable that the greatest difficulty is sometimes experienced in keeping up the communication with distant centres. Spiders are the bane of the telegraph; they choke up the cups of the insulators with their webs and nests, and in foggy weather render them conductors rather than insulators.

The tendency of the action of atmospheric electricity during thunder-storms, on the telegraph, is generally to demagnetise the instruments, thereby causing the needles to move in a contrary direction; or in the case of a Morse instrument, to cause the paper-slip to record dots *only*, instead of the proper code of dots and dashes. It also sometimes causes the total or partial destruction of the apparatus, and as a consequence scares the employes present. Lightning, in its eagerness to get to earth has been known to blow the telegraph apparatus to pieces, fusing the wires that form the electro-magnets and charring the wood-work. Where the earth connection of the wire has been made to a metal gas-pipe, an occurrence of this description has been found to melt the pipe and fire the gas; while on more than one such occasion the flame of the gas has in its turn melted a contiguous water-pipe, and thus saved the building from very serious damage, if not from total destruction. It may be added that those earth connections which are attached to water and gas mains are considered the most reliable.

Blunders occasionally take place from the imperfect writing of the receiving clerks. We have had telegrams delivered to us utterly unintelligible. A celebrated doctor was once sent on a fruitless journey by receiving a telegram worded—'Don't come too late.' As originally handed in to the telegraph office, the message ran: 'Don't come, too late; but in the transmission, the signal denoting the comma was omitted; and hence the considerable inconvenience to which the recipient was put. This instance shews, however, what care telegram-senders should exercise to avoid the least ambiguity, since the mere reversing of the phrases thus: 'Too late, don't come,' would in the case in point have dispelled all doubt as to the meaning which was to be conveyed. At the same time, of course, it also shews that the telegraphist in receiving and transmitting telegrams cannot give too much attention to apparently the most trivial matters.

Another instance is taken from Mr Scudamore's lengthy Report of 1871 on the 'Telegraphs.' A London firm telegraphed to a country agent: 'Send rails ten foot lengths.' The letters 't' and 'e' are in the Morse code represented by a dash — and a dot respectively; but in transmitting this message, the instrument in recording the word 'ten' signalled two dots instead of the dash and dot, and the word was thereby converted into 'in,' the message reading: 'Send rails in foot lengths.' Mr Scudamore adds, however, that 'if the senders had been less chary of their words, and had written: "Send rails in ten foot lengths," which would have cost no more, the blunder would never have occurred.' In somewhat the same manner, in a message where the sender asked for a 'hack'

to be waiting him at the station, the letter 'h,' which is signalled on the Morse instrument by four dots, was converted into 's,' the signal for 's' being three dots; the wayward instrument having failed in one dot, the consequence was that the traveller found a 'sack' awaiting his arrival.

We can imagine the astonishment of a butler who received a telegram from his master—a certain nobleman—asking him to send at once 'ten bob,' as he was 'greatly in need of it.' Of course the message had been wrongly transmitted, 'ten bob' having originally been 'tin box.' This story, which happened not many years ago, was told me by a gentleman who was in the telegraph service at that time, and had to deal with the complaint which was made about the matter. The following also comes from the same source. At one of the gatherings held periodically at Braemar, some years ago, a certain earl telegraphed to Edinburgh for a 'cocked-hat' to be sent to him at once. In transmitting the message, the article mentioned as wanted was converted into 'cooked ham,' which was actually forwarded forthwith, greatly to the surprise and indignation of the nobleman.

A telegram was once received as follows: 'Please send your pig to meet me at the station.' Of course it should have been 'pig,' the instrument having made what, in telegraphic phraseology, is called a false dot, by recording . — . . . (1') instead of — . — . (G). In fact, it is almost necessary to state, for the credit of the telegraph, that the treachery complained of is, after all, not intentional, but arises mainly from a difficulty which it appears to have in distinguishing the difference between certain letters. This is plainly so in the letters 'y' and 'x,' which the electric wire is constantly confounding one with the other. Over and over again jaded railway officials have been caused fruitless searches after a missing 'black boy' through this want of power, on the part of the telegraph, to discriminate between 'y' and 'x.' The stories current on this point are numerous, but the best I have yet heard is the following: Some time ago, a station-master received a telegram from a lady, stating that she had left at his station 'two black boys' in the waiting-room, she believed, and tied together with red tape; would he please forward them at once. The astonished official caused search to be made; but instead of 'boys' he found two 'boxes' in the waiting-room, as described, which were duly forwarded. From a similar cause on the part of the electric fluid, a lady received from her son-in-law a telegram which astonished her not a little. It stated that his wife had presented him with a 'fine box.'

Sometimes, however, the telegraph takes it into its head (metaphorically) to substitute in messages passing along the wires, words altogether different from the original; more by way of a joke, let us conjecture, than anything else. But in some cases the joke fails to be appreciated by the victim. For instance, a gentleman who recently telegraphed for some ice was more wroth than amused by the playfulness of the instrument, which converted 'ice' into 'ten,' and thereby caused a box of the same to be sent at once.

In the same manner, the sense of a message sent over the wire by a gentleman who had left his wig in the train, and desired it searched

for, was unmercifully altered, the word *wig* having become *wife* when the telegram was received at its destination. Diligent inquiry and search was of course made for the missing lady, but without avail. The mistake was, however, ultimately discovered, and the lost article recovered. Another story tells of exactly the reverse, where a gentleman, being detained out on business, telegraphed for his wife, but was strangely surprised to receive by the next train a *wig* instead. Let us hope that when he returned home his explanation of the trick the telegraph had played him was accepted by his wife as sufficient excuse for his 'absence without leave,' and saved him from a wiggling.

During the lectures by the Anti-Papist Murphy at Bury, Lancashire, he was severely hauled by a mob, and according to a telegram, 'seven of the men charged with an assault on Mr Murphy were *boiled*' (bailed).

Here is a curious mutilation of a telegraph message hardly to be accounted for. Not long ago the clerk of a small telegraph station near Burton-on-Trent was surprised to take from his instrument a telegram addressed to the '*Master of Miseries*.' He was naturally puzzled how to effect its delivery, and only succeeded by receiving from his head office the information that the message was really intended for the 'Master or Mistress' of a school (not a Dotheboys) in the vicinity. Let us add that it was only in the short distance between Burton-on-Trent and the telegraph station referred to, that the message became so equivocally altered!

A large number of the erroneous messages which pass over the telegraph arise through some fault of the senders themselves. The most common fault of senders at present is that of making their telegrams too short, for which there is really no need, when a uniform rate of so liberal a character has now been conceded to the public by the government. Another too frequent fault upon the part of the sender is bad penmanship. If the caligraphy is nearly illegible, mistakes must continue to exist. The person who telegraphed to a broker with reference to certain stock which he desired to have transferred, was alone responsible for the mutilation which occurred to his message, in which, with graphic brevity, he described the transferee as of 'Largo, Fife, widow.' The broker received it as 'large fine widow.' Again, the curt instructions, 'Sell three orles five' contained in a telegram proved disastrous to the sender, for it was transmitted to the addressee: 'Sell three *or* else five.' If the sender had availed himself of the sixteen words which were still at his disposal in this case, the mistake had surely never taken place. A firm of brewers at Burton-on-Trent recently received an order by telegraph to send '6 casks of butter;' but inquiry elicited the discovery that bitter ale was meant. Again, less brevity would undoubtedly have prevented this error.

The following extract from the telegraph-book preserved at the Paddington station appeared some years ago in the *Quarterly Review*. It is illustrative of the great use of the telegraph in criminal matters, and is so interesting as to merit record here. '*Paddington*, 10.20 A.M.—Mail-train just started. It contains three thieves named Sparrow, Burrell, and Spurgeon, in the first compartment of the fourth first-class carriage.'—'*Slough*, 10.48 A.M.—Mail-train arrived. The officers have cautioned

the three thieves.'—'*Paddington*, 10.50 A.M.—Special train just left. It contained two thieves, one named Oliver Martin, who is dressed in black, *crape on his hat*; the other named Fiddler Dick, in black trousers and light blouse. Both in the third compartment of the first second-class carriage.'—'*Slough*, 11.16 A.M.—Special train arrived. Officers have taken the two thieves into custody, a lady having lost her bag containing a purse with two sovereigns and some silver in it; one of the sovereigns was sworn to by the lady as having been her property. It was found in Fiddler Dick's watch-fob.'

'It appears,' continues the writer, 'that on the arrival of the train, a policeman opened the door of the "third compartment of the first second-class carriage," and asked the passengers if they had missed anything. A search in pockets and bags accordingly ensued, until one lady called out that her purse was gone. "Fiddler Dick, you are wanted," was the immediate demand of the police-officer, beckoning to the culprit, who came out of the carriage thunderstruck at the discovery, and gave himself up, together with his booty, with the air of a completely beaten man.' The effect of the capture so cleverly brought about is thus spoken of in the telegraph-book: '*Slough*, 11.51 A.M.—Several of the suspected persons who came by the various down-trains are lurking about Slough, uttering bitter invectives against the telegraph. Not one of those cautioned has ventured to proceed to the Montem.'

No wonder that, as the *Quarterly* writer adds, 'ever after this the light-fingered gentry avoided the railway and the too intelligent companion that ran beside it, and betook themselves to the road; a retrograde step to which on all great public occasions they continue to adhere.'

The last curiosity of the wire which I have now to touch on is of a sentimental character. 'Can the telegraph make love?' has been asked of me. Yes! most emphatically, as could well be attested by many a telegraph operator. There are many stories current as to marriages that have taken place between telegraphists, the courtship having been carried on through the medium of the wire, although the parties concerned were miles apart. The best story I can remember at the present time in reference to this matter is told by Mr Scudamore. Berlin and London are directly connected by wire. At one time a male operator occupied the seat at our end of the wire, and a female at the other. As time went on, those two began to know something of each other through daily telegraphic intercourse; and naturally enough, for while conversing with each other per wire, during spare moments, they came to possess a mutual knowledge of each other's habits and character. Cartes-de-visite followed. Later on, to use the language of love, hearts were exchanged, electricity was made the slave of love, and finally the happy pair were made partners for life at the hymeneal altar! By the telegraphist, distance is laughed at, for he or she can talk to the operator at the other end of the wire, no matter what number of miles away, as easily as to his or her next neighbour; while experts are said to be able to tell the handwriting of those with whom they have been in the habit of wiring.

The story I have given is not the only one on record; many are known to have taken place, and

there is no doubt that still more have also occurred through this agency that are not known. Nor need we wonder that Hymen sometimes plays a part, when I inform my readers that certain love-code signals exist, known only to the parties most interested; and that it is perfectly possible for a sentimental telegraph clerk at A to transmit a kiss instantaneously to the lady who has charge at B, or—*vice versâ*. I have seen it done!

FOLLOWING UP THE TRACK.

CHAPTER I.

It was the year 1807, and in two of the southern counties of Ireland—namely, Tipperary and Waterford—the approach towards winter was marked by many acts of violence and outrage. There then existed no organised constabulary force to track out offenders with the zeal and energy the sportsman displays in the pursuit of his more innocent quarry; and when the intelligence arrived of any tale of horror, it was generally so magnified in the course of its transition, that to hear at the breakfast-table of only one murder having been committed, produced a positive feeling of relief, as the head of the family kissed his wife and little ones when leaving home for a day or two in the way of his business. The guardians of the peace consisted principally of pensioners from the army, past their labour; the idle sons of the tenants of magistrates who stood well with the authorities at Dublin Castle; or the relatives of bailiffs connected with the large estates of absentee proprietors; and it was only when desperate riots at fairs or elections took place, that the military were called out, to shoot down a few people by way of example, but generally making victims of those merely attracted to the scene of action through curiosity; and thereby intensifying the hostility which was entertained against all connected with the observance and administration of the law. What a contrast to the present, when we find an intelligent, educated, and trained quasi-army of twelve thousand men occupying the country, and stationed in almost every village, taking note and heed of every stranger passing their barracks, and, under the stimulus of the hope of promotion or reward, following the cunning doublings and twistings of the habitual criminal, be he the cruel assassin or the mere petty pilferer of the hen-roost or the potato-pit near the road-side!

The ordinance of the curfew bell of the Norman Conqueror William was a precedent followed when affairs assumed a very serious aspect, and nine o'clock at night was the usual limit permissible to loiterers; but so many pretexts were afforded for assembling at distant markets, wakes, and other social gatherings, that if it happened to some vigilant magistrate to come upon a body of men at a forbidden hour, there was the ready answer for his 'honour,' that 'sure they had been in the town selling slips of pigs, or a cow, to make up the rent to pay the agent; or they were at the berrin of Phil Ryan's decent gossoon, or the wedding of Darby Guinane's daughter; and sure the way was so lonely, honest people had to wait for each other.' And for such and the like pleas, there would occasionally be some semblance of truth, because it is marvellous indeed the love of a humble Irish peasant or agriculturist for

the wasting his time at any rustic reunion or gathering, whether purporting to be held for business or merely diversion. Many a shilling Pat spends in order to economise a prospective penny; and a journey is made of eight or ten miles to buy a pair of brogues or 'pumps,' because they are to be had for a trifle less than in the shop in the village almost in view of the door of his cabin, although by this process he, if a labourer, loses his day's hire; and should he happen to be that travesty upon the science of agriculture 'a small farmer,' his horse is taken from the plough for the expedition, and at the most critical period of the year no sound of labour is heard lending its glad music to the deserted fields. And how readily are the virtues of the dead made a pretext for the idleness and improvidence of the living. When a neighbour has breathed his or her last—and the word 'neighbour' is applied in its Scriptural generality—all within the two or three adjoining parishes at least, including the halt and the blind, are sure to flock to the 'wake;' and the prospect of a glass or two of whisky and a heavy 'shock' of the pipe contributes to the estimation in which the memory of the deceased is regarded. We are bound too to confess that stimulated by the genial drink, accidents occasionally happen on the way to the grave-yard; and an unlucky shout or wheel of defiance in the Homeric spirit, from a Dwyer against a Hayes, a Shanavest against a Caravat, or some other equally senseless cry, surges up into a fierce faction-fight. The coffin is suddenly dropped upon the road, and the congenial waves of conflict sound the requiem of the departed one. In Corsica, the widow hangs up in the hall of her dwelling-place the clothes in which her husband was slain, in order that her children may daily observe the rent made by the cruel knife, or the perforation of the ball in the homespun brown cloth; or she sews a strip of the stained linen into the garments of her son, as a memorial of his duty to the deceased. But Pat does not require such a spur to bring up all the ancestral wrongs inflicted by the members of any faction with which he is at variance.

At the period we are writing of, Maurice Power rented a small farm about eight miles distant from the assize town of Clonmel, and situated in one of those picturesque districts, the attraction of which consists rather in the boldness and abruptness of its contrasting scenery, than in the beauty of any one isolated portion of the landscape. The suburbs of the town left behind, and the bridge over the river Suir crossed, the traveller finds the road to the 'Glen Farm' winding along the edge of a mountain of fern-crested verdure, and insinuating itself with tortuous dexterity past every obstacle and opposing projection; at one time seeming as if it must come to an untimely termination, and at another lengthening out until obscured by the shadows cast by some more than usually lofty peak; and a glance back would reveal in the valley in the distance the faint outlines of the church, the jail, the hospital, and the barracks, those ordinary institutions of civilisation—one class to instruct and heal, the other to repress and punish; and presenting in social antagonism the several types of good and evil. At a part of the road where it suddenly at the right inclined

under the mountain, before it bridged over a small tributary stream, there was a recess, rendered densely gloomy by a belt of overshadowing pine-trees; and through them a bridle-way led up a ravine. The sun never glanced down on those pines. This was attributable to the configuration of the height in immediate proximity; and superstition had its dreadful tale, and a heap of ruins was pointed out which was once said to have constituted the home of a happy household, all the members of which were immolated, because the father had become a witness against men who had robbed him. A lonely 'boreen' or lane was the approach to the lonely cottage of Maurice Power; but the cleared cultivated space around evidenced the industry and the energy of the owner; and the smoke of the turf-fire curled over the domestic roof in fantastic wreaths, as if reluctant to leave its genial protection.

CHAPTER II.

It was an evening late in October—the period of the year when, like unto the decline of life, the bright recollections of the summer sunshine are mingled with the anticipations of more gloomy days—that at the door of the farmer's dwelling stood a fair girl just passing into womanhood; her deep-blue earnest eyes directed to the boreen, while a miniature counterfeit of herself, held in her loving arms, was pulling down over the anxious face of the young mother a luxuriant mass of golden hair. Mysteriously sacred is the tie that links together a mother and her child—the fragment of her own being never alienated from her, however estranged in the opinion of the world, by guilt or infamy! At any other time, the slightest touch of these tiny fingers would have sent the blood rushing through Ellen Power's frame, but her features were now averted from her first-born, and one person only was in her thoughts. She paused to listen. A step was heard in the lane; nearer and nearer it came, and in a minute more the wife and child were within manly and encircling arms.

'Maurice, dear,' said his wife, after the first greeting was over, and she had proceeded to get ready their supper, bringing forth from the cupboard in the corner the freshly made roll of butter, the gathered cream, the eggs just laid, sufficient to induce an appetite in the most fastidious Lucullus of Piccadilly or Sybarite of Belgravia—'when I heard the trees moaning down in the glen to-day I almost fancied, such was the dread got over me, that it was likely the "banshee" would be coming here to-night; but then I took courage, when I remembered that the spirit only waits on the "quality" when death is nigh at hand. And after all, sure God is very good to the likes of us not to let us be frightened before our time is come.'

Maurice Power, like many of his countrymen, was an aristocrat in feeling, and proud of the tradition that those whose name he bore, and from whom he was descended, once held the countless acres which repeated confiscations had transferred to the stranger and the absentee; indeed, he had truer claims to an ancient lineage than might be set forth in the vamped-up pedigrees enrolled in certain colleges of arms, pedigrees which but too often possess neither the reality of history nor the interest of fiction. He was learned enough to know to what sept

he belonged. His ancestors were not so favoured as the O'Neills of Ulster, the O'Connors of Connaught, the O'Briens of Thomond, the O'Lachlans of Meath, and the MacMurrongs or Kavanaghs of Leinster, who were alone received within the pale of the English law down to the reign of Elizabeth, and admitted to the right to sue and be sued; but Maurice had been told, that in the possession of the elder branch of the family whose name he bore, there was a veritable map tracing out the broad lands which they were to get back again when the Cromwellian and the stranger should be expelled. And after all, there is surely something worthy in the respect which is entertained for ancestry, when the claimant is an honest and an earnest man, who, instead of clothing himself in the decayed garments of the dead, puts on his own home-spun workman's attire, but is equally anxious as they were when living, that no stain shall appear upon them, no blot mar the family escutcheon.

'Don't talk the like of that,' said the husband; 'for my heart is never so light for work, and the plough never seems to pass along so easily at the head-land, as when I think of getting back a few of the acres those once had who have gone before me, depending upon no dirty scrap of writing or the good-will of an agent, and with no fear at any hour of being turned adrift upon the waves of the world. If we have a "mane" opinion of ourselves, why should not others have the same? Recollect what Father Mulcahy said in his sermon last Sunday in the chapel, when the agent was telling all the tenants that if they would not vote as he ordered them, they would have to quit the place for ever. "He wants your souls as well as the rent; but grand as he thinks himself up there in the great house, six feet of the ground he took from the Widow Murphy and her little orphans will lie heavy on him when he comes to die. He was a *shoneen* when the fathers of those he afterwards turned out were walking about in grandeur." But,' continued Maurice, 'when the pride was coming into myself at the thought of being after all much better than Mr Driver, his Reverence quashed all but good thoughts when he ended by reminding us that the blessed Lord died for all of us, gentle and simple—for the poorest beggar that walked the road, as for the finest estated gentleman in the whole county, and that the one was as precious in his sight as the other.'

'True for you,' was the response of the wife; 'and sometimes, but it is not often, when I am about to ask what the rich were made for, and why the likes of you have to work from mornin' to night, the sunshine breaks through the shadow, and then I begin to pity, rather than grudge them all they possess; for surely they must find it harder to get to heaven, and be longer on the way, with the weight of what idle people must always have to carry with them. They have a tedious journey to make, and begin it with too many things which they don't wish to part with, or throw away.'

'After all,' remarked the husband, 'though my mind goes with you, my heart does not, for I should be proud to have the banshee come to our window when any of our people were going to depart, for it only weeps and cries for the old stock, and shuns a new-comer.'

As this equivocal source of consolation found expression, Ellen Power turned pale; and the wind, which had been playing among the fallen leaves outside, causing them to dance in fantastic eddies, commenced that peculiar wailing moan which it requires no vivid fancy to picture is the lament for the dying and the dead. Possibly the sound in this instance was the first burst of grief indulged in by nature herself—a monody over the waning glories, the gladness, the sunshine of the departing autumn—over the long days, with their flowers and their fruits, their hum of insects and song of birds—over the long days to be so soon shrouded in early night.

‘Don’t leave me for a long time again, Maurice, for I feel something strange coming over me these last few days, and more-betoken there is bad news about the “boys,” for the “army” and the tithe-proctors are hunting them out in every place.’

‘You mustn’t give heed to such notions, my darling, for I can’t help going to Clonmel to-morrow; and if I don’t raise fifty pounds more to make up the two hundred I went security for your cousin Delany, the sheriff and his men will be here next week; and this house will no longer be ours; and yonder mountains look upon us no more.’

A track of pain made its furrow across the usually placid face of the young wife; but she made an earnest effort to appear calm, for she recollected what a wild and graceless fellow her kinsman Delany was; and her own good sense had originally caused her to hesitate to ask her husband to lend his name to the raising of the money in the bank; but then she recalled to mind the fact that her cousin had loved her passionately; and in the impulsive promptings of her heart to remedy in some measure a wrong she had inflicted, the suggestions of calculating prudence were forgotten.

To be enabled to say ‘No’ is a cardinal virtue, requiring, however, much present self-denial, and which, if more practised, would have blotted out from the pages of History many of its direst tragedies, and from the annals of Commerce many a ruin-spreading disaster. ‘No,’ would have enabled the mother of Cain to remain a dweller in Paradise, and thousands of her descendants to live in happy homes, instead of being wanderers and outcasts on the face of the earth. But then the word ‘Yes,’ although with only one letter more, has so much of facility in its utterance, such a graceful yielding to the exigencies of the passing hour, that all sense of future responsibility is forgotten; and whether it be to give the order for a massacre like that of St Bartholomew, the sacrifice of a Socrates, the burning of a Latimer, or the execution of a Sir Thomas More, or the agreeing to accept a bill for the accommodation of a friend, there is a terrible significance in the little word of three letters. And in the case of Maurice Power, the ‘bit of writin’ in the bank had become a serious affair; and Ellen, who felt that the subject was one too painful to dwell upon, went about the discharge of her household duties with great assiduity, as if occupation would bring relief to her mind; but such muttered observations to herself as ‘There’s something quare hanging over me this blessed night,’ expressed in prosaic language the impressive thought conveyed in the more euphonious utterance of the poet.

Coming events cast their shadows before.

CHAPTER III.

Next morning the homely breakfast was over, and Maurice rose to depart. He had bidden his wife good-bye over and over again, and left the little room, but returned once more under some idle pretence, too obvious to deceive and yet plausible enough to be sanctioned by affection; but at last motioning her back into the cottage, he passed down the breen leading on to the high-road, not venturing to turn his head, even when the sound of the raising of the latch caused the blood to rush rapidly to his heart, and his imagination pictured Ellen standing at the threshold, her tears falling fast over the child now folded in her arms. And it might be asked, where was the young farmer going? From what friend was he about to obtain the money which was to be the ‘open sesame’ of the fairy tale, and to retain for him the untold treasures of home? It is more blessed to give than to receive, is the language of Heaven. It is better to oppress and grind down to the earth, is too often the doctrine of the world; and even when a less harsh creed is professed, how often is an otherwise good deed spoiled by the manner of the doing. Debt is bad enough as an ordinary evil; but when an usurer holds the bond, pitiful indeed is the case of the victim!

Maurice Power had lived long enough to know that he could call upon few friends when his object was to borrow money, and therefore he resolved to wait upon Stephen Meagher the usurer, one of that class whose profession is to trade upon the miseries of mankind; wretches by whom good harvests, considerate landlords, and the Samaritans of society, are regarded as afflicting visitations of Providence; while a famine year or a potato-blight are blessings that swell out the rate of interest and add another figure to the multiplication table.

A quick walk of two hours, and the farmer reached Clonmel; and after passing through some of the principal streets, turned down a lane, in the leading dwelling of which the well-known urban discounter carried on the double occupation of money-lender and publican; a lane, most of the structures in which shewed all the dilapidations of age without any of its decencies. Tottering nests of timber, crested with roofs which had upon them patches of sickly grass; attic windows, in which were stuffed broken bottles, tiles, and tattered rags; doorposts bending towards each other in perilous familiarity; one or two rooms more ambitious than the rest, meant for lodgers likely to contribute to the payment of the rent; and partly lighted by a few panes of glass of a deep-green colour, the bull’s-eyes in the centre of which glared ominously upon the humble pallets in the corner, and upon dislocated chairs and stools, often converted into weapons of offence, or defence. Boils of mortar and blains of dirt of Egyptian malignity marked in every direction the spread of a social plague; and even the fervent imagination of a future Ruskin could not have discovered any redeeming feature in this chaos of confusion and disheartening penury.* The street channels and narrow passages swarmed with children, who seem, by some unaccountable

* The present condition of Clonmel is in marked contrast to the scene described.

ordinance of nature, to increase in an inverse ratio to the ability to maintain them; and their wondrous ruddy faces, so far as they were visible through their masks of smut and grime, and their bright eyes, shone with premature intelligence.

As he passed by these hovels Maurice shuddered, for he thought of his own loved mountain home, and of what might become of his wife and child should he fail to obtain the advance he required, and be turned out of his farm; and his hand trembled as he touched the half-closed door of the public-house, a building which stood a little recessed from its neighbours, with an obvious assumption of superiority. A bow-window at one side of the entrance was decorated with glasses, and pipes crossed upon them; and three or four dingy decanters stood filled with coloured fluids of very questionable reputation and purity. The building itself presented the remains of past respectability, but there was manifested the downward career of what had once been well-conducted brick and mortar. The signboard of the *Traveller's Home* announced the fact that good entertainment could be had within for man and beast; but the natural question suggested itself, where were the responsible guests to come from and remain in such an establishment—who could indulge in the luxury of having an animal worth the price of a feed of oats? The private parlour to the left of the hall presented a dreary aspect, with faded green curtains to the windows, excluding light and air, and strongly guarded by iron bars.

When the anxious intending borrower walked into what appeared the dingy den beyond the bar, and sat down, he found himself alone; and the thought arose, and not a very reassuring one, that it was to the owner of this hard-featured abode he must apply for the obtaining of the aid which was to extricate him from his present difficulty. There are those who assert that bright or dark impressions are created irrespective of locality; but let the wearied worker in the slums and alleys of a town catch the fresh breath of the country, and even on his apathetic feelings, a revelation of better things to come is made known. The cynic may characterise the country as only a 'heathy grave'; but the peasant who, when he opens his cabin door in the morning, looks out upon the wide pastures and hears the lowing of the kine, and becomes associated with the kindred humanities by which he is on every side surrounded, may bless the Providence that saved him from going out to his day's labour from the crowded town garret with its pestilential accompaniments. Maurice Power waited in the room into which he had been ushered, a considerable time, or possibly it may have been only the state of his feelings that led to this impression, and paced up and down the broken earthen floor, till his suspense was at length brought to an end. He was startled by the abrupt opening of a door he had not noticed in the corner of the passage leading from the bar, and a man stepped forward with the interrogation: 'What may your business be here?'

'I want to see Mr Meagher, and to him only can I tell what it is that brings me to this town.'

'Then out at once with whatever you have to say, for I am the man you are speaking of, unless, indeed, I was changed at nurse.'

Maurice looked with a perplexed air at the individual who thus addressed him, for he had formed

in his own mind the traditional conception of a usurer—namely, that he must be an elderly and physically feeble man, insinuating in address and voice, and with cunning and craft in every wrinkle in his parchment face; while on the contrary, the person in question was scarcely forty years of age, of gigantic stature, and rude and rough in manner. A closer examination, however, would have disclosed lines insinuating themselves towards the angle of the mouth, imparting to that impressive feature a harshness almost intensifying into cruelty; while the light-blue eyes, contrasting strangely in colour with luxuriant masses of dark hair, were restless and quick, but averted the moment attention had been directed to them.

'If you are the gentleman I want'—and the epithet 'gentleman' was emphasised—'you may easily guess what call I have here. I must have money without counting many hours, to meet the sheriff; and I am ready to pay what you may charge for the loan of it, and to pledge the word of an honest man that you shall be paid back in a little time.'

'Pledge your word!' observed Meagher with a sneer, dwelling with emphasis on the last word. 'I could not pin a duplicate on any such security; and those who come to me on the like business as yours may be honest, but they are unfortunate; and honesty and misfortune are bad neighbours, and generally part company for peace-sake. To be poor is not a crime, but there are those who think it worse. And now, may I ask who you are?'

'I am Maurice Power, and tenant of the Glen Farm.'

'I think I have heard your name well spoken of before. Who is your landlord?'

'One who, if he was at home, would not let any of my name carry with him a heavy heart, or a light purse, or be beholden to a stranger for what he could give himself; but he is far beyond the seas, and not even the cry of the widow or the orphan could travel across the big waves.'

'But if he is so generous and kind, a letter would in the end be sure to find him.'

'Doing that would be sure to vex the agent, for he would always like to be thought the master himself; and besides that, the hand which can turn the plough so well at a contrary head-land, can't manage the pen so easily; and then again, I would not strive to make a poor mouth, when I have enough to shew that my credit ought to be good.'

There is, or used to be, a prevailing poetical superstition that even for the doomed souls in the world of suffering where Satan reigns, there is one day in the year in which they are permitted to revisit the earth, and to be conscious of a sympathy with those whom they have known in their happy period of existence, even though the subsequent reaction after such a brief interval must prove a purgatory in itself; and somewhat in analogy to this belief, the miser on this one occasion seemed to be liberated from the thralldom and the curse of avarice, and to be actuated by a sense of pity.

'How much do you want?'

'Fifty golden guineas—no less and no more.'

'I knew, when I was a boy, the farm which you now hold,' observed Meagher; 'at least I think I do so; and as I consider from your looks that you

are an honest fellow, at least so far as honesty can keep company with poverty, if you sign a note for the money, and also leave me your lease as a security, I will try and raise what you want, for I have not the whole of it in the house, and must borrow a part of it.'

It was the old story over again—the conventional language of usury—the shibboleth of the exchange and the mart. The money was to come through a delta of divided tributary streams, and before it reached the main channel was to be reduced by absorption no less than forty per cent.

'For Heaven's sake, save me; for the sake of my wife and our poor child; but I cannot give you the lease, for I left it with the agent, who has promised to get me a new one for a longer time; and he won't be home from the north, they tell me, for the next month; but I will put my name to any bit of writing you ask; and if not at Christmas, you shall surely have the loan back at Shroffside.'

Meagher smiled bitterly; and perhaps he was judging rather too favourably of himself when he replied: 'Why, I might be in heaven before that time.'

'I hope not,' was the response of Maurice; and he then proceeded to falter out some unmeaning withdrawal of the expression, as he was conscious that the hope intimated might admit of anything but a favourable interpretation.

'You might before the time you have fixed upon be a homeless beggar, my friend. I wish you a good morning, and friends that would be disposed to do more good than I can, who am a black stranger to you.'

'For the sake of the mother who bore you; for the souls of your people who have gone before you; for all the blessed thoughts that came across you when you were a child; and more than all, for the blood poured out for me as well as you when we had nothing to offer for it but our sins, give me your help in this day of my want and sorrow; and may the angels make your bed when the light grows dark in your eyes, and you cannot even hold in your hands the money which, if spread out before, would have done you good, and brought out the prayers of the poor! I am honest; indeed I am;' and as the troubled man held with a tenacious grasp the coat of him he addressed, it needed no attesting witness to prove the verity of his plea, for nature's own seal had made its impress upon it.

'Honesty is, I am quite sure, a very good thing in itself, and also helps to keep people out of jails and troubles,' remarked Meagher; 'but it does not pay the rent. It won't put clothes on the back, or money into the pocket; besides'—and here the speaker's voice assumed a tone of mingled incredulity and insult—'how am I to know that you have a penny to meet your rent, even if you were to get from me the fifty guineas?'

The honest farmer trembled with suppressed passion. His truth had never been questioned before at fair or at market, even when subjected to that most trying test to all veracity, the selling of a horse, in which process all social and moral considerations seem to be so frequently ignored. But too deep a stake was at issue in this juncture to permit him to speak out his mind, and after a pause, he replied: 'Your dealings with those who are in trouble may have made you suspicious, and

perhaps after all you may be in the right; but come with me to the Glen if you think me a liar, and I can count up for you the guineas I toiled to put up before my marriage, and there is not one of them, if it could speak, but would tell how often I shunned the public-house, and the dance, and the wake, and the hurling; and worked after the night was far gone towards morning, my only music the voice of the good spirit whispering into my ear, and the hope lifting up my wearied eyelids, that one day I might be able to ask *her* to be my wife. Often and often have I looked at the money, until I began to get afraid I might think of loving it as well as my darling Ellen.'

'Excuse me,' observed Meagher, 'if I appeared to doubt you; but I have often very queer people to deal with, and who, when they are in trouble and distress, are not very particular as to what they do with the goods of those who have something to lose. But aren't you a foolish fellow (I mean no offence) to keep any decent sum of gold at home, when the "boys" are out so much of late, and you living in such a lonesome place?'

'I often thought that myself; but since a bank broke, my wife began to think there would be no safety at all in any strange people, and she got me to draw out all my little store of money; and until the landlord comes home from foreign parts, and tells me what to do with it, she keeps it by day in a hole in the thatch, and at night in the foot of a stocking, the string round which never leaves her neck; and sure the neighbours think it must be the blessed rosary she has near her bosom.'

The usurer, to whom any device was a source of pleasure, smiled significantly, and said, after a pause: 'Your words have made a change in me, and I will go out of my way to serve you, even if I find no good return for it. This is Tuesday; meet me here on Friday night.'

'Friday night!' echoed the farmer, with a marked manifestation of surprise. 'Why not in the daytime?'

'Because, as I told you already, I must myself borrow part of the money from a friend who lives a good start away from this, and he told me only yesterday, that he would be selling stock at Kethard on Friday, and could not be home from the fair before dark. And as I must be at heavy costs about your business, you must sign this,' pulling out, as he spoke, from a drawer a sheet of paper, and proceeding to make out some apparently elaborate calculations with the aid of a well-thumbed arithmetic book, the manual of his devotions at the altar of extortion.

What borrower in his hour of emergency has time or calmness to think of the future? With one foot on the rock near the iron-bound coast—the baffled waves clamouring around, and casting the spray from their lips upon him—the drowning man will grasp at the sea-weed although it may give way to his touch; and if bleeding and bruised he can reach a spot of safety, what matters to him then that he may be a beggar for the next morsel of food? He has escaped from the imminent peril; that is enough. And thus likewise, when in the mid-ocean, the burning ship and its blistering timbers leave no resting-place for the seaman, he will fling himself into the expanse of waters, to win but a minute's immunity from death.

No doubt Maurice Power felt a momentary pang when affixing his name to the I O U, drawn

out in due legal form, purporting to constitute him a debtor to Mr Stephen Mengher, inn-keeper and money agent, after the lapse of half a year, in the sum of £89, 18s. 9½d. Now, your usurious lender delights to deal not only in generalities, but also in minute details when a purpose of apparent accuracy is to be attained; and an odd halfpenny is almost of itself sufficient to disarm all inquiry. How can the debtor ask by what process, in the course of six months, is the increment to be so great in favour of the capitalist? No doubt all is right. In the present transaction, and after the document was signed in due form, in a spasm of generosity the ninepence-halfpenny was struck out of the account; and when the host and the guest finally parted, the latter felt an ease of heart he had not enjoyed for many a long day.

GARDEN PARTIES.

Of late years the fashion for this pleasant means of passing a summer afternoon has become deservedly popular, and all classes of the community, from royalty itself down to the vast middle class, have participated in its pleasures. In the garden parties of all but the very highest class, there is usually a total absence of formality, and as a consequence there is much more sociability—a faculty in the nature of us Englishmen which is capable of much improvement. We will not discuss the merits of those gatherings of the 'upper ten' where a regimental band is engaged to discourse a selection of music, and where everything is carried out in a strictly polite and coldly correct manner; but we will endeavour to give some idea of what is done at the residences of the middle classes, and suggest means for the greater enjoyment of these social gatherings.

Garden parties are most natural and therefore most enjoyable in the country; but in many of the suburbs, where the gardens are so situated that they cannot be overlooked by the neighbours, the party is perhaps quite as pleasant, although it be necessarily a little more formal in its relations. Than garden parties there is no better way of bringing together one's friends and acquaintances; and as the entertainment is comparatively inexpensive, and does not entail much trouble, it is possible for the host to assemble a large party several times during the summer without intrenching too much upon his income. What, then, are the requisites of a successful garden party? A good hostess is indispensable. If her efforts be seconded by the aid of a husband who does not decidedly object to parties of all kinds, and by that of a few olive-branches who have arrived at the age of discretion, so much the better. In addition, the following must be considered as more or less necessary: a fine day, not too hot; a good large garden, with one or more lawns; some games for the amusement of the guests; plenty of attendants; and, last though not least, a goodly number of visitors with a fair proportion of men. Children are perhaps in the way at a garden party of adults; they cannot enjoy themselves as they like, and therefore ought to be provided with little garden parties of their own. In anticipation of the guests the lawns are closely shaved and neatly trimmed, the garden-paths weeded and swept, and the flower-beds put in order. Croquet hoops are adjusted with a carefulness worthy of a better cause

in one part of the lawn, while other games are arranged in suitable localities. There is a set of lawn-bowls: there the paraphernalia of lawn-tennis are to be seen; while in remote corners, 'Aunt Sally,' 'Jack's Alive,' or other adaptations of old-fashioned games, are provided for. A tent is erected if necessary, and all the available chairs, sofas, settees, &c. are conveyed into the garden and placed in shady spots; for many ladies whose girlish days are past, prefer to take a passive rather than an active part in the entertainment, and seem to delight in sitting quietly chatting with their friends, admiring or criticising the doings of the younger people, and talking over the news of the neighbourhood. This naturally suggests the idea of tea; and it will be found that a plentiful supply of tea and coffee, expeditiously served by ready waiting-maids, will tend to add immensely to the success of the afternoon. A light refreshment is found to be an agreeable item in the afternoon's enjoyment, and should be handed round soon after the visitors arrive; it usually consists of iced claret, hock, or champagne cup, or other varieties of cooling cups and dainty drinks. A word or two about the games provided. Croquet, which has held supreme sway for many years, appears to be gradually dying out, but there are still a few ardent enthusiasts who take great pleasure in a well-contested game, and play constantly on their own lawns; but we think that at these social gatherings it is hardly admissible now-a-days. Who that can play with any degree of skill cares to engage in a game with negligent players, who have to be reminded each time it is their turn to play; and then perhaps do not know what hoop they want, or have forgotten the distinctive character of their own ball! At all events, from whatever cause, croquet is seldom indulged in at garden parties, and if provided, is but poorly patronised. It has, in fact, become too scientific a game for the generality of people, and so has lost its original prestige.

In some parts of the country the game of lawn-bowls is very popular, and deservedly so, for it is a most interesting game, and capable of being played thoroughly well by ladies. For this game a well-kept and tolerably level lawn is necessary. Badminton has enjoyed a transient existence, but has been for the most part eclipsed by the more fashionable game of lawn-tennis. This latter is very enjoyable for gentlemen, exacting, perhaps, a little too much exertion from them in hot weather; but it is rather too energetic a game for any but exceptionally active young ladies. Occasionally, however, it is played remarkably well by some of the fair sex, who have practised it assiduously on their own lawns; and we are glad to see that the number of lady players has increased—a healthy sign of the growing popularity of the game. To procure a good set of apparatus for the game is, unfortunately, rather an expensive matter; but with a little ingenuity and the aid of the village carpenter, it is quite possible to make up a set at a very trifling cost. Instead of the expensive rackets, plain deal ones of a similar shape perforated with small holes, to diminish the resistance to the air, are found to answer admirably, and they cost only about a shilling each. It is easy to find two posts to support the netting, which can be improvised from the ordinary garden netting; and thus, after procuring some balls, we

can play lawn-tennis to our hearts' content for a mere nothing. 'Aunt Sally' is sometimes patronised, but it is not usually a very attractive game. We have seen a most amusing game at 'Jack's Alive' played with great enthusiasm by four or five country parsons, all beyond the middle age. Their evolutions, although perhaps not quite in keeping with the gravity supposed to be proper to clerical gentlemen, were, however, much appreciated by their fellow-visitors. This pastime is a modification of the old-fashioned school-boy game of 'duck-stone,' and is played in a similar manner. It is, however, somewhat out of place at a garden party, being too boisterous a game for ladies to engage in, and therefore not admissible. From our experience of other games it is evident that however popular a game may be, we cannot go on playing it for ever, and so, like croquet, lawn-tennis will most probably lose its attractions after a few seasons, and we shall yearn for something else which possesses the charm of novelty. The 'short holes' at golf afford attractions of the most inviting kind for ladies; and wherever the ground presents the requisite inequalities, the game ought to be introduced and encouraged, more especially as our *répertoire* of suitable outdoor games and amusements is at present extremely limited. Indeed there is plenty of scope for the invention and adoption of new games and pastimes. Meanwhile we will suggest a few ways in which we may perpetuate the interest in our garden parties. In the early summer we may, during the hay-making season, prudently invite our friends to a hay party, where those who like can amuse themselves by tossing the hay about, while others can lounge on the sweet-smelling hay and sip their tea in any position they like; or we may combine a garden and hay party, so as to suit all tastes. As to pastimes, we think the simple game of 'catch-ball' would find many supporters and create lots of fun; while 'trap-ball' and 'battledore and shuttlecock' might be tried with advantage. Lawn-quoits, too, might become a very interesting game if the quoits were made of india-rubber or some light material, so as not to injure the grass. Archery, again, might be indulged in at garden parties, and would, in our opinion, form a great attraction to the members of both sexes—a desideratum of the highest importance. Doubtless skating rinks might and will be formed in private gardens by those who can afford the luxury, and may at some future day be one of the attractions of a garden party. As additional means of amusement we would suggest the performance in the open air of chorades, short pieces from suitable plays, as selections from Milton's *Comus*, &c., with occasional *al fresco* concerts. Hand-bell ringing, too, might with advantage be practised by a few friends, and employed as a means of entertainment at garden parties, for it is well known that the bells never sound so sweetly as they do when rung in the open air. These and like additions would add greatly to the success of these social gatherings, and enhance the enjoyment of the guests. The pastimes, however, although a necessary, are not the most important, part of the afternoon's business; they are but a means to an end. They serve as vehicles to friendly and social intercourse, and if they succeed in that they attain their end. At a typical garden party each visitor does exactly what he pleases; there is no constraint

of any kind, and no one is expected to join in this or that game unless he feel inclined to take part in it. Thus every one gratifies his own particular taste, and, as a natural consequence, every one is pleased.

EEL-FARE.

In Scotland very few people can be found who will venture to partake of eels. Whether this prejudice against this kind of food is founded on the resemblance which the eel bears to the serpent, or is a remnant of the ancient Jewish prohibition of its use as an article of diet, we will not venture to say. Probably the form of the fish is the principal obstacle to its general acceptance at the table; but it is a curious fact that the antipathy which is felt towards the eel is localised in different parts of the country, or confined to special districts or races. Thus, while Scotland as a whole repudiates the fish, there are parts of England in which this fare is held in the highest estimation; while as a class, perhaps omnibus drivers—to judge by the avidity with which they devour their pen'orth at the little stalls in the street corners of the large towns—are most partial to this dish.

Those who have a taste for stewed eels declare the flavour and delicacy to be far superior to similar preparations; and it is certain that the dish forms a very light and nourishing article of diet. Like most kinds of fish, eels have lately been increasing in price; whether this is owing to the fact that they are rising in popular estimation, and that the demand for them is increasing, or to the circumstance that the supplies are actually growing less, is a point which has incidentally been brought before parliament and the government, and on which many people will no doubt care to be enlightened.

Probably the most important eel-fisheries in England are those situated in the estuary of the Severn and the streams which run into that arm of the sea, and here not only full-grown eels, but the fry of eels, called 'elvers,' are captured in large quantities.

In this connection we may refer to a popular belief that eels are self-produced; that they are evolved from the mud found in most river-beds and ponds. Indeed hardly any common fish has had more fallacies promulgated concerning it than the eel, although it is universally distributed, and is perhaps as prolific as any creature in the waters. It is said by some to be viviparous—that is, bringing forth its young alive. Its power of travelling over land has endowed it, in the imagination of certain persons, with the possession of feet. The minuteness of its scales has caused it to be declared 'scaleless.' The curious 'air-bladders,' so called—which are really intended as reservoirs for water to moisten the gills of the fish when travelling out of the water—have been held to prove that it is properly an air-breathing creature, which occasionally, like some snakes, sojourns in the water for reasons of its own.

These and other superstitions which have prevailed concerning the fish, are the more extraordinary when we remember how universal is its distribution, and how its great tenacity of life has given opportunities for carefully examining its physiological nature, which are not always to be met with in the case of other fish.

Like almost every other fish, eels are oviparous, the spawning usually taking place in the brackish waters of estuaries, whence the young fry, called 'elvers' or 'eel-fare,' soon migrate up-stream in countless myriads. In the Severn this fact is taken advantage of by the fishermen, who reap an abundant harvest of delicious food during the months of March, April, and May, when other kinds of fish are scarce. The adult eels are caught in their progress down the streams in the latter months of the year, in most parts of England; but it is principally in the Bristol Channel and its tributary streams that the capture of 'elvers' is practised. The origin of this word is not perfectly known. It is probably a corruption of 'eel-worm,' or, as Yarrell suggests, of 'eel-fare,' the word 'fare' being used originally in the sense of 'way-faring,' and referring to the passage of the eels up the rivers. But whatever its origin, the inhabitants of Gloucestershire, Somersetshire, and neighbouring counties prize their eel-fare very highly, and tons upon tons of these minute creatures are caught and used for food every spring. As a rule they are boiled and pressed into cakes, in which shape they can be easily transported.

According to the evidence given at a recent official inquiry, an attempt has been made to deprive the people of the right to take these elvers, an attempt they have strongly resisted. It is alleged that, notwithstanding the enormous destruction which takes place night after night, the quantities of eel-fry are so immense that no appreciable effect is made on their numbers. They are described as swimming in compact masses several miles in length, and finally distributing themselves over the tributary streams, and even in the ditches, ponds, and lakes of the country. The curious point is that only an infinitesimal proportion ever descend as adult fish to perpetuate their species, and yet year after year the same marvellous reproduction is repeated; thus proving the wonderful productiveness of the fish. Indeed the ova are so minute that they are scarcely discernible by the naked eye, so that each parent eel must produce many hundreds of thousands—perhaps millions—of young in a season.

These facts are curious and, we imagine, not generally known; and without attempting to deduce any moral from them, as regards the desirability of cultivating such a vast source of food-supply, we have recounted them for the information of our readers. Perhaps some of them who have not already done so may be inclined to test for themselves the merits of 'eel-fare,' whether in the shape of the adult fish or their minute fry.

The value of eels as an article of food may be estimated from the fact that though, as we have said, they are not equally appreciated in all parts of this country, as many as ten vessels are constantly engaged in bringing eels to London from Holland alone, in quantities varying from fifteen to twenty thousand pounds-weight in each cargo, in addition to the supply which our own rivers and lakes afford.

ARIADNE.

When Theseus landed in Crete with the offerings of the Athenians for the Minotaur, Ariadne, the daughter of Minos, king of the island, conceived a passion for the handsome stranger, and helped him to slay the monster. Theseus and Ariadne then escaped together, and sailed to the island of Naxos, where, according to the favourite legend, Ariadne was abandoned by her lover and left asleep on the strand. She was found sleeping by Dionysos or Bacchus, who, enchanted with her beauty, married her, and after her death gave her a place among the gods. In another version of the story, Ariadne is related to have been killed at Naxos by Diana.

SAILED the ship from dreaming Naxos ere Aurora tinged
the sky
With the breaking clouds of promise that the day was
drawing nigh,
While the winds who used to woo her filled her sails with
one low cry—

Ariadne!

Bowed the trees in awe-struck wonder, for a fear lay on
the land;
Moaned the seas as if in anguish, dashing wildly on the
sand;
Wind and waves their voices mingling, half entreaty, half
command—

Ariadne!

Drooped the flowers in wistful clusters; ran a shiver
through the dells;
Trailed the eglantines' sweet blossoms, shook the lilies'
fairy bells,
As a wail ran through the valley, breaking sadly into
swells—

Ariadne!

Passed the dawn in fitful shadows; to his car the Sun-god
stepped,
Casting down a softer glory where the Cretan Princess
slept,
While one tiny wifful sunbeam whispered softly as it
crept—

'Ariadne?'

Spoke the lilies all a-tremble, hiding low their heads in
shame:
'Let the south wind bear our message; Theseus may return
again;
Let our presents be sweet odours, and our song the maiden's
name—

Ariadne.'

Sped the south wind on its journey, ever singing as it
wot—
'Back; return to mourning Naxos; Ariadne is for-
got.'
Round the ship spread sweetest odours; Theseus heard,
but answered not.

Ariadne.

Landward flew the breezes, madly lashing all the seas
afoam;
Curled the waves up white in anger with a weird
unceasing moan,
Till they formed one mighty chorus—the refrain—'Alone,
alone,

Ariadne!'

Trembled trees through leaf and branches for the sleeping
maid of Crete,
Trailed the eglantine so lowly that it almost kissed her
feet,
Bud and blade and tendril joining in a lullaby so sweet,
'Ariadne.'

AN ECCENTRIC LADY.

THAT 'Truth is stranger than fiction' is an axiom of which the justice is generally acknowledged but so seldom realised, that whenever we hear of some event rather out of the common course occurring to any of our friends, we find ourselves involuntarily describing it as being 'like a romance!' And yet the wildest work of fiction ever penned has rarely contained incidents more extraordinarily improbable than those which have marked the career of the heroine of our present story, and which, little edifying in many respects although they be, may nevertheless serve

To point a moral and adorn a tale.

Jane Elizabeth, Lady Ellenborough, if we may trust the matter-of-fact pages of *Lodge's Peerage*, is the only sister of the present Lord Digby, being daughter of the late Admiral Sir Henry Digby, G.C.B., great-grandson of the fifth Lord Digby; her mother was a daughter of Thomas William Coke, of Holkham, the veteran M.P. for Norfolk, and well-known agriculturist, afterwards created Earl of Leicester. She was born in April 1807, and when little more than seventeen, was married to the late Lord Ellenborough (the Governor-general of India); but the union was dissolved by act of parliament in 1830, 'on account of her elopement with Prince Schwartzberg.' She married as her second husband, two years later, Charles Theodore Herbert, Baron Vennigen, of Bavaria.

It is probable that this alliance lasted but a short time, at least if any credence may be attached to the account of a correspondent of the Vienna *German Gazette*, who writes thus from Beyrout in 1872-3: 'I met to-day an old acquaintance, the camel-driver, Sheikh Abdul, and he told me that his wife has died. Abdul spoke well of the woman. Her name was once known all through Africa. Sheikh Abdul is the ninth husband of Lady Ellenborough, whom I met for the first time about thirty years ago at Munich, just after she had eloped with Prince Schwartzberg from the resi-

dence of her first husband. She then went to Italy, where, as she told me herself, she was married six times in succession. Each and all of these unions were dissolved after a short duration. In 1848 I met her at Athens, where she concluded an eighth marriage with the Greek colonel, Count Theodoki; this, however, also lasted only for a short time. Her affections were now bestowed on an old Palicar chieftain, for whom she built a beautiful house at Athens. When her latest marriage was again dissolved, she went to the Levant.'

It would seem as if the old satirist Juvenal must have had Lady Ellenborough in the 'prophetic eye' of his mind when he wrote of a Roman lady some eighteen hundred years ago—

Thus in autumns five
Eight husbands doth she wed—a worthy thing
To note upon her tomb.

The paragraph from the *German Gazette* above quoted having gone the round of the daily papers, gave occasion for a variety of obituary notices of the ex-Lady Ellenborough, dwelling in not very complimentary terms upon certain parts of her singular career of adventure. It subsequently appeared that the news of her death was quite premature, and that the report had been originally put into circulation by one of her ladyship's and her second husband's bitterest enemies in the neighbourhood of Damascus, which she had made for some years her head-quarters, opening her eastern home to all sorts of visitors from the West, as well as to her oriental friends. The rumour of her death was effectually contradicted a few months later by a letter in her own handwriting, addressed to an English lady, who was well acquainted with her in Damascus. This lady and her husband had mourned old Lady Ellenborough for two or three months as having died in the Desert, and had quite given up all hope of ever seeing her again, when one day they received from her a letter stating that she was alive and in the best of health, and asking her to contradict the rumour of her decease.

Lady Ellenborough was fortunate in the possession of at least one sincere friend, generously eager to defend her when attacked, and to make out the best case possible for her. Mrs Isabel Burton, who had been intimately acquainted, and in the habit of daily intercourse with this extraordinary woman, during a residence of two years in Damascus, while her husband, Captain Burton, was the English consul at that city, appears to have contracted a warm attachment for her, and speaks of her, in spite of all her faults, in terms of the highest praise. To Mrs Burton, Lady Ellenborough confided the task of writing her biography, and dictated it to her day by day until the task was accomplished. In a letter to the *Pall Mall Gazette*, written in March 1873, when under the belief that Lady Ellenborough was dead, Mrs Burton says, in allusion to this biography: 'She did not spare herself, dictating the lad with the same frankness as the good. I was pledged not to publish this until after her death and that of certain near relatives.'

Mrs Burton subsequently adds: 'I cannot meddle with the past without infringing on the biography confided to me; but I can say a few words concerning her life, dating from her arrival in the East, as told me by herself and by those now living there; and I can add my testimony as to what I saw, which I believe will interest every one in England, from the highest downwards, and be a gratification to those more nearly concerned. About sixteen years ago, tired of Europe, Lady Ellenborough conceived the idea of visiting the East, and of imitating Lady Hester Stanhope and Lady Mary Wortley Montagu, not to mention a French lady, Mme. de la Tour d'Auvergne, who has built herself a temple on the top of Mount Olivet, and lives there still. Lady Ellenborough arrived at Beyrout and went to Damascus, where she arranged to go to Ikkad across the Desert. A Bedouin escort for this journey was necessary; and as the Mezrab tribe occupied the ground, the duty of commanding the escort devolved upon Shaykh Mijwal, a younger brother of Shaykh Mohammad, chief of this tribe, which is a branch of the Great Anazeh tribe. On the journey the young Shaykh fell in love with this beautiful woman, who possessed all the qualities that could fire the Arab imagination. Even two years ago she was more attractive than half the young girls of our time. It ended by his proposing to divorce his Moslem wives and to marry her; to pass half the year in Damascus—which to him was like what London or Paris would be to us—for her pleasure, and half in the Desert to lead his natural life. The romantic picture of becoming a queen of the Desert and of the wild Bedouin tribes exactly suited her wild fancies, and was at once accepted; and she was married, in spite of all opposition made by her friends and the British Consulate. She was married according to Mohammedan law, changed her name to that of the Honourable Mrs Digby El Mezrab, and was horrified when she found that she had lost her nationality by her marriage, and had become a Turkish subject. For fifteen years she lived as she died,* the faithful and affectionate wife of the Shaykh, to whom she was devotedly attached. Half the year was passed in a

very pretty house which she built at Damascus just without the gates of the city; and the other six months were passed according to his nature in the Desert in the Bedouin tents of the tribe.

'In spite of this hard life, necessitated by accommodating herself to his habits—for they were never apart—she never lost anything of the English lady, nor the softness of a woman. She was always the perfect lady in sentiment, voice, manners, and speech. She never said or did anything you could wish otherwise. She kept all her husband's respect, and was the mother and the queen of his tribe. In Damascus we were only nineteen Europeans, but we all flocked around her with affection and friendship. The natives did the same. As to strangers, she received only those who brought a letter of introduction from a friend or relative; but this did not hinder every ill-conditioned passer-by from boasting of his intimacy with the House of Mezrab, and recounting the untruths which he invented, *pour se faire valoir*, or to sell his book or newspaper at a better profit. She understood friendship in its best and fullest sense, and for those who enjoyed her confidence it was a treat to pass the hours with her. She spoke French, Italian, German, Slav, Spanish, Arabic, Turkish, and Greek, as she spoke her native tongue. She had all the tastes of a country life, and occupied herself alternately with painting, sculpture, music, or with her garden flowers, or poultry, or with her thoroughbred Arab mares, or in carrying out some improvement. She was thoroughly a connoisseur in each of her amusements or occupations. To the last she was fresh and young; beautiful, brave, refined, and delicate. She hated all that was false. Her heart was noble; she was charitable to the poor. She regularly attended the Protestant church, and often twice on Sundays. She fulfilled all the duties of a good Christian lady and an Englishwoman. She is dead. All those who knew her in her latter days will weep for her. She had but one fault (and who knows if it was hers), washed out by fifteen years of goodness and repentance. Let us hide it, and shame those who seek to drag up the adventures of her wild youth to tarnish so good a memory. *Requiescat in pace.*'

But Lady Ellenborough was not dead. It will, of course, be obvious that along with Lord Brougham, she has been privileged to read the obituary notice of her own career; and she is probably destined to see many more summers and winters in her Arab home.

It is evident from the tenor of the last few sentences of the foregoing letter, that the 'one fault' to which the writer alludes was the elopement of Lady Ellenborough with Prince Schwartzenberg, and that Mrs Burton entirely disbelieves in the half-dozen or more of apocryphal husbands intervening between Lord Ellenborough and the Arab sheik. At anyrate, the eccentric lady is entitled to the benefit of the doubt; and public curiosity respecting this extraordinary woman must remain unsatisfied until the period shall arrive when her friend and confidante, Mrs Burton, will be at liberty to publish the autobiography committed to her charge.

It would be possible, without difficulty, to draw at once a parallel and a contrast between the eccentric Lady Ellenborough and the scarcely less eccentric niece of the younger Pitt, Lady Hester

* This was written at the time when the report of Lady Ellenborough's death was generally believed to be true.

Stanhope, whom I have named above, and who, more than half a century ago, exchanged English life, habits, and sentiments, and possibly also to some extent her faith as well, for those of the wild and romantic East.

CURIOSITIES OF PATENTS AND PATENTEES.

THE characteristics of men are as much shewn in the taking out of patents as in many of the more important transactions of life. Some persons are proud of possessing 'Her Majesty's Royal Letters-patent,' as if the possession implied a special token of royal favour conferred on the fortunate recipient. Some imagine that the smallest exercise of inventive power ought to bring to them a rich reward, which a patent will in some mysterious way insure; while others, with a little further knowledge of the subject, nevertheless delude themselves into a belief that their particular inventions are certain to be of immense benefit to society.

One of the curiosities of patents is shewn in the inability of many patentees to discriminate between a *discovery* and an *invention*—the one relating to a scientific principle, the other to a practical application. By the English law, and (we believe) by the laws of other countries, it is only a practical application of some already-known scientific principle that can be patented, not the discovery of a new principle. Sir Isaac Newton discovered the great principle or law of universal gravitation; but he could not have patented it. And the successors of Newton have in like manner been debarred from obtaining patent rights for the great scientific discoveries made by them. In our own immediate day, Mr Joule has rendered immense service to science, engineering, and the practical arts by determining the mechanical equivalent of heat; but it is not an *invention*; he cannot patent it, although hundreds of persons may, and probably will, obtain patents for mechanical inventions based on this principle of equivalence (that is, a definite amount of work or mechanical energy produces a definite amount of heat; and *vice versa*). Many a would-be patentee has come to the ground through inattention to this difference between discovery and invention.

Another of the curiosities is the blissful ignorance of many patentees that their patented inventions are old; that the apparatus or the process was known long ago, whether patented or not. A man (say) notices that when his shirt-button comes off with provoking facility, some little contrivance at the back would render it more secure; he invents and patents a contrivance; and then finds to his cost that it had been already known and tried. The number of patents invalidated on this ground almost exceeds belief; the inventors have not obtained the preliminary information necessary for knowing what had been done by other men before them.

Unless one be very certain that his invention has never occurred to another and by him been patented, the result is frequently disastrous. The state, deriving a large revenue from the granting of patents (how large, we shall shew presently), cares little and does little towards rendering the patent what it ought to be. In such a case as

the supposed shirt-button, for instance, the state virtually says: 'John Brummagem must find out for himself whether his new button-fastener is new or old; it's no business of *ours*; all we do is to go through the formalities, issue the documents, and take the fees.' And then, when other makers of shirt-buttons are proceeded against at law for infringing the patent, the pursuer has the sweet additional satisfaction of paying all the law expenses, besides losing his supposed patent right. Some of the most memorable incidents in the history of inventions are the great legal struggles concerning the novelty of the subject patented. The famous *Torbane Mill* trial, to determine whether the substance from which Mr Young obtains his paraffin is a 'mineral' or 'coal,' lasted thirty days, and cost a prodigious amount of money. Neilson's *Hot Blast* was the subject of a patent which ran away with nearly a hundred thousand pounds to establish its legal validity against a host of infringers. The Patent Capsules for covering bottles were bartered about from one court of law or of equity to another for five years, at a cost of tens of thousands of pounds. True, these three celebrated cases ended in favour of the patentees; but they equally well illustrate our meaning—that the State, in issuing a patent and taking the fees, leaves the patentee to find out for himself whether his patent holds good in law or not. And it requires almost a Mark Tapley in 'jollity' of disposition for the patentee to bear with equanimity the fact that scientific witnesses are well nigh as numerous on one side as the other, at most of these trials.

We hardly know whether to class as a curiosity the tendency of many patentees to regard the government as a gold mine, to be worked for their special benefit. Some persons look at the government or the state as the holder of vast treasures of money, forthcoming to reward deserving men whenever the ministers of the day may choose to dip into the coffers. The inventors of warlike appliances place hardly any limit to the magnificence of the reward which they think 'the government' ought to make them. One patentee offered to sell to the state, for five thousand pounds, the patent for a new projectile, with an additional ninepence for each and every shot made. Another named eight thousand pounds as a reasonable price for his newly invented shell. A third asked ten thousand pounds for a new muzzle-stopper. But these are modest men compared with an inventor who demanded from the government the sum of one hundred thousand pounds for a patented plan for strengthening guns. Another feature, which we may call a curiosity or not as we please, is the roundabout and entangled language in which many inventions are described by the patentees. Want of clearness in what is termed the specification leads to no end of disappointments to all concerned.

Curious beyond all question is the vastness of the number of inventions which have passed through one or more of the formalities of patenting. By the end of 1875, in connection with our own country alone, they exceeded ninety thousand; and as they grow at the rate of something like four thousand in twelve months, the round number of one hundred thousand will be nearly reached by the end of 1877. In some

departments of invention the patents are indeed formidably numerous—two thousand for firearms of various kinds; twenty-one hundred for processes of plating and coating; twenty-two hundred for furnaces and fireboxes, and an equal number relating to the various operations and apparatus of the printing-office; twenty-six hundred for heating and evaporating appliances; twenty-seven hundred for various india-rubber and gutta-percha appliances; thirty-four hundred for railway carriages and plant; four thousand for modes of air-supplying; forty-three hundred for propelling and driving mechanism, and about an equal number for spinning fibres into yarn and thread; forty-five hundred for applications of motive-power; five thousand for weaving and braiding; six thousand for steam engines and boilers; and not much less than seven thousand for various substances and processes relating to metallurgy and metal-working. Some of the groups tabulated by Mr Bennett Woodcroft, the able chief of the Patent Specification department, are noticeable for the oddity of the subjects rather than for the number in each group. Beehives and beeswax, coffins and tombstones, covers for coal-holes, cricket-bats, destroying rats, dramatic and scenic effects, extinguishing flames, garden-pots, garters, hair-dressing, hatching and breeding, hearses, hooks and eyes—what a whimsical medley is here! Not less so such as the following: vermin destroying, matches and fuses (four hundred of these patents), medical treatment, mole-traps, nut-crackers, petticoats and skirts, pigeon-shooting, rags and waste, raising sunken ships, kettles and sauce-pans, sepulchral monuments, singeing pigs, stays, window price-tickets, tags, thimbles, trousers and drawers, voting machines (sarcastic politicians assert that illiterate electors are often little better than voting machines; but here the patentees refer to some kind of ballot-receiving boxes).

The number of stages through which a patent has to pass in order to obtain its full fourteen years' validity, is not less a curiosity than many of the matters we have hitherto noticed. An intending patentee, willing (more or less) to pay for the honour conferred upon him, prepares, or gets a patent-agent to prepare for him, a petition announcing his wish to obtain patent rights for a certain invention; also a provisional specification setting forth briefly the nature of his apparatus or process, and mostly accompanied by a sheet or sheets of diagram drawings; also a declaration asserting that all the statements in the petition are, to the best of his knowledge, true concerning the originality and usefulness of the invention. These three documents, together with a fee of five pounds, are handed in at the proper office. The Crown refers the matter to the law-officer (nominally the Attorney-general or Solicitor-general, but really a clerk), who examines the provisional specification to see whether it reads intelligibly, &c.; the examination is little more than a mere form, for many of the specifications of those which pass are dreadfully confused and *unintelligible*. The law-officer gives his approval in the form of a certificate; and then the Great Seal Office awards the petitioner provisional protection for six months. So far good. At the end of the six months he decides whether he will let the matter drop, and lose his five pounds, or whether he will give notice of intention to proceed, and pay another sum of

equal amount. Unless objected to by some other person, and the objection maintained before the law-officer sitting as a presiding judge, the law-officer makes out a warrant, the letter-patent is drawn up in verbose official language, the petitioner applies for the sealing of the patent, he sends in a final specification, and at length becomes a full-blown patentee, after paying five sums of five pounds each. No, not full blown; the patent in this form lasts only three years. At the end of the third year, if his invention does not turn out well, he makes no attempt to obtain a prolongation of his rights; but if the prospect be fairly good, he pays a further sum of fifty pounds, for which his patent is endowed with four more years' lease of life. At the end of seven years, if he still likes the appearance of affairs, he pays one hundred pounds, and obtains a prolongation of his patent for an additional seven years. Thus it is, then; every patent for fourteen years costs the patentee, first and last, a hundred and seventy-five pounds in fees and stamps, besides patent-agent expenses.

Does every applicant for a patent go through all these forms, and pay all these instalments of money? The answer to this question is itself a curiosity. Out of a hundred petitions for patents, it is found that only seventy-five (on an average) proceed to the next stage; they fall to sixty-five by the time twenty-five pounds have been paid in fees; those that advance beyond three years are barely twenty in number; while those that survive seven years, and live on to their full maturity, are actually only four or five. Taking a wide range in order to arrive at a fair average, it is found that nineteen patents out of twenty come to grief by or before the end of seven years. There are four thousand applications for patents every year; the Patent Office receives the snug sum of one hundred and fifty thousand pounds a year in fees and stamps; and the patentees take their chance of a due return for this expenditure.

The most amusing part of the subject is connected with the inventions for which the patents are obtained—the oddity much more manifest than the importance, in so many instances. The first patents, issued in the time of James I., were more in the nature of monopolies or privileges, for which a 'consideration' was paid to shrewd Jamie himself. The very first patent of all was an exclusive privilege for drawing, engraving, and publishing maps of London, Westminster, Windsor, Bristol, Norwich, Canterbury, Bath, Oxford, and Cambridge. The next was for the privilege of publishing portraits of His Sacred Majesty. The third was for an unexplained group of wonderful inventions; for ploughing land without horses or oxen, making barren land fertile, raising water, and constructing boats for swift movement on water.

Many of the patents relating to clothing are singular either for their immediate objects or for the language in which they are couched. One patent for breeches, at a date when trousers had not yet come much into use, described a mode of cutting out and making 'to do away with all the inconveniences hitherto complained of'—by the aid of elastic springs, morocco elastic supporters, straps, buckles, &c. Another 'protects trousers from mud,' by means of a shield attached to the hinder part of the boot-heel, which shield receives the splashed mud. Martha Gibbons, early in the

present century, patented 'a certain new stay for women and others, called the "*Je ne sçais quoi* stay;" which may be padded in any part when required for persons to whom Nature has not been favourable'—probably a euphuism for 'flat figures.' George Holland patented a mode of 'making false or dummy calves in stockings.' A famous *modiste* has an improvement in ladies' dresses, 'rendering the same body capable of adapting itself to fit different figures.' For those 'who cannot bear a ligature round the leg,' a patentee has a garter made of steel springs, connected with a silver plate placed in the waistband of the dress. One patent tells of a machine for brushing trousers; a frame-work supports a spindle which carries a set of concave brushes; a cylinder of wicker or cane is placed inside the trousers to keep them distended; and the spindle is set rotating by an endless band acting on a bevelled pulley.

The searchers after a machine for producing Perpetual Motion—that dreamy fallacy of the middle ages—have not failed to make their appearance in the patent world. Mr Dircks has published a verbatim copy of a letter which shews that the 'Perpetuum Mobile' has by no means been banished from the minds of uninformed or half-informed inventors. In 1859 two Germans, Krause and Rotman, residing at Milwaukee in the United States, sent a letter to 'Her Majesty the Queen Victoria, Patent Office, London.' Her Majesty most likely did not read it, but the Patent Office folks did. It ran thus: 'Your Majesty, we humbly advertise that we find out the Perpetual Motion, a machine very singular in its construction, but the same time very important by the power it gives. We intend to secure ourselves the patent right for the United States; and as we are informed your Majesty has secured a reward for the invention, we respectfully ask your Majesty if we may come to shew our invention? To prevent mistake, we humbly beg not to believe any person without having the original patent of the United States, and the copy of this letter.'

From the cradle to the grave, patentees take care of us in some way or other. Even Dolly is attended to. One patent among many tells us that 'dolls hitherto made have never been so constructed as to allow of their being placed in a sitting posture, with the legs bending at and hanging down from the knees; and announces that this important desideratum has now at length been secured. Another inventor 'gives a rocking motion to dolls' cradles' by an elaborate array of clockwork, eccentric wheel, winch, and connecting-rod. One of the early patentees had 'a hydraulic, which being placed by a bed-side, causeth sweete sleepe to those which either by hott feavers or otherwise cannot take rest.' A patent medicinal powder, compounded of tobacco and herbs, was so meritorious that 'if one tablespoonful be struck for a dose up the nose as snuff, will cure various disorders of the hypochondriac and melancholy kind.' Eighty years ago many persons believed in a patented mode of curing numberless aches and pains 'by drawing over the parts affected various pointed metals, which from the affinity they have with the offending matters, or for some other cause, extract or draw out the same, and thus cure the patient.' One patentee has a thief-proof coffin, in which the corpse is secured by chaining or hooping it to a false bottom; and another

a coffin made impregnable by some special application of 'tappel and case-hardened screws.'

If we cut short our budget of curious patents, it is only because space fails us. Two of the Lily-whites, the celebrated cricketers, have at different times patented bowling-machines; in one instance for the adoption of machine-bowling in actual play; in the other only for practice at batting, when a trained bowler is not at hand. If the reader will imagine something of the catapult or cross-bow kind, he may form some idea of these cricketing oddities. One patentee has a balloon for catching fish; a balloon, inflated with air and ballasted with water, is supposed to drag or trawl the fishing lines or nets. Before the Manchester and Liverpool Railway was constructed, a bright genius conceived the idea of using balloons to draw a ship overland between those towns, on a tramway of twenty feet gauge! A balloon has been patented for preventing sea-sickness; a platform, resting on a huge ball and socket, supports the seats for the passengers; the platform is connected by cords with a circle of small balloons, and the balloons are expected to keep the platform always horizontal—of course to the great satisfaction of the passengers. Balloons are also intended, by another patentee, to keep in motion the swings which are such a source of delight at country fairs. One of the very earliest patents was for 'a fish-call, very useful for the fishermen to call all kinds of fishes to their nets, speares, or hookes; and for fowlers to call severall kinds of fowles or birds to their neets or snares.' In one part the inventor speaks of his fish-call as a 'looking-glass'—rather a puzzle to interpret. Acrobats are invited to use a patent shoe soled with iron, which will enable the wearer, with the aid of a powerful electro-magnet, to walk head downwards along a metallic ceiling. There are patents for milking cows, for preserving the hands from chapping, and for curing the croup in fowls. Snuff-taking is made easy by 'two snuff-boxes, one with a slider and the other with a sweep, out of which snuff may be taken without pulling it (the box ?) out of the pocket, and without spilling.'

FALLEN FORTUNES.

CHAPTER XLIV.—IN THE COFFEE-HOUSE.

THE post flies quickly in town, and the next afternoon brought a letter from Mr Holt, in reply to Kitty's, and asking permission to call on the ensuing day. She was well aware of the significance of this request; he had called already without permission; but this would be altogether a different sort of visit; one wherein she could not deny nor excuse herself to him, and which would be paid to her alone. Even should he not ask the question upon which she knew he had so resolutely set his mind, this interview would be the forerunner to it, and in permitting it, she must needs foreshadow her reply.

To think was torture; to delay was vain. She sat down, and wrote a few words at once to say that she should be at home at the hour he had named.

The interval, which she had expected to pass in apprehensions of his arrival, was spent in fears

of another kind. Jenny grew much worse, so bad that, in spite of her (for Jenny had small confidence in unknown doctors), Kitty yielded to Nurse Haywood's advice, and called in the nearest practitioner.

'Aggravated febrile symptoms; nervous debility; and great cerebral excitement,' was his account of the patient. (He talked like a medical handbook, but he was by no means ignorant of his business.) 'The young lady requires quiet—freedom from anxiety of all sorts. How does she chiefly occupy herself?' asked he of Kitty.

'In reading and writing.'

'You mean by writing, composition? I thought so. The very worst thing for her in her present condition. Reading she must have in moderation; but pen and ink must be kept from her. And as soon as she is fit to be moved, I should recommend sea-air.'

Kitty bowed in assent—she believed him the more because Jenny had always been recommended 'Brighton' in the spring—and blushing, tendered him one of her ten guineas.

'You have not lived in Brown Street long,' he said, smiling. 'Science is cheaper here than in some places.' And he returned her thirteen shillings and sixpence. Freedom from greed is one of the many virtues of the medical calling; but to poor Kitty this seemed only another proof how pitiful must be the case of her and hers, since even strangers compassionated it, and returned her money.

'Perfect rest' and 'sea-air.' The prescription was doubtless good, but could only be carried out in one way—at her own proper cost. If she had hitherto entertained a doubt of the sort of reception that she should give to Mr Holt, she had none now. And yet things did not happen quite as she expected.

Mr Holt came indeed with the punctuality of clockwork, but matters had become by that time so serious with Jenny, that little else could be alluded to.

'I am very much shaken and unnerved,' said Kitty pleadingly; 'you must forgive me if I do not acknowledge your late kindness as it deserves.'

'It deserves nothing,' returned Mr Holt. 'I hope you will not pain me by alluding to such a *bagatelle*.' (He would air his French, even to her.) 'But if I can be of real use, pray, command me. Now, with respect to Brighton'—

'My sister cannot be moved for weeks,' interrupted Kitty quickly; 'she is very, very ill.'

'Still, when she *can*, I adjure you to remember that the means will not be wanting. If your father were—were in England, do you suppose he would spare any expense for such an object? A hundred pounds, or a thousand; what does it matter? We have a saying in the City that "money may be bought too dear," but that does not apply to life.'

His manner was most respectful, and yet tender; he took her hand in his, and pressed it as he said the words, 'Money may be bought

too dear,' which was inopportune, to say the least of it. But she did not withdraw her hand.

'I entreat you,' he went on, 'not to add to your real sorrow, by worrying yourself about pecuniary troubles; for so long as Richard Holt is alive they are visionary. I shall send or call to inquire daily; but I shall not intrude upon you while your sister remains so indisposed—unless it would be any relief to you to see me,' added he, with gentle pleading.

'You are very, very good,' said Kitty. 'I am not fit to see any one just now.'

If he had hoped for any other answer, he did not shew it. His behaviour was the perfection of patience and devotion. Kitty would have felt really sorry for him—as her mother had done—if she had not been so wretched on her own account. It was impossible to doubt that the man loved her; and to be loved without return is almost as bad (to a kind heart) as to love under the like circumstances.

'Did you walk?' inquired she, mustering some show of interest in him, as he took his leave.

'No; I rode: my horse is at the corner of the street. I left it there because Mr Derwent told me that your sister was so ill, and I feared the noise would disturb her.'

This was thoughtful of him in one way, but he was foolish to have mentioned Jeff; it somehow stopped her thanks.

'Good-bye,' he said, 'my dear Miss Dalton; or rather, I should say *au revoir*.'

He came the next day and the next, but had no speech with Kitty. Her place was by her sister's pillow, and she could not leave it. Thus once more it happened that by a caprice of Fate she was saved by one species of misery from the endurance of another. Weeks went by without much alteration in the condition of the sick girl; and then the spring came, and with it a little renewed vigour. In the meantime, her story had appeared in the *Smellfungus Magazine*, and achieved what in the periodical world is held to be a success. A second edition of that serial—the first had not been a very large one—had been called for in consequence. Mr Sanders had written to Jeff a cautiously expressed letter of congratulation, bespeaking a 'more sustained work' from the same 'gifted pen, combining fiction with antiquarian details.'

'The beggar takes me for Walter Scott,' was Jeff's observation. Yet he could hardly smile at this new proof of the editor's misplaced confidence, for he knew that many a month must pass away before she, whose representative he was, could resume her pen, even if she could ever do so.

He wrote to say that indisposition would incapacitate him for the present from writing for the *Smellfungus*; and the next day Mr Sanders met him at luncheon-time in a City oyster-shop eating like Dando and drinking stout.

'You are writing for something else, you know you are,' exclaimed the editor with a burst of

irritation. 'I should have thought the author of "The Monk of Monkwearmouth" [Jenny's successful tale] had been more of a gentleman.'

'He is nothing of the kind, and never made any pretensions to it,' said Jeff coolly.

Mr Sanders thought him more like Chatterton than ever.

One morning, Mr Holt received a telegram, which, as was usual with him, he opened in Jeff's presence. His table was covered with letters every morning, yet he received more telegrams than letters; and none of these various communications ever seemed to move him. But on this occasion, he leant back in his chair, and turned deadly pale.

'Are you ill, sir?' said Jeff with interest.

'I feel a little faint: it is the spring weather. Get me a draught of water.'

When Jeff brought the glass, the telegram had disappeared, and his employer was consulting *Bradshaw*.

'I shall have to go away from office to-day,' said he, speaking more thickly than his wont. 'I have been summoned to—Plymouth. There will be no business of any importance to transact, I believe.'

'Very good, sir. In case any one wishes to see you, when shall I say you will be back?'

Mr Holt did not answer; he seemed to be in difficulties with his *Bradshaw*, a work which he had generally at his fingers' ends.

'Tell the boy to fetch me a cab, a Hansom,' said he presently. 'There is not a minute to lose,' added he, as if to himself. Then, before Jeff could leave the room, his employer uttered so terrible an execration, that the young fellow turned to look at him in astonishment. He had never heard him swear before, and it really seemed as though he were making up for past omissions in that respect. Mr Holt's usually calm face had become a sea of passion.

'I said a cab,' exclaimed he imperiously. Jeff himself flew for a Hansom, and as he caught one passing the archway out of the court, Mr Holt was at his heels. He did not seem to notice him, and perhaps took him for the boy, as he leaped into the vehicle.

'King's Cross— and drive like the devil,' was his direction to the cabman. And the man drove off at the pace supposed to be affected by his Satanic majesty.

In his hurry and passion, had his employer given the wrong address? thought Jeff. Or had his statement that he was going to Plymouth been an untruth? Certainly King's Cross was not the station for that town.

He had left his letters behind him unopened; even those from Liverpool, where he had a small branch establishment, and which generally claimed his first attention. Something serious had certainly occurred.

At eleven o'clock arrived Mr Dawkins, a pretty frequent visitor in Abdlall Court. He appeared greatly excited; his neckcloth, always tight for his large throat, seemed almost to suffocate him, making his face to swell and his eyes to project in a very alarming manner. 'Where is your master?' inquired he hurriedly.

'Do you mean Mr Holt?' replied Jeff with stiffness. 'He is gone away. A telegram arrived for him this morning which took him out of town.'

'Ay; to Liverpool, of course,' said Mr Dawkins. 'Then the news is true, I suppose?'

'What news?'

'Look here, my young fellow,' said Mr Dawkins persuasively, 'everybody must know it by this evening, and before your employer comes back: it is a question of hours. You cannot possibly do any harm by telling me just "Yes or no" about the *Flamborough Head*. I can make it well worth your while;' and he tapped his breast-pocket, which was always bulging with bank-notes.

Jeff looked at him severely. 'No!' roared he. He was very angry, but he knew that words—as a vehicle for moral sentiments at least—would be wasted upon Mr Dawkins.

'Do you mean that the news isn't true, or that you won't take the money?' asked Mr Dawkins.

'I don't know the news, and I don't want your money,' answered Jeff contemptuously.

'This is ridiculous,' said Mr Dawkins, regarding him attentively. 'Look here, young man: if anything should happen to your employer—I don't say it will, mind, but if it should—you may hear of something to your advantage by calling at this address.' He pulled out a card and threw it on the table. 'What luck Holt has!' he murmured as he left the room. 'But where on earth could he have ever met with such a boy?'

Just before one o'clock, Jeff the Incorruptible had another visitor. A commissionaire called with a note for 'Geoffrey Derwent, Esq.' *Immediate; bearer waits*, was underlined upon the envelope.

'Are you Mr Derwent?' inquired the messenger scrutinisingly; 'because I was to give this into your own hands.'

'It is all right, my man. Are you from Islington?'

Jeff was afraid there might be bad news from Brown Street, where he called every night and morning.

But the handwriting of the letter, which consisted of but a few words, was strange to him: 'A friend wishes to see you at once upon important business at the *Good Templar's Coffee-house*, Ludgate Hill. Please keep this communication private. Ask for Mr Phelps.'

When Jeff looked up, the messenger had vanished.

This young gentleman was not of a romantic turn of mind. 'I believe it's Sanders, who wishes to keep me under lock and key till I shall have produced a three-volume novel,' mused he. 'In that case I shall be a prisoner for life. Or perhaps it's a dodge to get into the office.' This last idea seemed probable enough; and before Jeff left, he gave the policeman a hint to look after the premises in his absence, since the boy in charge was but an inefficient guard. It was his own time for dinner; so he had no compunctions about spending some portion of his usual hour in answering the mysterious summons, which considerably excited his curiosity. There was a tectotal smack about the *Good Templar's Coffee-house*; but none of Jeff's acquaintance were teetotalers, having most of them the power of imbibing spirituous, or at least malt liquors, without getting hopelessly intoxicated. Perhaps, after all, the whole thing was a hoax, to which species of humour the young gentlemen of the Stock Exchange are almost as much given as their seniors. At all events, Jeff was resolved to see it out. As he passed by

Lloyd's, two men pushed by him talking eagerly, and he thought he heard one of them mention the *Flamborough Head*. Was it humanly possible that that vessel had come safe to port, after so many weeks and months? His reason told him it was not; yet still the incident, taken into connection with Holt's summons to Liverpool and Mr Dawkins' hint about great news, was curious. The *Good Templar's Coffee-house* was a third-rate establishment, situated, not in the main thoroughfare of Ludgate Hill, but in one of the small streets to the south of it. So unpromising indeed was its appearance, that had it been evening instead of noonday, Jeff might have hesitated to enter it on such an invitation as he had received. But as it was, he walked in unconcernedly enough, and inquired of a very dirty waiter, who was lounging in the passage with a napkin under his arm that matched his linen, for Mr Phelps.

The man nodded, and led the way through a swing-door into a low-roofed and dingy coffee-room, arranged in compartments like tall old-fashioned pews.

'Gent for Mr Phelps,' said the waiter sharply; and immediately from the farthest corner there emerged a stranger, and came forward to meet the visitor.

A stranger, as I have written, he was to Geoffrey Derwent, and yet there was something about the man not wholly unfamiliar to him. His face was dark and wrinkled, and his hair was gray; but his eyes were bright and piercing. He had never seen so old a face with eyes so young before, save once.

'It was good of you to come so soon, Mr Derwent, and on so unceremonious a summons,' said he, in grave tones. 'Oblige me by sitting down for a few minutes and hearing what I have to say.'

He pointed to a seat in the compartment next to that from which he had risen, and lighted better than most by a dusty window.

Then Jeff could see that the man was curiously clothed, like one who has just come from travel in foreign lands, and to whom either time or means has been wanting to equip himself like other people. The latter was probably the case in this instance, for even such clothes as he had were worn and threadbare, as well as being of too slight a texture for the season.

Jeff gazed at him long and earnestly; while his new acquaintance, as though to give the opportunity of doing so, drew out a note-book and cut a pencil.

'We have met before, I believe, Mr Derwent?' said he presently, as if in reply to this examination.

'Never. But you bear a strong resemblance to one very dear to me, though you are an older man.'

'You mean John Dalton?'

'Yes.'

'I am his half-brother, Philip Astor,' returned the other, still more gravely than before; 'and it is of John Dalton that I wish to speak with you.'

'Have you any news of him, sir?' inquired Jeff eagerly. 'Your tone gives me little hope; and yet there is a report—or at least some sort of talk—in the City that the *Flamborough Head* has come into port.'

'Indeed!' returned the other with some surprise. 'I am sorry to say, however, the news is

false. You are acquainted, I believe, not only with my half-brother, but with his family. Be so kind as to speak out, as I am a little deaf.'

'I am well acquainted with them,' answered Jeff in distinct tones: 'they are the dearest friends I have in the world.'

'And yet they are in bad circumstances, I understand?'

'They are not rich. When one says "dear," one does not always mean a money value,' returned Jeff coldly. He began to dislike this man, with whom, too, he now remembered Mr Dalton had had some sort of quarrel or litigation.

'The object of my inquiries is a friendly one, I do assure you,' observed the other, reading his thoughts. 'I wish to be assured of our friends' welfare, that is all.' He paused; then, with a slight tremor in his voice, continued: 'Are they all well?'

'Kitty is well.'

'And still Miss Kitty, I suppose?' put in the other quickly.

'Certainly,' returned Jeff, with heightened colour.

'And she is not engaged to any one that you are aware of? Well, well, I only asked, meaning no offence. And how are the rest of them?'

'Jenny has been very ill, but she is getting somewhat better. She was always delicate, as you are probably aware; and her poor mother's death—'

'I know, I know,' interrupted the other hastily: 'that sad news has already reached me.'

A heavy sigh broke forth from somewhere in the darkness of the room.

'What is that? We are not alone,' said Jeff angrily. 'I do not choose to speak thus of the affairs of others in the presence of strangers.'

'It is a friend of mine in the next box.'

'I don't care who it is. I won't—' Here Jeff stopped short, transfixed with awe.

A face was looking down upon him over the next partition which he had never thought to see again. It was a worn and weary face, older by ten years than when he had seen it last—as old as that of his present companion, senior (as Jeff knew) to him by many, many years—but it was that of John Dalton.

'Jeff, do you know me?' said a weak and half-choked voice, very different from those musical tones that had once won every ear.

'O yes, Mr Dalton. (God be thanked! What joy, what happiness, you will have brought with you!'

'Do you think so?' inquired the other eagerly, as they pressed each other's hands. 'Have they forgiven me, and yet not forgotten me—my dear ones?'

'Sir, they think of you and pray for you—I know Kitty prays for your return even yet—every day and night.'

'My Kitty, my own bright Kitty! Jenny, you say, is better. And the boy—dear Tony?'

'He is as blithe as June, sir, and as gentle. To see him watching by his little brother, amusing him—'

'Ay, there is another,' said Dalton gloomily. 'Her baby boy.'

'And as jolly a little baby as one would wish to see,' interposed Jeff cheerfully. 'He is the plaything of the whole house, though Kitty and he are

inseparables. They are all well, Mr Dalton, and need only to see their father's face again to be all happy.'

'God bless you, Jeff, for saying so! I did not dare to ask about them myself, but got Philip here to be my spokesman. Where are they all?'

'At Mrs Haywood's, in Brown Street. The old dame is delighted to have them, and they feel quite at home.'

'Perhaps there is not much temptation to leave it,' observed Dalton significantly. 'Are their friends kind?'

'O yes. There is Dr Curzon—he came up expressly to see Jenny; and, and— Why, who could help being kind to them?'

'I see one who could not help it; but I should like to hear of others. Tell me the truth, Jeff. Are my children quite deserted? Do none of all my old acquaintances visit the motherless and the poor in their affliction, for my sake or their own?'

'Well, you see, Jenny has been ill of late'—

'Was it infectious, then?' inquired the other apprehensively.

'No; it was not infectious; but when there is illness, it is well to keep a house quiet; and besides, Kitty made up her mind, when she found herself in charge of the family, and there was a necessity for great economy, to seclude herself as much as possible.'

'In spite of invitations and hospitalities,' said Dalton bitterly. 'I see. The Riverside people, however, have surely not forsaken them?'

'There was a misunderstanding with Mrs Campden, sir: Jenny returned some money that she had sent them or lent them; and there has been a breach.'

'And "Uncle George," he took his wife's part?'

'Upon my life, sir,' said Jeff earnestly, 'I don't think he could help it.'

'He must have some good in him, since you stick by him, Jeff,' answered Dalton with a faint smile.

'—You see how it is, Philip. There are just three—Dr Curzon, Mrs Haywood, and this one here. Just three. Think of it!'

'And a very good average,' returned Astor curtly. 'I have got one friend, just one. And perhaps I shall not have him long,' added he moodily.

'As long as he lives, Philip,' returned Dalton, quietly taking the other's hand.—'Jeff, you have stood by me, and mine. Take my brother also into your wide and loving heart. It is through him, next to God, that I am now alive. It is through him that those who, I have just heard you say—and bless you for it—were dearest to you, are about to be made happy. I cannot see them to-day—at least not yet. I have something to do first; something'—here his voice grew very harsh and stern—'that has nothing to do with happiness, but with woe, and wrath, and retribution. You are in Richard Holt's employment, it seems, as good men have been before you. Where is he?'

'He left his office this morning, he said for Plymouth, but as I have reason to believe, for Liverpool.'

Dalton and Astor exchanged significant glances.

'Ill news flies apace,' said the latter. 'What matters it? He cannot escape us.'

'That is true,' answered Dalton, in a slow tone of satisfaction. 'He would have to take my life ere he could do that.'

'And mine, John,' observed Philip in a tone of reproach.

'I know it,' returned Dalton with tender gravity; 'but you and I are one, brother.'

VARIETIES OF THE HEALING ART.

Of all sciences, that of medicine is perhaps one of the most widely interesting, because, although we cannot all be doctors, it is not unlikely that we will, most of us, one day sooner or later swell the world-wide class of patients. Viewing disease as not necessarily something either unnatural or malign, but rather as a disturbance of the bodily functions, which Nature is constantly endeavouring to rectify, nothing can be more instructive than to trace the progress and efforts of those men who, with greater or less enlightenment, have sought to aid her in the process.

It is not every day that we have presented to us a book so full of curious and interesting matter as *Doctors and Patients*, by the late Mr Timbs; and though we have already noticed it in these pages, we venture to hope that a few additional words may not come amiss.

A capital anecdote is told about a very famous man, although not a famous doctor, Oliver Goldsmith, whose medical career ended in the house of a lady, a personal friend of his own, one Mrs Sidebotham. He was prescribing for her, and he and the apothecary quarrelled over the dose, the lady siding with the compounder of drugs. This was more than the M.D. could stand; he rushed out of the room in a violent passion, and said to Topham Beauclerc, whom he met: 'I am determined henceforth to leave off prescribing for my friends.' 'Do so,' said the wit dryly. 'In future, when you undertake to kill, let it only be your enemies.'

Most people have heard of Abernethy's gruffness; here is an anecdote which shows how truly kind and liberal he could be at times. 'In the year 1818, Lieutenant D— fell from his horse in London, and sustained a fracture of the skull and arm. Mr Abernethy was the nearest surgeon, and being sent for, continued his attendance daily for months. When the patient became convalescent, he was enjoined by Abernethy to proceed to Margate and adopt shell-fish diet. The patient requested to know the extent of his pecuniary liability. 'Who is that young woman?' inquired Abernethy smilingly. 'She is my wife.' 'What is your rank in the army?' 'I am a half-pay lieutenant.' 'Oh, very well: wait till you are a general, then come and see me, and we'll talk about it.'

Next we have quacks, of whom there are, and always have been many. Adepts, jugglers, and dealers in charms were the first quacks; and then we have good Bishop Berkeley and his tar-water, which he seems to have been firmly persuaded was a specific for all the ills that flesh is heir to. The tar-water had its day, and was succeeded by Dr James's fever powder, and the pills of Morison the hygeist; both of which popular remedies, whatever their effect upon the public health might be, proved extremely beneficial to the pockets of their inventors. Dr James left a large fortune; and Morison died in Paris at the age of seventy, worth five hundred thousand pounds. Quacks of a meaner grade were in the habit

of perambulating the country, and appearing at all the village fairs, where their stage, with a drummer parading before it, and a merry-andrew casting somersaults behind the doctor's back, were among the most attractive exhibitions of the day.

The realms of quackery, like the more regular paths of medicine, were never entirely free from the invasions of the softer sex. One of the most notable quacks of her day was Mrs Mapp the bone-setter, who resided at Epsom. She was the daughter of a bone-setter named Wallin, and some have alleged that she was the sister of the celebrated actress who subsequently became Duchess of Bolton; but this, Mr Timbs says, is a mistake. However she acquired her skill, she was certainly very successful in her treatment of fractured bones, dislocations, and even of structural deformities, of which she was alleged to have performed some wonderful cures. She was a tall, raw-boned, exceedingly plain-looking woman; and her strength was so great that she required no assistance in replacing a man's dislocated shoulder. Of this strength she one day made a curious use. A fellow was sent to her by some doctors, who pretended that he had a dislocated wrist. She took hold of it, saw that it was all right, and with a single wrench turned his feigning into earnest. 'There!' she said. 'Go back to the fools who sent you, and get them to set your wrist; or if you come back this day month, I will do it for you myself.'

While still basking in the sunshine of fortune, this strong-minded, or at least strong-armed, practitioner determined to marry, the object of her choice being Hill Mapp, a footman in the employment of a mercer in Ludgate Hill. The marriage was not a fortunate one; Mr Mapp was not a good husband, nor did he give his connubial felicity a long trial, for he absconded in less than a week, taking with him, as a souvenir of his short honeymoon, a purse of a hundred guineas which his lady happened to have in the house. And in the December of the following year, her short hour of popular favour over, the once famous bone-setter died miserably poor at her lodgings in the Seven Dials, and, as Pat would say, was indebted to the parish for a coffin and a grave.

The Company of the Barber Surgeons of London was incorporated by Edward IV. in 1460-2, and one of the best of Holbein's pictures represents the presentation of a charter to this Company by Henry VIII.

Cheselden, John Hunter the anatomist, and many other distinguished names, are upon the roll of this Company. Among others is that of Sir Hans Sloane, an eminent physician, born in 1660, who bequeathed his museum to the public on condition that twenty thousand pounds should be paid to his family; this sum being something like the value of the gold and silver medals, ores, and precious stones which were comprised in his collection. Parliament accepted the trust; and in this manner the nucleus of the British Museum was formed.

Mr Timbs next treats of corpulence, many recipes for the cure of which are given. We read of a Spanish general, who by a free use of vinegar reduced his size so much that he could fold his skin around his body like a garment. How long he lived after he had effected this somewhat alarming reduction of bulk, is not recorded. If it is a wear-

iness to the flesh to be too fat, it is almost an equal affliction to be too lean. Larrey, a celebrated French surgeon, mentions an unfortunate priest who became so thin that he was at last unable to go through the celebration of mass. His bones and joints became so dry 'that at every genuflexion they cracked in such a loud and strange manner that the faithful were terrified, and the faithless laughed.' Mr Banting's struggle with corpulence is amusingly described; and as he won the battle, and became 'a thinner and a happier man,' those who think themselves too fat may, if they choose to run the risk, go and do likewise.

An interesting chapter treats about matters pertaining to the hair and beard. Many instances are recorded in which vivid mental emotions of a painful kind, such as extreme terror, have blanched the hair almost instantaneously. In prison the hair of Marie Antoinette became suddenly white; and Ludwig, king of Bavaria, who had caused his wife to be put to death, in a fit of jealous frenzy, on learning her innocence, suffered such extreme remorse that 'his hair became in a moment as white as snow.' Apropos of hair-dyes, there is an amusing anecdote of a lady who was beginning to get elderly, and who once said to Douglas Jerrold: 'I cannot imagine what makes my hair turn gray; I sometimes fancy it must be the essence of rosemary with which my maid is in the habit of brushing it. What do you think?' 'I should be rather afraid, madam,' replied the witty dramatist, 'that it must be the essence of time.'

Not much light is, or perhaps can be thrown upon the curious question of the origin of epidemics. The many theories which have been advanced upon this subject seem scarcely so much to touch the question as to leave it open and undetermined. Of what fatal combinations they are born we can scarcely tell; all that we can do is to turn them aside, if possible, in their destructive course, and combat and neutralise them, by improving as much as possible the sanitary conditions of life.

Many interesting anecdotes are given to illustrate the remarkable contagious power of typhus fever and the plague. Cotton shipped from a port infected with the plague is sometimes impregnated with such a poisonous effluvia, that instances have been known of people being struck down dead while opening the bales. The Arabs, who are fatalists, seldom resort to medicine for the cure of this disease; but in spite of their predestinarianism, they often try to escape from it by flying into the Desert; 'alleging as an excuse, that although the distemper is a messenger from Heaven sent to call them to a better world, yet, being conscious of their unworthiness, and that they do not merit this special mark of grace, they think it more advisable to decline it for the present.'

Poisons, of which Mr Timbs treats, have played a very important part in the history of the world. In the sixteenth and seventeenth centuries, and more particularly in the hands of Pope Alexander VI. and his infamous son, they were a regular engine of statecraft, and the powder and poisoned ring of the Borgias obtained an unenviable notoriety. Chemistry was then in its infancy, and such a dread of secret poisoning pervaded all classes of society, that there is no doubt that many guiltless persons must have fallen victims to the panic created by

the crimes of a few. Medicated gloves, bouquets, and handkerchiefs were sometimes used to convey the subtle agent of death, but more commonly it was introduced into the food or drink. Aqua Tofana, so named after the hag who invented it, was credited with the death of six hundred people in Rome, and was a preparation of arsenic; while the powder of succession, much in vogue with cardinals and personages still more exalted, was common sugar of lead. Laurel-water was the poison employed in a very remarkable case, that of Captain Donellan, in 1791. He was a needy, unprincipled, unscrupulous man; and his wife had a young brother, Sir Theodosius Boughton, to whose estates she was the nearest heir. This revisionary interest, it was alleged, combined with the captain's pecuniary difficulties, formed the motive for the crime which he conceived and carried out. His brother-in-law had some slight ailment, for which he received some phials of medicine from an apothecary, upon swallowing one of which he suddenly fell back in a fit, and died almost immediately, foaming at the mouth. It was afterwards proved that Captain Donellan had a still in which he prepared laurel-water, and that he shewed suspicious alacrity, after the death of Sir Theodosius, in rinsing out the phial which had contained the fatal draught. On this evidence he was condemned and hanged at Warwick, in spite of certain exculpatory medical evidence, which was led to the effect that a fatal fit might have been induced by the revulsion caused by swallowing a *nauseous medicine*.

Then comes an amusing anecdote of Sir Walter Scott's experience of the faculty, in a small English town where his servant fell sick, and he was under the necessity of sending for a doctor. There were two in the town, one who had been long established, and one a newcomer. The latter gentleman was fortunately found at home, and lost no time in obeying Sir Walter's summons, who, looking up when he entered, saw before him a grave, sagacious-looking man, attired in black, with a shovel-hat, in whom, to his utter astonishment, he recognised a Scottish blacksmith who had formerly practised with considerable success as a veterinary operator in the neighbourhood of Ashiestiel. 'How in all the world,' exclaimed Sir Walter, 'came you here? Can it be possible that this is John Laudie?'

'In truth it is, your honour—just a' that's for him.'

'Well, let us hear. You were a horse-doctor before; now it seems you are a man-doctor. How do you get on?'

'On? Just extraordinary weel; for your honour maun ken that my practice is vera sure and orthodox. I depend entirely upon two simples.'

'And what may their names be? Perhaps it is a secret?'

'I'll tell your honour' (in a low tone): 'my twa simples are just laudamy and calamy.'

'Simples, with a vengeance!' replied Sir Walter. 'But, John, do you never happen to kill any of your patients?'

'Kill? On, ay. May be sae. Whiles they dee and whiles no; but it's the will o' Providence. Ony-hoo, your honour, it *will be lang before it makes up for Flodden*.'

The use of anæsthetics, Mr Timbs tells us, was partially known to the ancients. Pliny states that

the juice of mandragora was used, before incisions were made into the body, to produce insensibility to pain; and the Chinese, in the third century of our era, were accustomed to administer a drug for the same purpose, supposed to be Indian hemp. During the middle ages, mandrake, a compound of mandrake and opium, and a potion composed of opium, mulberry, lettuce, and a variety of other herbs, was used to accomplish the same end; while in our own day, Sir James Simpson discovered in chloroform a safe, an effectual, and an easily administered anæsthetic agent, which has robbed the surgeon's knife of half its terrors, and conferred an inestimable boon upon sufferers of all ranks and ages.

Concerning sleep and its phenomena, there is much interesting information; and many curious instances of dreams are recorded, which, if not prophetic, at least produced upon the mind a strong impression of a coming event, which in a short time actually did take place. Dr Abercrombie, in his work on the Intellectual Powers, relates the following story of a dream, which, eight days before the assassination of Mr Perceval, Chancellor of the Exchequer, occurred three times in one night to a Cornish gentleman—Mr Williams of Scorrer House. The Chancellor was unknown to Mr Williams by sight, but in his dream he imagined that he (the dreamer) was standing in the lobby of the House of Commons, when a little man entered, dressed in a peculiar fashion. Almost immediately the little man was followed by another man, whose dress Mr Williams also particularly observed; and this second man drawing a pistol from under his coat, fired it at the first, who staggered and fell. A crowd of people then ran forward; Williams saw the murderer arrested, and heard, still in his dream, those around him say: 'Mr Perceval is dead.'

This dream, in itself unaccountable, is made stranger still by the fact that it occurred about much the same time, and in much the same form, to Bishop Baines!

Concerning insanity and the treatment of the insane, Mr Timbs shews us how much the deprivation of reason, the greatest calamity that can befall a rational being, has been intensified and prolonged in past times, by the ignorance and indifference of society. Over the gates of most lunatic asylums might have been written the inscription which Dante placed over his abode of the lost—'All hope abandon, ye who enter here.' In 1815 the House of Commons Committee found in the women's gallery in Old Bethlem, 'in a side-room, ten patients, each chained by one arm or leg to the wall, the chain allowing them merely to stand up by the bench or form fixed to the wall, or to sit down upon it.' The only article of clothing these poor women had, was a sort of blanket-gown made like a dressing-gown, but with no band to fasten it round the body. Their feet were bare, and while some of them were dirty, imbecile, and offensive, others spoke quite coherently, and were sensible and accomplished. The men were found, if possible, almost in a worse condition. 'Except the blanket-gown, they had no clothing, and the room had the appearance of a dog-kennel.' Private asylums were often still worse, the treatment of lunatics in Bethlem being considered to afford rather a favourable specimen of the best mode of curing the mentally afflicted!

The closing chapter treats of the phenomena of death. The diseases which conduce to dissolution are, as we all know, legion. There are many paths leading up to that grim gate; but when we pause at last before its portals, our passage to eternity is, according to the observation of the most competent authorities, painless. Mr Savory, a physician of great eminence, in commenting upon the subject, 'concurs in the statement of Sir Benjamin Brodie, that in almost all cases the point of death is free from physical suffering.'

The signs of death are various, but often in the partial delirium which supervenes, the mind returns to its habitual occupations, and in the very act of quitting the stage of life, constructs for itself a last imaginary act of the closing drama. 'Gentlemen of the jury,' said an expiring judge, Lord Tenterden, 'you will now consider your verdict.' 'It grows dark,' said Dr Adams, the author of *Roman Antiquities*, believing himself still surrounded by his pupils—'it grows dark; the boys may now dismiss.' '*Tête d'Armée*,' murmured the dying Napoleon, believing himself still charging at the head of his legions, instead of lying a helpless prisoner in his sea-girt dungeon of St Helena, slowly drifting, in spite of guards and jailer, into the freedom for which he had so vainly yearned.

FOLLOWING UP THE TRACK.

CHAPTER IV.

THE intervening few days had passed—they were days of suspense, when that condition of mind arises in which nothing can be done, through the very anxiety to be active and occupied, but the weary interval had at last been bridged over; and as the town clock of Clonmel was striking eight o'clock on the festival of Hallowe'en, the vigorous form of the tenant of the Glen farm could be seen in the dim obscurity, coming down the pathway and disappearing within the open doorway of the inn.

'The master bid me tell you to wait for him, should he be kept out late, for the mare he brought with him got lame on a sudden, when I took her out of the stable; and you are not on any account to go back until he sees you; and as he thought you might not like to be troubled with the company in the big room, you are to come into the one he keeps for the quality when they come here to give a treat to a herd or the like on a fair or market day.'

The speaker who thus accosted Maurice was a smart red-headed lad, rejoicing in the name of Clover, because his reputed mother had deserted the infant in a field of the same, probably speculating that as his habits and tastes had not yet been developed, he might possibly become a vegetarian, and take kindly to the only provender within his reach, in the absence of the alcohol which would have mingled so largely in the nutriment she would have supplied him with. An ill-natured world might possibly have suggested that her intentions were less philanthropical, and that provided she got rid of a burden, he might take care of himself in the best way he could. Be that as it may, the little waif cast upon the tide of life was picked up by a good-natured old woman—fed like

Romulus; a goat, however, being the substitute for the wolf; and after passing through various stages of misery after his benefactress had died, the outcast had arrived at the equivocal dignity of waiter at the *Traveller's Home*, in the absence of Brien Spelassy, who was the regular official of the establishment, but in the habit of so frequently going away, and returning at such irregular intervals, that the wonder was why Stephen Meagher, a hard and strict man, would submit to pay for services which were so frequently only nominal. The surmise, however, was that some unknown tie of kindred existed between them; and this belief was confirmed by the fact that Spelassy not merely neglected the duties of his employment, but would demand money of his employer with a roughness which denoted equality rather than the subservience of a subordinate. That mutual esteem was not the bond between them was evident, for sometimes, when a more than usually inordinate demand was made, the lips of the master would allow a few bitter words to escape; but they were quickly repressed.

'I dare not remain here long, even if your master does not soon come home,' was the reply of Maurice to the lad; 'no, not if you could make me a lord. My darling is waiting for me; and now that the country is in so bad a way, and the Whiteboys breaking into houses for arms, and doing even worse, and not even a gosssoon under my roof, I could not stay away from home, even if the sheriff was to "cant" all my goods the next blessed mornin'.'

'You know your own business best, I suppose,' was the rejoinder, and Clover smiled, as if he thought otherwise. 'But would your good woman at home thank you very much if you only came here on a fool's errand, and that after all the trouble my master went to on your account? Why, if Paddy Guilfoyle, who was hanged when the judge was last here, had only waited twenty-four hours longer, the letter from Amerieky, telling him of all the money left him by his brother, would have come, and he need not have gone and robbed the squire's house.'

'I think you mean to give me good advice; although I am not beholden to you for likening me to the man who died for his own bad act; and I will try and stop until your master comes back; but troubled as I am in my mind, I would rather be in any company than my own,' and as he spoke, the farmer, advancing a few steps, opened the door which at once introduced him into the tap-room. The occupants of it were not very select. Some were playing cards, the dirt of which followed suit with the hands that shuffled them, the prizes being a goose and a quart of poteen; and there was as much perverse ingenuity and scheming resorted to, as if a principality were involved in the ultimate issue. Others were too tipsy to score another vice to the catalogue of their offences; and then came those who with profitless profanity displayed their only knowledge of the things of another world by the use of sacred names cursed out with shocking frequency. These and many another vagrant dropped into the apartment by degrees; and coarse jest was followed by the noisy joyless laugh, the hard bitter word, the malignant scoff. The dreadful uniformity of selfishness in a scene meant for revelry, jarred upon the nerves as would a feast spread upon a tenanted collin; and Maurice

Power, unable to endure the company, after a while returned to the hall, and from thence into the room which had been reserved for him. A candle was brought in, a smoky fire kindled; but the latter did not lighten up the dingy decency of the place, and out stood in grim outline the propped-up drawers in the corner, the hard straight-backed chairs, and the seats, in which ravines of matted hair wound their tortuous course; while the faded carpet, patched and pieced, was like the primitive garment which antiquaries assert originated the tartan plaid.

The attendant evidently manifested considerable interest in the visitor. Could it have been because his honest presence exercised a humanising influence over the establishment? He quickly brought unbidden a steaming jug of punch, the chief ingredient in which was of too republican a spirit to submit to the imposition of any duty, or pay any tribute to His Majesty George III. The drink was pressed upon the stranger with an amount of solicitude almost amounting to rudeness; and in the abstraction of his mind he drank off the contents of the tumbler more than once. The hoarse asthmatic clock in the passage struck nine and ten successively, and its tickings beat with painful clearness on the nerves of the listener. An original thinker has declared that he could not endure the 'insolent monotony of the ocean when in repose,' but better monotony than the echoing utterances of time, and Maurice moodily drew close to the recently lighted fire-place, until at last his eyes began to close in unquiet sleep, and the white ashes of the turf seemed to form themselves into snow-drifts, while the charred pieces of bog-wood assumed the outlines of crushed and mutilated limbs.

How long he had been unconscious the dreamer knew not: vague figures had risen, as it were, and dilated until they filled the apartment, and made the air difficult to breathe; and he awoke with the sensation that the ceiling was crushing down upon him, that the walls were pressing round him with iron grasp, and that many waters were hurtling and beating against the closed door. All was profound darkness; not the 'palpable obscure' of the poet, but something as it were far in excess of it; and the brain of the sufferer reeled and wandered, not under the agency of mere drink, but as if opium had been swallowed by one who had never before experienced the clouded intellect that is attendant on its use. Where was he? Was that the mountain stream near his cottage which was sounding in his ears? Was that the fervent breathings of the wind in the grove below? Or was it the tramp of armed men, pacing up and down the bazaar or passage leading to his own loved home? Or—terrible thought!—could it be possible, as each broken image passed across his brain, that the whole was a delusion, and that he had become a madman? He groped his way along the wall, felt the barred window which the heavy curtains concealed from observation, caught the handle of the door, and was out into the passage opposite the tap-room. The street entrance was at the far end; but when he reached it, there was a heavy padlock on its hasp, and the echoes of his own footsteps, as he trod upon the creaking boards, alone broke the profound silence. Not a gleam of light could be observed; and the sense of touch was but of little

avail in the labyrinth of the building in which he found himself. A heavy grating at the foot of the stairs prevented access to the landing above; and two massive bolts shot into recesses in the wall, and secured there, indicated that the usurer had adopted precautions to prevent customers, when the business of the evening was finished, making their way over the house.

What was to be done? He had evidently been forgotten. The first and natural impulse was to try and alarm the inmates. He listened for a short time; but except the movements of the clock and the beating of his own heart, all was as silent as the grave. Ah! what would his wife think of his absence? What terrors might she be enduring at that moment! for never since his marriage had he slept under any roof but his own; and there was vividly present to his recollection, as death was clouding the eyes of the mother of his bride Ellen, the last joyous gleam passing over the wan countenance, when he assured her that he would be everything to her child. As this thought arose, all about the necessity of the loan about which he came and had delayed so long was forgotten, and with a sudden effort he forced the door and quitted the house.

The night was wet and profoundly dark; the wind sighed and fretted itself, dashing against the chinks and recesses of the maze of humble dwellings into whose company it had been seduced, away from the pure mountain range encircling the town; but on and on sped the husband, as if he could relieve the agitation of his soul by rapid motion. On, on through the dim streets, past the open market square with its quaint stiff-necked roofing. On by the quays, which in the daytime used to be animated with the shouts of the boatmen as they drew their barges across the gravel in the shallow water, laden with piled sacks of corn and other produce, the wine and oil of the rich surrounding plains and valleys of the Golden Vale. The long bridge spanning over the Suir was passed over, and up and up the hilly road and past several scattered cabins Maurice Power urged his way, at one time rushing along with wild impetuosity, and then pausing to recover his breath. How he envied the inmates of each, buried in sleep after the labours of the past day! They had no care now, whatever the morning might bring forth. A just Providence deals not so unequally with the poor, and wealth has cares that attend not the human lilies of the field, whom the autocrats of the Stock Exchange would despise. For them a greater than Solomon provides; and in their resignation and calm endurance under trials, Christian virtues and graces are revealed before which the sufferings of martyrs sink into insignificance; the one being a life-long submission in obscurity, and the other the temporary agony which the glory of their subsequent fame and example enables them to sustain.

It was not until the glen had been reached and the entrance to the bazaar, that Maurice, panting and exhausted, leaned against the ditch to rest himself for a few minutes. Then, with a quieter and more composed step, he proceeded up the passage, and opening the gate of the farm-yard, said, by way of precaution, not to cause any sudden alarm, and in a low tone of voice: 'Down, Rover; down, good dog. Poor fellow, sure it's only myself has come home; don't bark, Rover.' But there came

no yelp of recognition ; no significant greeting by the fierce but faithful mastiff.

Was there any light in the dwelling-house ? None. Ellen had doubtless been tired of watching for her husband, and had fallen asleep. But what was that seemed to flit across, and could he possibly have been mistaken in his first glance ? Yes ; he must have been, for in the bedroom which was at the end of the cottage, and through the chinks of the shutters which secured the window, a thin thread of brightness flickered amid the darkness, and a faint murmur of voices came out upon the night-air. Maurice Power approached silently to the spot ; his straining eyes were fixed upon the little opening, which afforded but a very limited view of the interior. Vague undefined outlines could be traced, but nothing palpable ; and rising from a stooping posture, to obtain a better means of observation, the heavy staff which he grasped struck against a projecting stone in the wall, and made a sound in so doing, low but yet distinct. Big drops poured down his forehead ; his heart beat with the painful clearness which often heralds the stoppage of its action for ever ; and it was only after an interval that he stood erect and placed his face close to the aperture. All seemed quiet. Had his fears been awakened without a cause ? Was he the victim of a too sensitive imagination ? No ; he felt convinced that cautious steps were moving within ; and in a few seconds the door opened, and the indistinct figure of a man crossed the threshold into the yard, two others following. They went towards the window in the direction whence the noise proceeded. Immediately beyond it and at the gable there was a small railed inclosure, meant by Ellen Power, in the first days of her married life, for a tiny pleasure-ground, in which Chinese roses, woodbine, and clematis might twine their tendrils up to the thatch, and afford a shelter as well as a source of ornament ; but domestic cares soon came in the way, and the protecting paling had fallen into a state of decay—was tumbled down, or rubbed against by cattle and pigs, and made the asylum for proscribed donkeys and intrusive fowls.

The foremost of the persons who had come out from the cottage approached so close to Maurice Power that the latter almost fancied he felt the chill air getting warmer within the little circle of his breath ; and the next move of the unknown intruder's foot would have met his, had it not been that he crouched down, and drawing back to the broken paling, crossed it, over into the yard, where some strewn hay dulled every sound. In an instant afterwards was heard a hoarse voice muttering : 'It must have been fancy made us think we heard something outside.'

'No !' was the response of a second speaker ; and the peculiar intonation had, as it were, a potent influence upon the agitated listener. 'I could swear I heard something strike against the wall.'

'Faith,' whispered a third person, and the tension of his faculties was such that the husband could accurately distinguish every inflexion of tone, and assign each to its appropriate utterer, 'an uneasy conscience is a bad companion ; and sorry I am I was ever got to join you in this business, even though I never thought it would come to the pass it has done ; and if I had as much to own as either of you'—Here he seemed as

if he were about to mention the names of his companions ; but the words were stopped by the significant : 'Not a word out of you, as you value your life. Trust none, living or dead, with our secrets. Let us leave the place as quickly as we can, when our business is done ; for *he*'—and marked emphasis was laid on the phrase—'might be back again before the morning breaks.'

THE USE OF FORESTS.

FORESTS have uses in nature not usually thought of. They furnish wood—that we all know. They shelter the lands against piercing winds. They are generally beautiful to the eye—at least a relief to bareness. But that is not all. They modify, or rather avert, destructive torrents of rain. The evil effects of the wholesale cutting down of extensive tracts of timber are, it may be said, only beginning to be felt. Direful results have ensued, and now it is to be hoped we are taking warning. While extensive forest-clearings have been made, reckless of consequences, in India, the United States, and other portions of the globe, France was the first country to awake to the folly of the system. The old seigneurs loved woods, the peasant-farmer hates them. In the south, where the land has been more cut up into small properties than in other parts, the trees have been so cleared off that there are whole communes without any ; mountain communes, which, owing to the now unchecked action of the rains, bid fair to be pretty soon nothing but bare rock. The peasant grubbs up a tree, and thereby gets a few more square yards for his rye or lucern ; but thereby also he helps to keep off the gentle rains, and to bring about destructive droughts, alternating with no less destructive floods. That, at anyrate, was the conclusion to which years of study and observation led M. Becquerel, who, a quarter of a century ago, published his book on the Effects of Forests on Climate. He and his fellow-workers cried out so loudly, that people got fairly frightened. In France, replanting began at a great rate, though, unhappily, not to any extent in the poorest communes of the south, where it is most needed. Latterly, in the United States, laws have been made against the reckless destruction of forests ; and in India a whole 'service' has been formed to manage the forests, taking care that they are cut judiciously, and that new plantations are always made after a clearance, so that furnaces may be well kept in provender without any risk of entirely stripping the country of its timber.

The Third Napoleon at first advocated the use of trees : part of the Gascon *landes* towards Arcachon was planted with firs ; a good deal of the Sologne—a hungry sort of Bagshot Heath, in Central France—was treated in the same way. But by-and-by, as we all know, 'playing Providence' became very expensive ; the revenue always shewed a deficit, and expedients of all kinds were resorted to, to 'raise the wind,' without

increasing taxation. 'Why not sell the crown forests?' asked Fould, the imperial financier. 'Because,' replied his master, 'if we do, the buyers will cut most of them down; and then, what are we to do for wood?' 'Burn coal,' replied the Israelite; 'having a long bill with England will strengthen the *entente cordiale*.' And he straightway set one of the many venal *savants* of 'the Second Empire' to write a book, in which it was 'proved' that forests had no appreciable effect upon climate. The *savant* had some conscience; he was forced to confess that cutting down the trees did cause that *ravinement*—sweeping away of earth and seaming hill-sides with channels, from which (as we have already noticed) many communes in the south of France, and not there only, have suffered; but he stoutly denied that forests have any effect in increasing or regulating the rainfall. This was in 1865; and since then, M. Mathieu, Director of the School of Forestry at Nancy; M. Cantégaill, Inspector of Forests at Carcassonne, and others, have been conducting a series of conclusive experiments. Fortunately, public opinion was too strong even for M. Fould; and after the Reports published within the last three years, it is not likely that the attempt will be made again.

Forests, it seems, have a fourfold effect on climate and rainfall. There is the chemical action of their leaves, which decompose the carbonic acid of the air, fixing the carbon in their woody tissue, and liberating the oxygen. There is their physical action, in hindering evaporation and stopping currents of air, and in covering the ground with a vegetable mould which holds water like a sponge. And there is the organic action of the leaves, which, in breathing, restore to the air a part of the water which the roots have drained from the soil. Lastly, there is the mechanical action of the roots, which at once prevent the earth from being washed away by rain, and also enable the water to filter down deep into the ground. Forests, then, ought to make a country cooler, by withdrawing the carbon from the air; the heat that is set free when wood is burned is the very heat that was being absorbed while it was growing. A forest may be looked on as a vast condensing apparatus for storing up the heat of the atmosphere. That is what theory says, and experiment confirms it. The mean temperature of a wooded country is always lower than that of a similarly situated treeless country; but (and this is important) the cold is less extreme, as well as the heat, and changes of temperature are gradual. Of course, since rain comes because the air is too cool to hold its moisture any longer in solution, there ought to be more rain in a wooded than in a treeless district; and so there is—from six to eight per cent., as M. Faurat found by putting up several rain-gauges, some in a forest, seven yards above the tree-tops, others on treeless ground some two hundred yards off. Bare soil soon gets heated, and heats the surrounding air. This expands, rises, and absorbs, without condensing them, the vapours brought by the sea-winds. Rain only comes in such a district when a contrary wind meets this hot current, packs its layers one on another, and, as it were, squeezes out

the wet from them. Hence such rain, due to 'atmospheric perturbation,' generally comes in floods, unlike the gentle natural rainfall of forest-land. Storms are rare in wooded countries, the electricity of the air being gradually drawn off instead of accumulating. Hail especially is rare where there are many trees. M. Cantégaill has tracked many of the hailstorms so destructive in France, and has found that they generally make a leap over a forest. Early in June 1874, for instance, a hailstorm which had swept over the department of Ariège, entered that of Aude. As soon as it got to the forest-land, the hail totally ceased; but when it reached the treeless department of the Eastern Pyrenees, it began again with great fury; yet there was electricity enough in the air over the forests, for several fir-trees were struck and shivered to pieces. But hail is caused by the very rapid evaporation of rain passing through an exceedingly dry stratum of air. Evaporation, we know, always causes cold (this is the principle of water-coolers, &c.); and in this case the latent heat of the rain is withdrawn so rapidly that the result is frozen raindrops. Hence, in wooded countries, where the air is always moist, the evaporation is slower, and rain falls instead of hail.

Every one must have felt the soft warmth of the air in a wood just after nightfall, so different from the chill that comes on after a hot dry day in an open plain. No wonder—evaporation and radiation of heat are five times greater in the latter than in the former. But, it may be said, if the trees bring more rain, they use up more than the treeless ground, for their roots drain the soil, and their leaves drain the atmosphere. Not so; though wood is more than half water, the amount of water contained in all the wood in a forest is the veriest trifle compared with the rain that falls on it during the year. Moreover, a series of experiments seems to shew that the amount of water decomposed by an acre of forest is very much less than that required by an acre of cabbage, or wheat, or clover. Again, because pines and other trees (notably the blue-gum, *Eucalyptus globulus*, which is being planted by the million in Algeria) dry up marshes, it has been argued that trees must lessen the water-supply. But here again experiment comes in, and proves that this drying-up is not due to evaporation through the leaves, or to the water being in any other way sucked up by the trees. All the trees that have this property can, and do, thrive also in dry hungry soils; they drain the soil by virtue of their spreading roots, which enable the water to run off into the lower strata.

Hence, it seems clear that forests lower the temperature, while they prevent extremes, and increase the rainfall, at the same time that they regulate it, and keep off those deluges of rain which cause sudden and destructive floods. Floods do come in wooded countries; but they are not floods like those of the Loire, which, rising in bare granitic mountains, brings down, when it overflows, a mass of sand and shingle which ruins some of the best land in France. During the terrible rains of September 1860, careful observations were made in Savoy and Auvergne, and it was seen that wherever there were woods, or even quite recent plantations, made terrace-wise along the hill-sides, so as to cut across the torrents and force them into a zigzag, the rains did little harm; where the

mountain sides were bare, the roads and bridges were swept away, and the valleys covered with shingle. At last, the peasantry have seen the force of this; and out of some two hundred thousand acres replanted from 1860 to 1868, four-fifths have been done by private individuals or by the *communes*. In this way, Einbrun, at the mouth of the valley of Sainte-Marthe, in the High Alps, has been saved. The work was begun in 1865, by raising two hundred little dikes in the torrent-bed. These were planted with quick-growing trees and shrubs, whose roots so consolidated the earth, that now there is practically no torrent at all. After heavy rains, the water, of course, rises; but it no longer whirls down sand and shingle, and huge masses of rock with it.

These, then, are the two great uses of forests—to increase the rainfall, and to prevent it from coming in devastating floods, instead of in fertile showers. The first is most valuable in hot countries. It is sad to think what mischief has been wrought in the fairest countries of the world by reckless destruction of forests. Persia, the whole Indus valley, the valley of the Euphrates; and, above all, Lesser Asia, have each of them suffered grievously from this waste. Lesser Asia, the Greeks looked on as the garden of the world; it is now subject to droughts like that which not long ago spread death through whole provinces. The same everywhere. The millions of mulberry trees planted in Egypt since Mehemet Ali's time have actually brought rain to that hitherto rainless land; the plantations here and there along the Suez Canal are doing the same.

The other effect of forests tells everywhere. In the forest of Montant, in the department of the Aude, a stream used to turn a whole string of fulling-mills. The land was disforested, and the trees were wholly cut down. At once the supply of water became so irregular, that the mills were stopped during a considerable part of the year. The *commune* has lately replanted its forest; and now the stream runs all the year round, and the mills go on as merrily as of old. In the neighbouring 'Black Mountain,' observations have been made in two valleys, one wooded, the other treeless. After rain, there is much less water from the first; but then it lasts much longer—does not all run away in a flood, as it does from the other. The reason why on our maps of Palestine nearly every river is marked with dotted lines as 'a winter torrent,' is because the country has been almost bared of timber. We shall never be able to get rid of floods; but forests undoubtedly lessen their violence, by letting the water down gradually.

No doubt, one may have too much of a good thing. Gaul, in Cæsar's time, was far colder than it is now, because both it and Germany were to a great extent one vast forest. The Rhine in those days used to be regularly frozen hard enough for troops to march across. Italy was colder than it is now, from the same cause; so was England. West Africa and parts of tropical America are pestilential, because the soil is so saturated, owing to the thick forests, and consequently small evaporation, that it can hold no more, and the rains cause marshes, which last from one rainy season to the next. Too many trees are, in this case, nearly as bad as none at all; it is a choice between the Sahara and the Gold Coast. But even in such places trees should be cut down with judgment,

and should be replaced by the fever-preventing *Eucalyptus*; while in India and in Ceylon, the coffee-planter and the man who cuts railway fuel need to be narrowly watched; and in New Zealand and Australia, the recklessness of the emigrant wants checking. It is so easy to make a place treeless, so difficult to reclothe it again. The French are finding this out; and we in England and Scotland, and still more in Ireland, might, in spite of all that has been done, take a leaf out of their book. The wholesale destruction of fine old trees round London is not atoned for by a little planting on the Thames Embankment. Trees are living things, working for the good of the common weal; and if we recklessly destroy them, we lessen the sum of national life, and therefore the amount of national power.

REMEMBERED DAYS.

I REMEMBER a morn behind the mill,
When blackbirds sang,
And sheep-bells rang,
Far off, and all things else were still,
But the rising bream
In the pictured stream,
And the noise of water about the mill.

I remember a maid in her sweet youth,
Whose gentle days
In village ways
Were passed in simple works of truth;
The Summer's day
Sped fast away
In a dream of love, in a time of youth.

I remember the Spring in garb of green,
The light heart glee
That came to me
With the smile of my love at seventeen;
Her laugh that went
Like woodland scent
To my soul—that time on the daisied green.

And though I know the days are spent,
That love was lost
When came the frost
At summer's close of my content;
Yet some joy stays
In winter days,
And brings its joyous complement.

The Conductors of CHAMBERS'S JOURNAL beg to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.

2d. To insure the return of papers that may prove ineligible, postage-stamps should in every case accompany them.

3d. All MSS. should bear the author's full CHRISTIAN name, surname, and address, legibly written.

4th. MS. should be written on one side of the leaf only.

5th. Poetical offerings should be accompanied by an envelope, stamped and directed.

Unless Contributors comply with the above rules, the Editor cannot undertake to return ineligible papers.

MY STARLING.

I FEEL very lonely now since my starling is gone. I could not bear to look upon his empty cage, his bath and playthings, so I have had them all stowed away; but the bird will dwell in my memory for many a day. The way in which that starling managed to insinuate itself into my heart and entwine its affections with mine, I can never rightly tell; and it is only now when it is gone that I really know how much it is possible for a human being to love a little bird. The creature was nearly always with me, talking to me, whistling to me, or even doing mischief in a small way, to amuse me; and it was often the very best relaxation I could have had, to throw down my pen, straighten my back, and have a romp with Dick.

The rearing of a nest of starlings is always a very difficult task, and I found it peculiarly so. In fact one young starling would require half-a-dozen servants at least to attend it. I was not master of those starlings, not a bit of it; they were masters of me. I had to get out of bed and stuff them with grub at three o'clock every morning. They lived in a band-box in a closet off my bedroom. I had to get up again at four o'clock to feed them, again at five, and again at six; in fact I saw more sunrises during the infancy of that nest of starlings than ever I did before or since. By day, and all day long, I stuffed them, and at intervals the servant relieved me of that duty. In fact it was pretty nearly all stuffing; but even then they were not satisfied, and made several ineffectual attempts to swallow my finger as well. At length—and how happy I felt!—they could both feed themselves and fly. This last accomplishment was anything but agreeable to me, for no sooner did I open their door than out they would all fly, one after the other, and seat themselves on my head and shoulders, each one trying to make more noise than all the rest and outdo his brothers.

I got so tired of this sort of thing at last, that one day I determined to set them all at liberty. I accordingly hung their cage outside the window

and opened their door, and they all flew, but back they came into the room again, and settled on me as usual. 'Then,' said I, 'I'm going gardening.' By the way they clung to me it was evident their answer was: 'And so are we.' And so they did. And as soon as I commenced operations with the spade, they commenced operations too, by searching for and eating every worm I turned up, evidently thinking I was merely working for their benefit and pleasure. I got tired of this. 'O bother you all!' I cried; 'I'm sick of you!' I threw down my spade in disgust; and before they could divine my intention, I had leaped the fence and disappeared in the plantation beyond.

'Now,' said I to myself as I entered the garden that evening after my return, and could see no signs of starlings, 'I'm rid of you plagues at last;' and I smiled with satisfaction. It was short-lived, for just at that moment, 'Skraigh, skraigh, skraigh' sounded from the trees adjoining; and before I could turn foot, my tormentors, seemingly mad with joy, were all sitting on me as usual. Two of them died about a week after this; and the others, being cock and hen, I resolved to keep.

Both Dick and his wife soon grew to be very fine birds. I procured them a large roomy cage, with plenty of sand and a layer of straw in the bottom of it, a dish or two, a bath, a drinking fountain, and always a supply of fresh green weeds on the roof of their domicile. Besides their usual food of soaked bread, &c. they had slugs occasionally, and flies and earthworms. Once a day the cage door was thrown open, and out they both would fly with joyful skraigh, to enjoy the luxury of a bath on the kitchen floor. One would have imagined that being only two, they would not have stood on the order of their going; but they did, at least Dick did, for he insisted upon using the bath first, and his wife had to wait patiently until his lordship had finished. This was part of Dick's domestic discipline. When they were both thoroughly wet and draggled, and everything within a radius of two yards was in the same condition, their next move was to hop on to the fender, and flutter and gaze pensively into the

fire; and two more melancholy looking, ragged wretches you never saw. When they began to dry, then they began to dress; and in a few minutes Richard was himself again, and so was his wife.

Starlings have their own natural song, and a strange noise they make too. Their great faculty, however, is the gift of imitation, which they have in a wonderful degree of perfection. The first thing that Dick learned to imitate was the rumbling of carts and carriages on the street, and very proud he was of the accomplishment. Then he learned to pronounce his own name, with the prefix 'Pretty,' which he never omitted, and to which he was justly entitled. Except when sitting on their perch singing or piping, these two little pets were never tired engineering about their cage, and everything was minutely examined. They were perfect adepts at boring holes; by inserting the bill closed, and opening it like a pair of scissors, lo! the thing was done. Dick's rule of conduct was that he himself should have the first of everything, and be allowed to examine first into everything, to have the highest perch and all the tit-bits; in a word to rule, king and priest, in his own cage. I don't suppose he hated his wife, but he kept her in a state of inglorious subjection to his royal will and pleasure. 'Hezekiah' was the name he gave his wife; I don't know why, but I am sure no one taught him this, for he first used the name himself, and then it was only to correct his pronunciation.

Sometimes Dick would sit himself down to sing a song; and presently his wife would join in with a few simple notes of melody; upon which Dick would stop singing instantly, and look round at her with indignation. 'Hezekiah! Hezekiah!!' he would say; which being interpreted, clearly meant: 'Hezekiah, my dear, how can you so far forget yourself as to presume to interrupt your lord and master with that cracked and quavering voice of yours!' Then he would commence anew; and Hezekiah being so good-natured, would soon forget her scolding and again join in. This was too much for Dick's temper; and Hezekiah was accordingly chased round and round the cage and soundly thrashed. His conduct altogether as a husband, I am sorry to say, was very far from satisfactory. I have said he always retained the highest perch for himself; but sometimes he would turn one eye downwards, and seeing Hezekiah sitting so cosily and contentedly on her humble perch, would at once conclude that her seat was more comfortable than his; so down he would hop and send her off at once.

It was Dick's orders that Hezekiah should only eat at meal-times; that meant at all times when he chose to feed, *after he was done*. But I suppose his poor wife was often a little hungry in the interim, for she would watch till she got Dick fairly into the middle of a song, and quite oblivious of surrounding circumstances, then she would hop down and snatch a meal on the sly. But dire was

the punishment for the deceit if Dick found her out. Sometimes I think she used to long for a little love and affection, and at such times she would jump up on the perch beside her husband, and with a fond cry sidle close to him.

'Hezekiah! Hezekiah!' he would exclaim; and if she didn't take that hint, she was soon knocked to the bottom of the cage. In fact Dick was a domestic tyrant, but in all other respects a dear affectionate little pet.

One morning Dick got out of his cage by undoing the fastening, and flew through the open window, determined to see what the world was like, leaving Hezekiah to mourn. It was before five on a summer's morning that he escaped; and I saw no more of him until, coming out of church that day, the people were greatly astonished to see a bird fly down from the steeple and alight upon my shoulder. He retained his perch all the way home. He got so well up to opening the fastening of his cage-door that I had to get a small spring padlock, which defied him, although he studied it for months, and finally gave it up, as being one of those things which no fellow could understand.

Dick soon began to talk, and before long had quite a large vocabulary of words, which he was never tired using. As he grew very tame, he was allowed to live either out of his cage or in it all day long as he pleased. Often he would be out in the garden all alone for hours together, running about catching flies, or sitting up in a tree repeating his lessons to himself, both verbal and musical. The cat and her kittens were his especial favourites, although he used to play with the dogs as well, and often go to sleep on their backs. He took his lessons with great regularity, was an arduous student, and soon learned to pipe *Duncan Gray* and *The Sprig of Shillelagh* without a single wrong note. I used to whistle these tunes over to him, and it was quite amusing to mark his air of rapt attention as he crouched down to listen. When I had finished, he did not at once begin to try the tune himself, but sat quiet and still for some time, evidently thinking it over in his own mind. In piping it, if he forgot a part of the air, he would cry: 'Doctor, doctor!' and repeat the last note once or twice, as much as to say: 'What comes after that?' and I would finish the tune for him.

'Tse! tse! tse!' was a favourite exclamation of his, indicative of surprise. When I played a tune on the fiddle to him, he would crouch down with breathless attention. Sometimes when he saw me take up the fiddle, he would go at once and peck at Hezekiah. I don't know why he did so, unless to secure her keeping quiet. As soon as I had finished he would say 'Bravo!' with three distinct intonations of the word, thus: 'Brävo! doctor; br-r-ravo! brävo!'

Dick was extremely inquisitive and must see into everything. He used to annoy the cat very much by opening out her toes, or even her nostrils, to

examine; and at times pussy used to lose patience, and pat him on the back.

'Eh?' he would say. 'What is it? You rascal!' If two people were talking together underneath his cage, he would cock his head, lengthen his neck, and looking down quizzingly, say: 'Eh? *What* is it? *What* do you say?'

He frequently began a sentence with the verb 'Is,' putting great emphasis on it. 'Is?' he would say musingly.

'Is what, Dick?' I would ask.

'Is' he would repeat—'Is the darling starling a pretty pet?'

'No question about it,' I would answer.

He certainly made the best of his vocabulary, for he trotted out all his nouns and all his adjectives time about in pairs, and formed a hundred curious combinations.

'Is,' he asked one day, 'the darling doctor a rascal?'

'Just as you think,' I replied.

'Tse! tse! tse! Whew! whew! whew!' said Dick; and finished off with *Duncan Gray* and the first half of the *Sprig of Shillelah*.

'Love is the soul of a nate Irish-man,' he had been taught to say; but it was as frequently, 'Love is the soul of a nate Irish starling;' or, 'Is love the soul of a darling pretty Dick?' and so on.

One curious thing is worth noting: he never pronounced my dog's name—Theodore Nero—once while awake; but he often startled us at night by calling the dog in clear ringing tones—talking in his sleep. He used to be chattering and singing without intermission all day long; and if ever he was silent then I knew he was doing mischief; and if I went quietly into the kitchen, I was sure to find him either tracing patterns on a bar of soap, or examining and tearing to pieces a parcel of newly arrived groceries. He was very fond of wine and spirits, but knew when he had enough. He was not permitted to come into the parlour without his cage; but sometimes at dinner, if the door were left ajar, he would silently enter like a little thief; when once fairly in, he would fly on to the table, scream, and defy me. He was very fond of a pretty child that used to come to see me. If Matty was lying on the sofa reading, Dick would come and sing on her head; then he would go through all the motions of washing and bathing on Matty's bonnie hair; which was, I thought, paying her a very pretty compliment.

When the sun shone in at my study window, I used to hang Dick's cage there, as a treat to him. Dick would remain quiet for perhaps twenty minutes, then the stillness would feel irksome to him, and presently he would stretch his head down towards me in a confidential sort of way, and begin to pester me with his silly questions.

'Doctor,' he would commence, 'is it, is it a nate Irish pet?'

'Silence, and go asleep,' I would make answer.

'I want to write.'

'Eh?' he would say. 'What is it? What d'ye say?'

Then, if I didn't answer:

'Is it sugar—snails—sugar, snails, and brandy?'

Then: 'Doctor, doctor!'

'Well, Dickie, what is it now?' I would answer. 'Doctor—whew.' That meant I was to whistle to him.

'Shan't,' I would say sulkily.

'Tse! tse! tse!' Dickie would say, and continue: 'Doctor, will you go a-clinking?' I never could resist that. (Going a-clinking meant going fly-hawking. Dick always called a fly a clink; and this invitation I would receive a dozen times a day, and seldom refused. I would open the cage-door, and Dick would perch himself on my finger, and I would carry him round the room, holding him up to the flies on the picture-frames. And he never missed one.)

Once Dick fell into a bucket of water, and called lustily for the 'doctor'; and I was only just in time to save him from a watery grave. When I got him out, he did not speak a word until he had gone to the fire and opened his wings and feathers out to dry, then he said: 'Bravo! Bravo! Bravo!' several times, and went forthwith and attacked Hezekiah.

Dick had a little travelling cage, for he often had to go with me by train; and no sooner did the train start than Dick used to commence to talk and whistle, very much to the astonishment of the passengers, for the bird was up in the umbrella rack. Everybody was at once made aware of both my profession and character, for the jolting of the carriage not pleasing him, he used always to prelude his performance with: 'Doctor, doctor, you r-r-rascal. What is it, eh?' As Dick got older, I am sorry, as his biographer, to be compelled to say he grew more and more unkind to his wife—attacked her regularly every morning and the last thing at night, and half-starved her besides. Poor Hezekiah! She could do nothing in the world to please him. Sometimes, now, she used to peck him back again; she was driven to it. I was sorry for Hezekiah, and determined to play pretty Dick a little trick. So one day, when he had been bullying her worse than ever, I took Hezekiah out of the cage, and fastened a small pin to her bill, so as to protrude just a very little way, and returned her. Dick walked up to her at once. 'What,' he wanted to know, 'did she mean by going on shore without leave?' Hezekiah didn't answer, and accordingly received a dig in the back, then another, then a third; and then Hezekiah turned and let him have one sharp attack. It was very amusing to see how Dick jumped, and his look of astonishment as he said: 'Eh? What d'ye say? Hezekiah! Hezekiah!'

Hezekiah followed up her advantage. It was quite a new sensation for her to have the upper hand, and so she courageously chased him round and round the cage, until I opened the door and let Dick out.

But Hezekiah could not live always with a pin tied to her bill; so, for peace-sake, I gave her away to a friend, and Dick was left alone in his glory.

Poor Dickie! One day he was shelling pease to himself in the garden, when some boys startled him, and he flew away. I suppose he lost himself, and couldn't find his way back. At all events I only saw him once again. I was going down through an avenue of trees about a mile from the house, when a voice above in a tree hailed me: 'Doctor! doctor! What is it?' That was Dick; but a crow flew past and scared him again, and away he flew—for ever.

Dear little fellow! he may well have asked 'What is it?' for all things must have appeared very new and strange to him.

Is it any wonder I miss my dear little bird?

FRENCH CAVE-MEN.

THE skeletons, weapons, and ornaments of the cave-men who form the subject of this paper, were discovered, as we shall presently shew, for the most part in two distinct regions of Southern France, the excavations which brought them to light having been undertaken, under government patronage, by zealous French antiquaries.

In the Museum of Toulouse may be seen the skull of a man who dwelt ages ago in a cave at Langerie Basse, in the French department of the Dordogne. When he lived we can only guess, it was so very, very long ago. But in his day there was no village of Lower Langerie, no department of the Dordogne, no France, republican or imperial, no Gaul even—nothing but a nameless, frigid land of lagoon, forest, swamp, and glacier, ranged by wild beasts and wild men. Long ages before Troy was besieged or Jerusalem built, this savage hunter drank of the water of the little river Vézère, which still tinkles past the cavern on its passage to the blue, sunny Bay of Biscay that dimples and flashes hard by.

He died in his sleep, and by an accident to which these savage masters of Europe seem to have been very liable. As he lay, a limestone block from the roof of the cave fell upon his neck and chest, leaving the head uninjured. A well-shaped, largely developed head it was, more like, so craniologists declare, to a Grecian skull than to that of a Carib or a Mongol, the head of one who could appreciate beauty, and was not devoid of the artistic instinct. He was indeed not merely a mighty hunter, used to grapple with brutes more terrible than our continent can now shew, but a draughtsman of no mean pretensions, as we shall presently see.

The great cave near Langerie Basse, behind the picturesque Gorge d'Enfer, and called the Moustier from some fancied resemblance to a medieval minster or church, was known to be rich in animal remains. Bones and teeth once belonging to the monstrous cave-bear, the long-haired cave-lion, the great tiger, in comparison with which the fiercest denizen of the Bengal jungle is but a puny thing, and of the hyena, were dragged to light, along with the bones of horse and ox, stag and reindeer, the bison of the north and the ibex of the hills. Quite recently, and after hard work with pick, shovel, and gunpowder, the way was cleared to the spot where lay the buried man of the cave himself.

He had lain down to rest, no doubt, after the fashion of all barbarians, fully dressed, but time has rotted away every scrap of the bear's fur and deerskin that clothed him. His ornaments have proved more durable, for his broad collar and bracelets lay in fragments around him when the searchers reached his rocky couch. These were entirely composed of perforated sea-shells of two varieties of the genus *Cyprea*, only found in the Mediterranean, and quite unknown in that stormy Atlantic which foamed and rolled within a league or so of the wild man's grave. Here was a fact, then, resting on indisputable evidence;

either by commerce or by migration the hunters of Western Gaul could procure the products of the far-off Southern Sea.

These shells, faded with age and damp, had once been of a rare lustre and beauty. Each was somewhat larger than a pigeon's egg, transparent as porcelain, and while half of them were of a silvery mouse-gray, the rest were of a light red colour, so that the contrasted hues must have produced an effect which modern jewellers would not despise. At some paces off, amidst the rubbish which littered the uneven floor, were picked up, first the sketch of a horse's head, scratched with flint or bone, on the horn of a buck, then similar sketches of a wild cat, of the antlered head of a stag, and of a hare. Lastly was found, executed with the rudest tools, no doubt, and on part of the horn of a reindeer, a really admirable engraving which represents a fawn in the act of running. A similar sketch on mammoth ivory, and representing a mammoth, had been found in a cave, eight years earlier, in Auvergne.

The great preponderance of reindeer bones in the Moustier proved that these animals, now confined to Scandinavia and Lapland, were the chief game pursued by the nomadic people who dwelt in caves, while the ornaments of subtropic shells suggest a wintery migration southwards, to escape the severe frosts which must have been general in Gaul, a country which could at best have presented but a softened prototype of the Greenland of to-day.

The grotto of Lortet in the High Pyrenees, long blocked by stalactites above and stalagmites below, yielded, when explored, along with many bones and many weapons of flint and bone, one spirited engraving on stag's horn representing a moor-fowl, but no human remains. The other bones were those of bear, reindeer, moor-fowl, stag, and horse, those of the horse being by far more abundant than those of the deer. All the bones, like those found in the glacial mud of Alsace, in the Swiss cave of the Kesslerloch, or in the Belgian Trou du Frontal, had been split from end to end for the sake of extracting the marrow.

There was some dispute, not as to nationality, but as to national ownership, with regard to the superb skeleton which persevering M. Emile Rivière, under the auspices of the French government, found near Mentone. It lay in the cave of Cavillon, just within the Italian frontier, in a mass of limestone rock that hangs beetling over the Mediterranean. This cave-dweller, whose remains were, after a labour of eight days, heedfully removed, with the bed of funereal cinders on which they lay, and with jealous care transported to the Paris collection in the Jardin des Plantes, was of great stature. That he was old, his deeply worn teeth indicate. His skull is large and comparable to the finest heads in our museums. That the wearer of it was a chief or prince seems probable from the circumstances of his burial.

This cave-dweller's skull was covered, when found, by what the workmen of M. Rivière compared to a nightcap, but which was probably a head-dress of state, composed of numerous perforated coloured shells. There was also an anklet of similar shells, and necklaces of bears' teeth, the teeth of deer, and even of flint. The floor was thickly strewn with cinders. There were cinders and charcoal in a large shell. Weapons and tools

of bone and flint, the latter unpolished, lay near. Beneath the head of the skeleton were the heads of two spears, and on the forehead rested a curious instrument of bone.

These cave-dwellers had no bronze, and, it seemed, no pottery of which a scrap remains for us to see, no hand-mill, or grain, or seeds. In the cave were bones innumerable, of the great bear, the wild cat of Europe, the great wolf (happily extinct), of woolly rhinoceros and cave hyena, of five sorts of deer, of the hare, the wild pig, the antelope, the long-horned wild bull, the great goat, and a smaller bear. There were no remains of reindeer or wild horses, so plentiful in Switzerland and Gascony. Knives, arrow-heads, lance-heads, of flint, were abundant. There was in the Cavillon one bone-pin that seemed to be ornamental.

A cave in the Baoussé Roussé, or Red Rocks, also near Mentone, furnished, when investigated by M. Emile Rivière, the skeleton of a very tall man. The measurement was no less than two metres, or six feet six inches of our standard; and near this cave-dweller the bones of wild horses were found, with those of bear and wolf, of fox and hyena, of the wild hog, goat, and bull, and of hares of two sorts. There was also the skeleton of an eagle of extraordinary size, and the shells of many oysters. The giant's bones lay on a bed of cinders, with his weapons and ornaments around him.

A second search in the Cavillon grotto brought to light, along with stone, but not flint, implements, the skeletons of two children and a man of gigantic height, whose large bones reposed on cinders, and were decked with shells and pierced teeth. This warrior was of a different type. His head was, instead of being rounded or of a fine oval, like the skulls first mentioned, excessively long and flattened, while the under jaw was powerful and projecting, like the jowl of some ferocious Carib or martial Ashantee. His limbs and joints were of most unusual strength, and the general character of the head approached that of the skulls found in a peat-moss near Dunkirk, and during the late excavations in Boulogne harbour.

What little we know of the former inhabitants of France is full of strange contrasts. They dwelt in caves, exposed to peril, not merely from enemies brute and human, but of those land-slips and falls of rock so common among the honeycombed cliffs of limestone. Of metals, of pottery, of cloth, silk, or tanned leather, of fruits, grain, or domestic animals, they seem to have known nothing. Fishermen they were, and in a sense navigators, as their long and solid canoes seem to prove. Above all things they were intrepid hunters, contriving, with no weapons but spears, arrows, and tomahawks of sharpened flint, to slay mammoth and rhinoceros, lion and bear, to say nothing of wolves and bears, tigers and wild cats.

That they travelled, the mute witness of the bracelets and collar of the Dorlogne skeleton testify; while the skill with which, on a scrap of horn and with the angle of a flint, they could depict the wild animals in the chase of which their lives were spent, was, for savages, extraordinary. By burnt-offerings and the interment of arms and adornments they did honour to their mighty dead; while the rude plenty in which they lived is evidenced by the heaped-up relics of their feasts, forming a bed of bones and organic matter, often some feet in thickness, on the floor of the tribal

grotto. It is worthy of notice that the wild horse of these pre-historic times was no pony, as in America and Tartary, but an animal fully equal in dimensions to our domestic steed of to-day.

FALLEN FORTUNES.

CHAPTER XLV.—RETROSPECTIVE.

WHEN Dalton arrived at Liverpool upon the day of his leaving Riverside, it was too late to go on board the *Flamborough Head*, and therefore, notwithstanding his desire to be economical, he was compelled to sleep at an hotel. The next morning was a wet one; yet, for the sake of a few shillings, he sent his luggage by a porter's truck, and went down through the rain to the docks on foot. It was just such an arrangement of the 'penny-wise and pound-foolish' sort as those unaccustomed to frugality are wont to make; and grievously did he afterwards repent of it. He found everything on board in confusion; there was a difficulty, or seemed one, about getting at the contents of his portmanteau; his cabin indeed was infinitely better than he had expected, thanks to his wife's kind extravagance, and not a moment was to be lost in acknowledging that. One thing and the other, in short, combined to make him careless of so small a matter as damp raiment, and the end of it all was rheumatism in the knees. This is a malady—let those who enjoy the acquaintance of sciatica boast as they please—not easily matched for habitual discomfort, and it crippled Dalton. It was some time before he could leave his cabin and so much as crawl about the saloon, and even then he was subject to severe relapses. On one of his 'better days' he managed to make a grand tour of the vessel; he was on that part of the deck appropriated to second-class passengers, when suddenly his pains came on, and he fell rather than sat down upon a coil of rope.

'You are ill, Mr Dalton; shall I give you an arm?' said some one in cold but courteous tones; and looking up, he saw his half-brother.

The phrase 'More familiar than welcome,' which would have suited with the sight of Astor's face a few days back, had now no meaning for Dalton. Any face that he had known of old, and which therefore reminded him of home, was welcome to him.

'What! you here, Philip?' said he, with genuine emotion. A pleased expression flitted across the other's grave gray features; for hitherto his half-brother had been scrupulous to call him 'Mr Astor.'

'Yes, John, it is I. I suppose I must say I am sorry to see you, since you are outward bound, like myself, but, unlike me, have left so many dear ones behind you. You are in pain, I fear, too?'

'I have got a touch of rheumatism; that is all. But how came you here? I thought, from what Holt told me, you had left England some time ago.'

'It is not well to believe what Richard Holt tells you about anything,' answered the other bitterly. 'I should have thought you had found out that for yourself by this time. If otherwise, I am surprised

you speak to me, after what he must needs have told you about me.'

'He told me nothing, except that he was dissatisfied with you; by which I understood that you had parted company on account of some business disagreement.'

'Dissatisfied?' echoed Astor contemptuously. 'Yes, he has cause to be dissatisfied with me: he took me into his employment upon speculation—in the hope that, after all, I should make good my claim of legitimacy against yourself. He didn't tell you that, I'll warrant?'

'No, indeed,' said Dalton. 'On the contrary, he gave me to understand—though he never actually said so—that he retained you out of his regard for me.'

'Regard for you?' exclaimed Astor, with a bitter laugh. 'Why, he would have put all your money into my pocket—minus what he claimed as his own share—if the thing could have been done. I would have gained from you what I considered my own, Mr Dalton—as I still consider it—but I would never have played you false, as he did.'

'But you have quarrelled with him, you confess, yourself?' remarked the other cautiously. He had his own suspicions of his late business friend, but he felt that that was no reason for believing all that a personal enemy might say against him.

'Yes, we have quarrelled,' answered Astor frankly; 'and legally, it is I who have been in the wrong. He led me to imagine that I was his partner. The whole plot is plain to me now; but I was deceived as easily as a child by a trick at cards. John, tell me the truth. Did that villain ever hint to you that I had forged his name?'

'Never, upon my honour, Philip: he would not have dared to do it.'

'I thank you, brother, for that word,' answered Astor gravely. 'Well, he might have done it, and, in a sort of way, yet spoken what was true. He knew that I had meant no wrong, but it might have been hard to persuade others so. He gained a hold on me, at all events; and when I got to know more of his affairs than was agreeable to him, he used his hold. I am no felon, John, believe me; and yet, thanks to Richard Holt, I am transported. He has compelled me to leave England—as he has compelled you.'

'He has not compelled me,' answered Dalton haughtily. 'In fact, I am doing so contrary to his advice.'

'I understand,' said Astor quietly. 'He wanted you to part with your shares; but your motto was, "Stick to the *Lara*."

'Good Heavens, how do you know that? Why—Philip—it was you who wrote that warning letter?' exclaimed Dalton in astonishment.

'If four words can be said to be a letter; yes, I did. You are bound for Brazil, to discover if the advice be good, for yourself. Time will shew; yet I think you have acted wisely.'

'But, Philip, why should you have done so? Why should you have taken the trouble to do so

good a turn to one whose interests—and unhappily whose acts, though of necessity—have been so antagonistic to your own?'

'Well, there was a reason; for which you yourself owe me no thanks.'

'I owe you thanks, whatever it was.'

'No. The thanks, if they turn out to be owed to any one, are due to Kitty.'

'To my daughter Kitty?'

'Yes; and my *niece*,' answered the other. 'Listen, John. Years ago, when that unhappy litigation between us had resulted—though, as I thought, and as Holt thought, only temporarily—in my defeat, I set foot for the first time under your roof. We met; not cordially, but without ill blood; and you would have behaved, if I had permitted you to do so, with what you doubtless considered—and indeed what was so, from your point of view—with generosity. Well, we need not talk of that now. You refused to acknowledge me as your brother. As I left your house—full of wrath and bitterness—a little maiden, beautiful as a fairy, ran up to me in the hall, and with eager eyes exclaimed: "Why, you are Uncle Philip!" I snatched her up in my arms and kissed her. It was very illogical in me, no doubt—for if the little lady had known the circumstances of the case, she would probably have been the last to give me such a title—but I loved her for acknowledging the relationship that you denied. She has forgotten me, no doubt; but I never forgot her; and when years afterwards, I discovered—no matter how—that my employer, Holt, was bent on making her his wife—'

'Ah, you know that too, do you? I have sometimes suspected it,' said Dalton gloomily. 'Go on.'

'Well, I say, when I found that that false hound had dared to lift his eyes to Kitty, I swear I hated him for that worse than for all the rest. I had no means of foiling him, of course; but I felt that his opportunity could only lie in your necessity, and therefore strove to avert your ruin. What losses he has caused you, I know not; my belief is he made a cat-spaw of you from the first, and has robbed you right and left; but with the *Lara* he has still connection, that is certain. I heard from Brand (himself dismissed, like me, for knowing too much) that Holt was pressing you to sell your shares. And so I wrote to you to stick to them. That's the whole story.'

Much of this was of course news to Dalton, though somehow it only tended to confirm his own suspicions. Yet, after all, like them it was but vague. He had a greater distrust of Holt than ever, yet he had no more tangible ground than before for entertaining it. Had the opportunity, for example, been at once afforded him of returning to England and taxing his late business friend with malpractices, he would scarcely have taken advantage of it. No proof of any kind was to his hand. As time went on, however, and he got to know more of his half-brother, his confidence in him increased, and in proportion his suspicions of the man he had got by that time to consider their common enemy. The little episode of Kitty's reception of her uncle touched her father's heart, and out of it there flowed a tenderness not only towards Kitty herself, but towards him who had thus recalled her, and spoken of her so fondly; while the anger Astor felt against Holt for daring to wish to win Kitty's favour, combining with his own suspicions of that

intention, made somehow a still stronger bond between them.

The intimacy between the saloon passenger and the second-class man, as well as the unmistakable family likeness between them, excited considerable curiosity and some comment; and here, again, Dalton endeared himself to Philip by at once owning him as his half-brother, without saying a word of his illegitimacy. John's mother was supposed to have been married again to a person of larger means than her first husband; and hence the difference of the social position of the two brothers. It was generous of him—for it cost some sacrifice of pride—but Philip was more than grateful for it. No liberality which John had shewn him in the past touched him half as nearly. Unhappily, he was in no position to repay him; for he was going to Brazil, a mere adventurer, as friendless and even more penniless than his kinsman; but as a comforter and, when occasion required, as a sick-nurse, his companionship was invaluable. The two men would sit together for hours talking over Holt's conduct, chiefly in relation to John; speculating as to whether he had played him false in this and that affair, but especially concerning the mine. And then, for relief, they would turn to Kitty, of whom Philip was never tired of hearing; and from her John would diverge to his wife and the other children, and find at least a patient and apparently an interested listener.

It was curious how the adversity which thus knit John to Philip isolated him from the rest of his fellow-creatures. His genial nature had been nipped and frozen by its cold breath, and where the blossoms of wit and fancy had been wont to hang in such profusion, there was nought now but bare boughs. If to any one among the saloon passengers on board the *Flamborough Head* the social reputation of John Dalton was known by repute, he must needs have thought it ill earned. Dalton was, to be sure, an invalid; but even when he was able to take his seat at table, or hobble up to smoke a cigar upon the deck, he did not mingle in the conversation, but sat in silence and sad thought. He was polite, of course, and answered when addressed; but that was all. There were some young ladies on board who interested him, by some faint resemblance perhaps to Kitty or Jenny; but he was constantly asking himself how it was with Edith and the little household at Sanberk. The recollection of the unpaid premium to the *Palm Branch* also occurred to him, and gave him great uneasiness; for though he strove to believe that Mr Campden would surely discharge that debt for him, his thoughts were full of bitterness and disbelief in the loyalty of all friends. From the little gaieties and amusements of life on shipboard, he shrank with pain, except on one occasion. That pretty custom had just come in vogue of committing a miniature vessel, decked with ribbons, and named after some young-lady passenger, to mid ocean laden with letters for England, in hopes that some homeward-bound ship might pick it up, and act as postman. In this case, the fairy craft happened to be named the *Edith*; and since it could but carry a very limited mail-bag, there was much competition for the privilege of sending letters by it. The coincidence of the name with that of his wife, made John strangely solicitous to be one of the favoured few; and he succeeded in his desire. Perhaps his only happy hour on board the *Flamborough Head* was

during the launching of this fragile toy; his eyes were the last to watch it as it rose and fell upon the calm bosom of the ocean in their wake. After that day there was no more calm. Stormy weather set in, and with it the pangs of his rheumatism increased. He was confined to his berth, and day and night lay listening to the roar of wind and wave. Philip came to him, and sat by his side, conversing so long as it was possible to converse; but after a time the gale so increased that no human voice could well be heard.

One day—it was but noon, but the cabin window was so hidden by sheets of water that it was almost dark—John asked, with difficulty, 'Is there danger, Philip?'

His brother nodded gravely, holding on meanwhile to the side of the berth. The ship so pitched and lurched that the floor was as often the ceiling as the floor; the howling of the wind and the roar of the sea were deafening and incessant; but above them both could be heard hurried movements upon the deck.

'They are getting out the boats. Is it not so, Philip?'

'I will go and see. Do not fear, brother; I will not desert you.'

'I fear nothing—only for my poor wife and the children; thank God, I am well within the days of grace, however.' John Dalton's thoughts amid that whirl and woe were centred on the premium of his life-assurance. Presently the door was burst open—it would open in no other way now—and Philip rushed in.

'Quick, quick! You must get up; and I will carry you on deck.'

'Not I,' answered Dalton resolutely. 'What should I do, a poor cripple, in this tumult? Could I jump into a boat? Could I live in one, if I did? No. Let me drown in peace.'

Philip's only answer was to seize him in his powerful arms and drag him from his berth.

From thence, by immense exertion, he got him across the saloon; but up the cabin stairs, now steep, now sloping, and now staggering towards them like a thing of life, it was impossible to carry him: he was not only a helpless cripple, but every movement gave him torture.

'Leave me, Philip, leave me!' exclaimed he vehemently. 'God will reward you, though He will not suffer you to save me. Tell Edith my last breath was'—

There was a rush of water down the cabin stairs, that swept the men apart, and dashed the speaker senseless against the cabin wall.

When he came to himself, he was lying on the floor wet through; the turmoil of the elements had nowise abated, but the trampling and hurrying overhead had ceased. Sometimes all was in darkness—when the maimed and shattered vessel fell into the trough of the sea—and sometimes there was light enough to behold the devastation and wreck of the saloon as the ship battled to the surface, and was hurried on the crest of a wave. From her aimless and uncertain progress, it was evident that she no longer obeyed the helm, but was rolling like a log, now under, and now above the water.

If John's personal discomfort had been less, he might even now have congratulated himself that he had lived his life thus long, and had not ended it upon Bleabarrow Crags, as he had once thought to

do: Edith could now have no sort of difficulty in realising the five thousand pounds from the *Palm Branch*, and there would be no guilt of self-murder upon his soul. But his knees gave him such intolerable pain that he could think of little else. He contrived, however, to drag himself on to one of the couches let into the sides of the saloon, and presently swooned away there.

When Dalton next awoke to life he was in his own berth; the roar of the tempest had greatly diminished, but there was a slush and whirl of water in his ears; and he perceived—or was he dreaming?—that some articles in his cabin were advancing to and retreating from him in the strangest manner: they were in fact aloft. From the complete absence of any sound save that of the elements, it was plain to Dalton that the ship was deserted. Yet how, if this were so, could he have been conveyed back to his berth? His pains had abated, but he was faint and sick with hunger, and conscious of some strange disturbance in his brain. Was it a dream, or was it reality, that some one was splashing about the cabin? Dr Curzon, perhaps, upon his pony: yes, and with a prescription too, which he persisted in thrusting into his mouth—a mixture of bismit and brandy, which so revived him, that he presently sat up, and said: 'Hollo, Philip!'

'Hollo, old fellow,' answered his half-brother cheerily; 'the old ship floats, you see, still.'

'Yes; only the water is inside of her instead of outside of her; is it not?' said Dalton. It was a point that puzzled him, and which he really wished to have cleared up; but the other mistook it for a joke.

'Come, that is spoken like yourself, John. You are getting round now, though you have had a bad touch of it.'

Then Dalton began dimly to comprehend that he had been ill for days.

'Where is everybody, Philip?' inquired he suddenly.

'The ship is water-logged: as for the people, I don't know for certain,' answered Philip gravely; 'but I fear that you and I are all that now remain of them. That day when you saw me last—to know me—was one I shall never forget. The scene on deck was heart-rending. The women—You remember those two girls who launched the *Edith*?'

John nodded: he remembered their doing that.

'Well, they clung about the captain like poor demented creatures at the feet of their idol. Their shrieks, their cries for help, where no help could come, while the wind and waves stormed at them like devils, were terrible to listen to. The launching of the boats was with great difficulty effected; but some were staved in, and some were swamped with all on board, before our eyes. It was a sea, the captain said, such as it was scarce possible for a boat to live in. I told him how you were left below stairs; but he said, taking into account your maimed condition, you had as good a chance of life—if chance there was—in remaining there, as in endeavouring to leave the ship.'

'And you?' inquired Dalton, taking the other's hand and pressing it with what little strength he had.

'Well, I thought I would see the thing out along with you, John. The boats I verily believe are lost, with all that went with them; and the old

ship herself was bound to have gone down too, but for some empty casks it seems she has below.'

'There is hope in your eyes, Philip!' cried the other eagerly. 'Is a sail in sight?'

'No, indeed. Only, since the ship has floated so long, lop-sided and water-logged though she be—'

'There is land ahead?' exclaimed Dalton excitedly.

'You have hit it, John. There is land of some sort; and you must make shift to come on deck and look at it.'

A CO-OPERATIVE COMMUNITY.

ABOUT two years ago, the Black River, rising one night without warning, swept away a toy factory at Springfield, Vermont, U.S., managed by a Mr Ellis, who had invested the bulk of his savings in the concern, and found himself suddenly a poor man again. He had long believed that working-people could profitably become their own employers, and determined to risk the little the cruel waters had left him in giving practical proof of his faith in co-operation. Four good workmen, who had saved a few dollars, were found willing to make the experiment, and 'the Practical Co-operation Association' was formed; its avowed objects being, to provide each member with constant employment at remunerative wages, find him with wholesome victuals and a comfortable home at the lowest possible cost, and insure him a competency when his working days were over.

With a joint capital of a thousand dollars, the five 'industrials,' as they soon came to be called, commenced business as manufacturers of toys and fancy articles in a small workshop commanding water-power. They had no difficulty, thanks to Mr Ellis's experience, in finding a profitable market for their wares; and when it was seen that they could hold their own, plenty of men were ready to join the Association, and as every new-comer had to bring a hundred dollars with him, it was not long before the society owned its shop and another beside. Everything went on well with them until the spring of 1875, when the damage done by a fire frightened not a few of the associates into secession. The majority, however, 'stuck to the ship,' turned builders for the nonce, and at the end of a couple of months were busy at their accustomed work again; and they have gone on prospering ever since.

Upon making this second start the rules of the Association were revised. By the code now in force a candidate for admission into the community must be sound in body, blameless in character, a non-smoker, an abstainer from intoxicating drinks, and the possessor of three hundred dollars, which he pays into the general fund upon entering the society. When he has done this he is only a member on probation, liable at the expiration of his three months' term of trial to be voted out of the Association, if his co-workers so will; so that the industrials are not likely to be saddled with bad workmen or disagreeable companions. The affairs

of the community are managed by five directors, chosen by ballot, who appoint a president, a secretary, and a superintendent, and select those they deem best fitted to act as foremen of the shops. A member on probation receives a wage slightly in excess of the cost of his keep; but as soon as he is elected into the society, he is paid according to his ability; the rate varying between seven and a half and sixteen and a half dollars a week, the last-named amount being exceeded in special cases. What is done when a worker is incapacitated by illness we cannot say, information being wanting on that point. Wages are paid once a quarter. Not in full, however; four and a half dollars a week being deducted for board and lodging, and one-fourth of a worker's earnings being retained for investment in the Association's capital fund. Thus, a man earning fifteen dollars a week will at the end of three months receive eighty-eight dollars in cash, and have forty-eight dollars added to his capital; so that every member is compelled to save money and increase his monetary interest in the business. He cannot draw any money out of the fund, even the interest due to him being added to his capital, until it pleases him to withdraw from the community, when he—or in case of his death his representative—receives the whole of the money standing at his credit in the Association's books. What with the quarterly additions and the high compound interest, a member who holds on to the P. C. A. for ten years will find his original investment swelled to a very respectable sum. Boys and women are put on the same footing as men, save that the former need only bring in one hundred, instead of three hundred dollars to the common fund; while the latter are let off yet easier with a contribution of twenty-five dollars, which they are allowed to pay by instalments out of their earnings, and are only charged three dollars a week for their board and lodging.

Business meetings are held at regular intervals to consider the directors' reports and statements of accounts, and to fix the rate at which each worker is to be paid for the ensuing period; it being the strict rule of the Association that the interest upon the invested capital—which is fixed at eight per cent.—must be first secured; and if the dullness of trade threatens a falling-off in the receipts, the difficulty is met by reducing the wages until things recover themselves.

Every member is expected to be in his or her place when the machinery is started at seven in the morning; any one making an imperfect day being mulcted ten per cent. on the day's earnings. At twelve all adjourn to the home, where a good dinner is provided, and return to the shops at one and work until six. The Practical Co-operation Association does not recognise the Saturday half-holiday or any other holiday except the statutory ones. The American journalist to whom we owe our knowledge of the existence of this interesting community, visited their workshops one dreary afternoon when the rain was descending like a deluge. 'No one was to be seen outside the shops. Inside, however, little heed was paid to the weather. The noise was deafening, and every one was working with a vigour and earnestness that would have amazed me had I not known that each member was labouring with the knowledge that his or her industry was increasing the

resources of the community, and thereby adding to the wealth of each individual worker. Men and women were employed together—the men doing the rougher work at the machinery, while the women had lighter and easier labour. There was little or no conversation going on; the entire faculties of every one within the walls of the shops seeming to be engrossed, to the exclusion of everything else, in the manufacture of American flags of various sizes, intended to enable the patriotic youth of the Republic to becomingly celebrate the centennial fourth of July. The wheels flew round and round, as if they too shared the general spirit of industry and were actuated by a sense of personal responsibility. Sheets of muslin went in at one end of the presses white and glazed, and came out at the other damp with the freshly painted stars and stripes. As rapidly as nimble hands could seize them they were hung up to dry, after which the women pasted or nailed them to sticks, which were being manufactured in another room. The superintendent told me that the members had been employed in this manner for the past two months, during which period they have made and shipped not less than three-quarters of a million flags. In April they shipped about four thousand seven hundred dollars' worth; increased their capital by fifteen hundred dollars, and their joint wages amounted to eighteen hundred and twenty-three dollars.'

One good feature usually distinguishes the operative classes in the United States. After the hours of daily labour, they go home, shift their attire, and put on a dress resembling that of other members of the general community. In other words, they do not appear as loungers in the streets, unwashed, and in their working garments, as is too commonly the case in English manufacturing towns. Among the co-operators we are speaking of, there is visibly a high sense of self-respect. When the day's work is over they hurry to the boarding-house, to change their working-clothes for smarter attire ere they sit down together to an early supper; and supper discussed, set about amusing themselves according to their several fancies. Some go for a walk, some for a row in a boat, some try their skill at football and other outdoor games, while the stay-at-homes settle down to their letters or their books, or gather round the piano for a little music. As the evening closes in, the family gather together to indulge in candy-pulling—that is, drawing out great masses of molasses candy until it becomes too stiff to be pulled any longer. Then the dining-room is cleared for a game at forfeits; the penalties attached to the redemption sometimes affording amusement. At ten all retire for the night, and conscious of a well-spent day.

This curious industrial Association counts fifty-five members, ranging in age from sixteen to thirty, the sexes being pretty equally represented. The majority of the male recruits are steady workmen tired of enforced idleness, and the consequent melting away of their savings. Most of the women have been lured from the harassing, underpaid work of teaching by the prospect of being able to lay by something for the future while earning a present livelihood. They are said to be well endowed in the way of good looks, which may be accounted for by their admission

into the community depending upon the votes of male co-operators; although it must be owned that the latter have not shewn themselves oversusceptible to feminine charms, for only two marriages have taken place among the members since the Association was founded.

So far the Association has prospered. It has fulfilled its promise of providing constant and remunerative employment and a comfortable home for all belonging to it; whether it will last long enough to insure them a retiring competency, time only can tell. A trade-union that recognises the claims of capital; insists upon every worker working his best and being paid according to his ability; discountenances the idler, the shuffler, and the thriftless, and inculcates self-denial, is such a novelty in these days, that we cannot but wish it every possible success.

FOLLOWING UP THE TRACK.

CHAPTER V.

THERE are periods of our existence when long hours of passion, of emotion, of sorrow, and of conflicting hopes and fears, become epitomised and brought within the compass of a few minutes; when the mind becomes as it were almost omniscient in the extent of intelligence it takes in; realities and thoughts crowding upon the senses, and thronging in through the same narrow portal. It is mostly through the martyrdom of suffering that this supremacy of intelligence is attained, and the day in which a great calamity has been endured outlives in memory decades of happy months.

The steps of the strangers were heard receding, and the cottage door was closed. Could it be that they were some of the Whiteboys in search of arms? They would be disappointed; but though on such missions the lawless peasantry almost always acted with courtesy and tenderness to women, the thought was present, how great would be the alarm of Ellen. No! he would not delay a moment longer; and again he crept to the window of the little sleeping apartment, and grasping the sill, stretched on tip-toe, looked through the wood-work at the top, where a knot in the timber had dropped out and left a minute circle vacant. There were assuredly persons moving across the floor; but what were they doing? The time was one for energy of action; and gazing more fixedly, he was enabled to discern three men at the least; but he could not say whether there might not be more. Their faces were blackened, and having drawn a table into the middle of the room, they were bent down round something laid upon it. There was the sound coming in upon the drear quiescence of the night, of the heavy metallic clink of gold, not to be mistaken, and some of it was passing from hand to hand. The dread reality was revealed to the unhappy man. With one appalling shout of agony the husband rushed against the closed entrance-door, which yielded at once to the effort, and passing through the hall and kitchen, sprang into the bedroom, and with his huge staff levelled the

nearest ruffian to the floor. The light on the table was extinguished, but not before Maurice had seized another of the gang in his grasp. But at this juncture the arms of the assailant were suddenly relaxed; sparks of fire flashed from his eyes; he felt as if he were in a drunken revelry, or out at sea amid the swell and upheaving of many waters, and struck from behind with the butt-end of a gun, he became senseless, and at the mercy of those who had desolated his quiet and happy home. . . .

The bright but yet sedate sun of an October morning had long risen before Maurice Power awoke to consciousness; and still confused, he staggered to his knees, after one or two vain attempts, and then, with a painful effort, to his feet, and looking around, flung himself on the bed over the body of his poor murdered wife. If it be hard to leave those we love when long sickness has, as it were, acclimatised the sufferer and those who surround the bed to the atmosphere of another world—if it be hard to be reconciled to the idea that the wasted frame and the languid step of the loved one must soon be looked upon no more; and if we are reluctant, through the gathering mists of this earth, to look upwards and behold the radiance of heaven shining upon the home angel released from this prison-house of care and pain: what, indeed, must it be to part, when youth and health have been the gifts of but a yesterday? What is it to know that death has come in all its terrors; no voices to whisper divine truths into the ear, learned before but only now to be thoroughly applied to the conscience; no wondrous affection; no anticipating tenderness to supply every wish and thought of the paralysed tongue; no prayer to herald forth the bright future beyond the churchyard and the grave; the fainting spirit left alone—broken down and crushed, and doomed to pass across the dark stream which separates the mortal from the immortal!

Such or similar thoughts, if they could have found expression, were present to the unhappy tenant of the Glen farm; that farm for the retention of which he had lost everything. He was alone—that word in the very pronouncing of which there is a lament; for the slayers of his wife had not spared even his child. But one purpose alone was now to actuate him—namely, that of vengeance. Who, except those initiated in the brotherhood of sorrow, can realise the loneliness, the vacancy, the objectless condition of the man whose young wife had been taken from him! To see her no more on this earth; no more to bid her good-bye, and God bless her, as he goes forth to his daily business or to the distant fair—no longer to have her sympathy and affection sustaining him when galled by the slights, the slanders, and the reverses to which even the most successful career is exposed; to be conscious that she is under the same roof no longer; that no opening door will bring to him the light and sunshine of her presence; that the music of her gentle accents

will never more be heard! To whom could he now confide what were once his pleasures? To whom unburden his griefs? There are a hundred tributary streams which tend to swell the current of our affections; but when the parent source whence they issued has been dried up by some great calamity, they flow no more in their wonted channels. How truly has a great poet marked out the changed household aspect:

Wonderful!

Never to feel her thrill the day or night
With personal speech or act.

Clenched in the hand of the unhappy man was some evidently small object, which he regarded with especial and strange solicitude. He viewed it again and again, as if to guard against any possibility of mistake as to its identity, and finally folded it up carefully (could it have been by design, or in the mere abstraction of misery and grief?), placed it in an inner pocket; and having knelt at the threshold of the home which was to be his sanctuary no longer, and uttered prayers fervent and impassioned, in all the eloquence of natural emotion, turned away in the direction of Clonmel, to put the authorities upon the track, and to have the last dread offices solemnised for those who had passed away.

CHAPTER VI.

Nance Dwyer was the owner of an establishment in which wayfarers found a decent home at very moderate charges, situated about a mile from the village of Mulla, and about half a day's journey from Clonmel, travelling by easy stages. Her household consisted only of herself, a daughter and a nephew; but half an acre of ground planted with potatoes, and the like quantity of grazing, afforded no Savlanapalian luxuries; and as the district she lived in was sparsely inhabited, her ordinary humble lodgers were limited in point of numbers; no rural 'Claridge's' hotel for them, with announcements in the provincial *Morning Post*, of fashionable arrivals and departures; no *Trois Frères* to stimulate palled tastes with truffles in the highest perfection, and Lafitte of the most delicate bouquet; and as cynics describe society as consisting of only two classes—those who have money and no appetites, and others who have the appetite without the money, the guests of the widow were ordinarily of the latter type.

It was the advent of a large gathering in the village when Mrs Dwyer found herself overwhelmed with a sudden influx of visitors, some of whom were very unwelcome. Among them was a nomadic collection of thimble-riggers, card tricksters, self-created cripples, and the scum of society that seethes up at every racecourse and fair. Sheer necessity alone compelled Mrs Dwyer to keep the lodging-house in question; an extensive building, and the only property saved from the wreck of a spendthrift husband's inheritance. As some one has bitterly observed, 'Poverty is no crime, but it is worse'; and the lines on her forehead became more defined and numerous as years passed on, and the little child at her feet grew up until she had passed the frontier bounds between girlhood and womanhood. How painful that she should be even thought for a moment to have any

knowledge of the lodgers in her mother's place, when at a festive-time the place was crowded with the characters to whom we have referred. That mother had a further cause for deep anxiety, for her nephew, John Dwyer, who had been brought up by her with a loving solicitude, had of late years become wild and reckless, moody and dissatisfied with his condition, and for weeks would remain away, assigning no cause for his leaving home, and with no kindly word, no message to tell where he had gone or what he was doing.

There was one, indeed, to whom his moody changes of temper and his unexplained departures constituted the first great sorrow of her young life. Mary Dwyer had promised to become his wife if only her cousin would reform, and give up the wild companions with whom she feared he had become the associate; and with a contrariety of feeling often found, but never to be satisfactorily explained, the faults she wept over excited a pity and a sympathy which the acts of a better man would not have awakened. Shrinking from association with the persons who came to her mother's house, she would often urge her to give up the place; and when any doubt was expressed upon this change, she would say: 'I am young and strong; I will work for you; and as his Reverence told us the other day, when advising every one to rise early, the blessed manna in the desert could only be gathered in the morning, when the dew was fresh upon the ground. The work will also be a light to my soul when I think for what it is done; and when I go along the beautiful fields after my devotions, I won't then have the shame of thinking how the drink destroys so many poor fellows in the parish, and that my darlin' mother had her share in the blame and in the sin of encouraging them, by keeping some spirits unknownst to the ganger.'

'Don't mind that,' would be the plea of Mrs Dwyer: 'the boys will have the drop whenever they get it; and what else is there to make their hearts light? And the law allows you to pay for a license if you are rich enough.'

'Don't put your dependence on that, my darlin' mother. The law builds prisons, and gives food and comforts to the thief; while the honest poor are left to the charity of those scarcely better off than themselves. The law locks up the man who can't pay except by the sweat of his brow, and keeps him idle while his people at what was once his home are starving; while the owner of the big shop in the next town, who cheats the whole side of a country, goes up to Dublin, has a talk with some grand people there, who know nothing of his "character" before, and gets a bit of paper which gives him the right to set up again; and he is better off than ever.'

'We must not begin to think in that way, or it would drive me mad. We must honestly try to get the bit and the sup, and keep the shelter over our heads; and if some of our customers are queer in their ways, and free with the passionate word, the unkind deed, and the wrong to others; sure the treatment they themselves get from those who never knew what it was to rise fasting, or to sleep on the hedge-side under the bursting cloud, must be in store for them when they die, and speak for them while they are with us.'

'It won't do, mother, to try and put our faults upon others, who have their own heavy loads to

carry ; and I know this moment, from your looks, you do not mean what you say.'

'Well, another time I will think about what you are "discoursin'"; but we must hurry to get ready for the company that will be off in the morning on their way to the fair.'

Such was the conversation that took place between Mrs Dwyer and her daughter the night before the great half-yearly fair of Mulla, and six months after the events mentioned in the opening chapters of our narrative ; and a strange medley insisted on finding place in the abode of the widow, and even in the dilapidated sheds at the rear, the relics of better days.

'What trouble or ill-luck brings you here, Brien Spelassy?' interrogated Mrs Dwyer, laying particular emphasis upon the word '*you*,' as stirring about in the vain endeavour to find room for a sudden avalanche of guests, she addressed a man who had just passed the threshold of the door, after uttering the accustomed greeting : 'God save all here !' He was tall and well dressed ; intelligent, but unprepossessing in appearance, and with an equivocal smile playing on the verge of his mouth, as little genial or kindly as sunshine upon ice ; while his eyes, restless in their orbits, were never fixed upon any object except for a few seconds. A thick crop of fiery red hair, which not even the imagination of the most ideal poet could change into an auburn hue, crested his narrow and receding forehead.

'You needn't ask,' was the response of Spelassy, 'when Mary is to the fore, and makes the day dark if one does not get a sight of her countenance by times.'

This reference to her daughter was anything but pleasing to the mother, and with a bitterness of tone which she took no care to conceal, she said : 'I would rather have the *keeners* following her coffin to the grave, than see her living, if she was not to find, some day or other, a better home than either you or I could give her.'

'Is it a grand lady you would think of making of her?' retorted Spelassy, with a sneer. 'Is she to become the mistress of the great house beyant ; or do you expect she is to find a crock of gold in the fairy rath forenent the door that looks out into the ould meadow ?'

'No ; I am not the fool to think of getting her into a grandeur which would be strange to her. But she is a good and an honest child, though you see her here ; and just as my heart is breaking at the thought of dying, and leaving her alone among the waves of the wide world, the blessed saying comes into my mind, that the righteous shall never be found begging their bread.'

'You are only fit to join the Swaddlers with such talk ; but you may find in the end that there are worse matches in the country than Brien Spelassy's.'

As these words were spoken, the subject of this colloquy stepped forward from within the recess of the ample fire-place or nook, over the piled turf on the hearth of which hung suspended a huge iron pot in which was a mysterious compound ; although more substantial and savoury than the weird sisters in *Macbeth* had collected in their abominable pharmacopœia.

'Don't trouble yourself about me, Mister Spelassy'—and emphasis was attached to the '*mister*'—was the observation of the young girl ; 'for if there was never a boy in the whole of

Munster, barring yourself, you would have to go back alone. The bog of Allen, they say, is a big one ; but all the turf that is upon and under it, if set on fire at once, could not make my heart warm to you.'

'That's a strange saying,' retorted Spelassy ; 'but young women are never sure of their own minds for the length of a day ; every wind blows them about from one side to another ; and many a one who talked so big about hoping her friends would go to her funeral and wake, rather than be at her wedding, ended by being the fondest wife of the man she would have cursed.'

'I have heard of such things, and I have even known some who married those they did not care about, or even disliked, for the sake of the money, and for the shelter of a home as they fancied ; but no good ever came of the like ; and the priest who heard the confession of such a poor thing before going to the altar, might be inclined to think, from her tears, that instead of a blessing throwing light upon the threshold she was going to step over, it was the last rites of the church before death he was giving her. God knows that there has been trouble and darkness in this house ever since your shadow fell upon it, and you became so great with my cousin, John Dwyer. No luck or grace have we had since ; and now that the poor fellow has left us entirely for months, and without even a word or a message to say where he has gone, I feel as if the sun looks dim in the sky, and as if the night would never give way to morning again.'

It was manifest from the frank, open speaking of Mary Dwyer, that her heart was near her lips—that no coquetry, no false shame, operated to conceal the affection she bore to her near kindred, wild and graceless as he had become ; and she either disregarded, or perhaps did not notice, the ominous frown which darkened the brow of the person to whom her language had been directed. It seemed doubtful whether he would not give way to the passion with which his frame was quivering ; but he turned away with a manifest effort, and as he did so Mary heard, or fancied she heard, the muttered exclamation : 'You'll see him no more at this side of the Suir, anyhow.' As to the exact words, there might be some mistake, but that something in the nature of a threat was meant she felt assured. But there was no time for reflection, and it was better for her it should have been so, for at this time the place commenced to fill with a noisy and clamorous crew, and when her eyes, after a long interval, rested on the person of her rejected suitor, he was seated in the farthest corner of the kitchen, with three or four others ; and the frequently-replenished tumblers, and the lawless pleasantries which they inspired, were only ended when, under the exhaustion of the debauch, they rolled off their stools, and lay on the floor, faces flushed and brains heated, very beasts, but without their instinct or intelligence—overturned temples designed for reason to dwell in, but within which devils had raised their altars and enshrined their divinities.

The morning arose, with that freshness in the air which imparts animation and hope even to the wearied invalid, and its bright influences brought forth at an early hour the casual guests who had come to the fair of Mulla for the purpose of carrying on their respective avocations. The village in

question consisted of one main street, with lanes or passages diverging from it, and the mass of people gathered into it at seven o'clock was something marvellous. In front of the shops, and on the flagway, sheep and lambs were penned up, so that the passers-by were compelled to wend their uncertain course in the centre of the road, butted by terrified or ill-tempered cattle, assailed by droves of grunting swine, and flung against 'creels' filled with *bonives* and younger members and cadets of the same porcine family, whose shrieks were analogous to a sound then, however, happily unknown—namely, that of a railway whistle, when some doubting, cautious, intending purchaser took them up in his arms in order to ascertain whether there existed any traces of that dreadful distemper the 'red soldier,' or to discover their weight and good or bad points. Entrenched up against the channel-ways were primitive structures, hybrids between a wagon and a boat, over the top of which was suspended on ozier branches a canopy—salvage from the wreck of some dilapidated bedstead—and upon the dais beneath such grandeur were spread cuts of sawlow cheese, piles of gingerbread so stale and musty that they might very fairly have been assumed to have been found in one of the pyramids—the relic of some juvenile Cheops—toys whose machinery would not work; and in the immediate vicinity of these tolerated nuisances stood ranged piles of boxes, and chairs painted red and blue—the colours so glaring that some rustic pre-Raphaelite must have been the aspiring artist.

What a trade was carried on in the various houses where spirits constituted the staple commodity! Not a bargain could be completed, but it must be moistened with liquor; not a pretty or tidy young girl was accosted by an acquaintance of the other sex, but she must put her lips to the presented glass, and the wondrous solvent whisky caused all formalities to melt away under its magical influence, and unsealed the fountains of speech. The wealthy farmers, having sold their four-footed beasts to good account, met together in the various dingy drinking establishments to drive other bargains for the sale of their daughters or sons in marriage—for the truth must be spoken, and despite the dreams and the illusions as to rural singleness of affection, there are as many mercenary alliances patched up in primitive districts of Ireland as in the most aristocratic quarters of Belgravia.

Brien Spelassy had no cattle to dispose of at the fair of Mullin. He was neither a buyer nor a seller, but as if the animated aspect of all around him had in some degree softened his sullen nature, he was to be found in every part of the fair-green and village that day, assisting the farmers he knew in their various business operations—offering advice as to the expediency of giving an additional luck-penny to turn the scale in a bargain trembling in the balance—becoming an obliging ready-reckoner for those whose powers of arithmetic were of a limited character, and exchanging, for the guineas which were current in those days, the notes of the county bank then in favour. He happened to have a considerable supply of the latter, possibly because he did not find himself tempted to become a purchaser of cattle for himself or his principal, Stephen Meagher, and therefore prudently reserved his money for a more eligible occasion. From whatever cause arising, he made himself unusually

accommodating; and the only solution arrived at in reference to his proceedings was, that he must be looking out for a wife, and sought as a preliminary and inductive process to ascertain who were the most opulent of the fathers that day who had eligible daughters.

But there was another who also came to the village that day for no ostensible purpose, and he passed along, hustled by those of whose presence he seemed unconscious. His thoughts were afar off in the lonely mountain glen—at the door of the secluded and moss-covered cottage—by the side of the rippling rivulet that whispered its chidings and complaints against the rocky channels, which broke and impeded its waters in their way to the smiling valley in the distance; and Maurice Power, pale and haggard, and with the light of vengeance in his sunken eyes, paced moodily up and down through the thronged thoroughfare, more fierce and thirsting for blood than the leopard in the cage of the caravan, whose movements are watched with curious wonder and alarm by rustic spectators. But the fun and merriment, intensifying as the shades of evening came on, were too much for him any longer to endure; and turning away, he left the village, and walked on until he had reached close to the house of Mrs Dwyer, when his attention was attracted by the voice of Brien Spelassy, as the latter was passing out from its threshold. There was assuredly nothing in what was said to excite a stranger's curiosity or interest. 'I came back, Mary Dwyer, this blessed evening, to be made sure of what you told me. Think better of it, and change your mind, for you might find far worse husbands than I would make you.'

'Never, never!' was the response, uttered with passionate energy.

Surely the casual listener had heard the man's voice before, but when, and where, and under what circumstances he could not say. He leant against the adjoining wall, buried in thought, as if under the influence of some fearful dream, and then muttered with vindictive abruptness: 'He must have been one of them!'

The unconscious object of his notice passed on towards the fair-green, and Maurice Power's first impulse was to follow him, but restraining himself, he entered the house which the other had just left.

'Can you give me a lodging for the night, my good woman!' was his inquiry directed to the widow.

'If you are not hard to be pleased, there is a small barn where you can have a shake-down, and a bit of straw. To that you have my hearty welcome, and if I am not too bold in speaking, are you far from home, my good man?'

That word 'home' was like the poison-fang of a serpent—as agonising as the revelation which wakes a man from the illusions of a first love, and tells him that she who has become his world, and through whose sake every incentive to ambition and action has had its origin, cares not for him, and perhaps even worse, has given her affection to another. The pent-up waters burst forth, and the lonely wanderer, tears streaming down his manly face, replied: 'God help me, I have no home.'

It is hard to resist a woman's tears, even though they may disfigure the prettiest features, and many a silk gown which a husband's prudent economy would forbid, many a trip to the sea-side, is secured by such an influence. But a man's tears

are something as it were appalling, for never closes the eyelid of the effeminate or the selfish upon the great griefs that will reveal themselves through such a channel. Such tears are like the signs which indicate some revolution in nature, the heavy weight in the air before the sirocco, the silence which mutely heralds the rushing storm, the uneasy fear evidenced by the dull beasts and the birds before the upheaving of the earth. - 'And he went out, and wept bitterly,' are the pathetic words which express the agony and the shame of the ardent disciple of a Divine Master, when he denied Him thrice in an hour of weakness and of imagined worldly prudence.

The compassion of Nance Dwyer was at once excited, because she had herself passed through many a sore trial in the battle of life, of which the mysterious absence of her nephew was one of the latest; and it is ever found that in days of sorrow, distress, or danger, woman goes forth on her mission of mercy.

With the intuitive good taste which even the humblest Irish peasant generally displays, the widow did not inquire of the stranger the reason of his being homeless, but pressed his hand warmly, and merely observed she would make him as comfortable as possible. She was soon busied in preparing his humble supper, and when he turned to the hastily prepared crib which was to be his sleeping apartment for the nonce, the mother and daughter followed him to the entrance, and bid him good-night with the pious ejaculation: 'May the saints in heaven give you strength to put up with the crosses sent to you, and a happy ending.'

The next morning, when Maurice Power was about to leave the house, he drew Mary Dwyer aside, and with an earnestness that crushed the words between his lips, said: 'As you hope to see a better world than this, tell me all you know of this man they call Spelassy. Was he a friend of your cousin's, of whom I heard tell, and has he been much in his company?'

'I know but little of him indeed, but to my bitter sorrow he has been a good deal in his company for the last year or more, and until John knew him, a better boy there wasn't in the parish; always attending to his duty, and regular at confession; but the longer they were together, the greater was the change I saw coming, and myself can't account for his liking for such a dark fellow.'

'Do you remember when exactly your cousin last left this house?'

'I do indeed, as well as if it was yesterday. It was two days before Hallowe'en.'

'Do not think me too bold or inquisitive in what I am about to ask you, and that it is an idle curiosity makes me put these questions, but I want to know something about the conduct and the plans of this Spelassy. Has he since the time you mention been often talking to you of marriage?'

The question was one which in ordinary circumstances, and especially from a stranger, would have been an offence, but there was an earnestness about the interrogator which shewed he was not thinking of any conventional rules, and the quick answer therefore was: 'Indeed he has'—the warm blush of indignation flushing the face of the girl as she spoke—and when I turned away from him with the bitter hate in my heart and tongue, he looked as black as a December night, trying to keep in his

passion, and then almost threatened me as to what he might not do.'

'Had you any falling out or quarrel with your cousin before he left, to account for his staying away ever since?'

'None,' was the answer, 'for on the contrary he was as kind and as tender as would be a mother to her first-born; and he said, as we parted (for a dread came over me that same hour), "Mary, I have been of late what I ought not to have been, and I may be even worse; but let me only come back a richer man than I am going, and then we can buy the little farm on the hillside yonder, and for the rest of my life I will only think of you and my aunt, and strive to make you happy." But Brien Spelassy is waiting for me, and has come a good distance, and whatever is the business he has on hands, he says, must be done without delay.'

Further anxious questions were asked by Maurice, and as frankly answered, even though he was such a stranger, but none tending to cast light upon the cause of the absence of her relative; and with a promise to see her again, they parted with a kindly good-by from Mary. Through the dim obscurity of events, the homeless widow appeared to think that he saw a dim light breaking upon the mystery it was his life's object to solve. He gathered up the unravelled thread; coupled the intimacy of John Dwyer with Spelassy; their rather sudden and unexplained intimacy; their leaving the village together so shortly before the murder at the Glen farm; the subsequent disappearance of Dwyer; the dark suggestions of Spelassy to the young girl. But above all, came the conviction to his mind that Spelassy's was the voice he heard on the fatal night, uttering the words, 'I could swear I heard something strike against the wall.' Then there was the circumstance that one of the assassins must have been killed by the stroke of the staff, when he himself rushed in the fury of despair into the bedroom, and nobody was found the next day, nor any known person missing from the neighbourhood, or the town of Clonmel. These and other links, when woven together, formed a chain which almost converted suspicion into certainty; but a little reflection told the inquirer that he had no proofs with which to confront the object of his distrust. Like most of his class, he was intelligent and shrewd, and knew enough of the law to be aware that no magistrate would think for a moment of causing the arrest of any individual on surmises, vague, unsatisfactory, and shadowy; and he felt that here was he baffled at the very threshold of his inquiries. No red-skin tracking his enemy day by day over the boundless prairie, and forgetful of all sense of hunger or thirst in the excitement of the pursuit of his intended victim; no gambler within one throw of becoming a beggar, or the owner of broad lands and goodly possessions—a forthcoming Lazarus or Dives, but without the blessed assurance of the former in every aspect of his poverty; no youthful eyes trembling with the ecstasy of their first disclosure of love, could rival the intensity of purpose with which the solitary, broken-hearted man carried on his search after what was yet unrevealed, hoping to bring to justice the felon mercenaries who had robbed him of all in this world. And now flashed across him a fact not thought of before, but of obvious connection with the crime. Spelassy was, as he had ascertained, an inmate and assistant in the house of

Meagher the money-lender—the lad Clover, he also learned, was much under his influence and control, and why had he been so urgent with him to drink on that fatal night? It was in the private parlour of the inn that Maurice had fallen into the unaccountable and protracted sleep which enabled the foul work to be done without resistance. Why was he allowed to remain in the house without being awakened, when all the other visitors had gone away, and the doors were locked for the night? These and other questions required to be answered.

THE POEMS OF MRS G. G. RICHARDSON.

AMONG the class of forgotten or little known poets, we reckon Mrs G. G. Richardson, who lived and wrote half a century ago. Caroline Eliza Scott—such being her maiden name—was the daughter of a gentleman of considerable property, and was born on 24th November 1777, at his family residence, Forge, in the parish of Canobie, in Dumfriesshire, on the banks of the Esk. She enjoyed every advantage of education, and grew up to become an ornament of the most refined society of her native country, as she afterwards was of the highest circle of Anglo-Indian society. She is described as having been beautiful, affectionate, amiable, and of a cheerful temperament. She early displayed poetic talent, although it does not appear that any of her productions were published till she was more than fifty years of age. Whilst she was still young, she went to India to live with her uncle, General Harris, afterwards Lord Harris; and in 1799, was married at Madras to her cousin, Gilbert Geddes Richardson, the captain of an Indiaman. The marriage seems to have been one of affection, and congeniality of tastes contributed to a happiness which, however, was not of very long duration. Left a widow, with five young children, Mrs Richardson returned to Scotland, and found solace for her affliction in the company of her nearest remaining friends, and in the rural scenes which had been dear to her from her childhood. She devoted herself to the education of her children, and after some years took up her abode on their account in London, where she entered more into society than she had previously done since her husband's death. But when her object in so doing was accomplished, she gladly sought retirement, and fixed her residence in Dumfries. She died at her birthplace, Forge, on 9th October 1853, having nearly completed her seventy-sixth year. All her children survived her. Her life, unlike the lives of too many of the sons and daughters of genius, was tranquil and peaceful, a life of virtue and piety, of happiness not unclouded, indeed—for like others who live to old age she had to mourn the loss of many whom she loved, and one great bereavement threw a shade over more than half her days—but yet as constant as almost ever falls to the lot of mortals. Her poetry exhibits the depth and purity of her affections, her delight in the beauties of nature, and her keen appreciation of all their varying charms, along with no ordinary refinement of taste and culture of mind. It is not characterised by striking originality of thought, never soars to sublimity, and contains no outbursts of passion; but is clear and pure, sometimes sparkling, more frequently soft and gentle, like a stream that winds through a peaceful vale. The

versification is almost always smooth and pleasant, and often very sweet and melodious.

Mrs Richardson's first volume of poems was published in 1828, and soon reached a second edition. A second volume was published in 1834, and in so far as we are aware has never been reprinted, although it is perhaps, as a whole, superior to the first. Both volumes, we believe, are completely out of print, but may now and then be seen on book-stalls, where they are very apt to lie long unregarded.

It remains only that we should lay before our readers some specimens of their contents.

The sentiment of a soul in sympathy with nature, and ready to be powerfully affected by all its sights and sounds, is well expressed in the following lines of the first poem in the first volume:

Are there whose grovelling souls so ill explain
This lavish garniture of grove and field,
That nature's cunning work seems but to yield
Food for the flock, or shelter for the swain?

The inextinguishable love of rural scenes, loved all the more because connected with memories of the past, so that a feeling of sadness mingles with the enjoyment of their sweetness and beauty, appears in the following verses from a little poem, 'On Revisiting the Banks of the Esk, after an absence of some years'; that is, as the reader may easily infer from the brief notice above given of the author's life, on returning in widowhood from India:

Ocean has been between us, and the throngs
Of other shores—and some, alas! how dear!
Yet still to thee one crowning spell belongs;
Life's morning records were collected here.
Yes! fresh again the sunny scenes of youth—
The sights, the sounds, that vernal fancy fed,
Appear before me in their native truth,
But Hope, that promised more, th' eucharist's
Fled.

A poem called 'The Hushgill Burn,' the first in the second volume, is full of the same tender feeling, the same blending of sadness with delight, and also manifests not a little of that descriptive power, that power of presenting a whole scene by a few touches, which gives much of its charm to Smollett's 'Ode to Leven Water.' It is too long to be quoted in full, but we extract a few verses:

Thoughts like young rose-leaves on the gale
Are mingling with thy babbling tale;
The freshness of life's morning air,
The purity, the balm, are there.

A silver thread of memory—
A lute of sweet and tones—to me
An emblem of the past thou art;
O not of the care-haunted heart!

The past! the past! and still are here
The alders with their berries sere,
The willows dipping, and the beam
Of heaven on thy transparent stream;

The fair gray sands beneath desecrated,
Like bosoms that have nought to hide;
The minnow shoal, the lithe, the fleet,
That startled at our urchin feet;

The primrose tufts—but where, O where
(Gems of a cluster once how fair!)
The dear companions—withered—dead—
Thy willows once o'ercanopied?

'Tis strange to see thee flowing on—
They, like thy early waters, gone,

Changed, vanished, gathered with the past !
Thou smiling as I saw thee last.

A few brief years, and they shall be
Even swept away from memory,
Recalled no more by sight or sound—
Thou still as now exulting found.

Similar in character to these verses, and full of charming pathos, is the following poem :

STANZAS WRITTEN IN OCTOBER.

The leaves are falling all around—
Reluctant, waveringly they fall ;
The river has a moaning sound,
The redbreast's notes are low and small.

With boiling croak and flagging wing,
The rook sails slowly o'er the sea ;
Time's annual shades are gathering,
And winter's coming step I see.

Each falling leaf 's a moral page ;
Time's myriads thus are trodden low ;
Each season of our pilgrimage
Has voices warning as we go.

We hear, but heed not, nature's knell ;
We see, but mark not, time's decay ;
We cling to pleasure's flowery spell,
Till every leaf has dropped away.

In a very different vein, but very beautiful and touching, is the following :

THE FALLEN CHAPLET.

She sat apart ; the circling throng
Were waiting for her thrilling song ;
Long did she prelude, long and low,
Before her sweet voice utterance found ;
And then, the very soul of woe
Was in the sound.

Her lips were pale, but either cheek
Flushed ever with too bright a streak ;
Fair was her brow, which roses crowned ;
And, as she trembled with the swell
Of that sad song, upon the ground
Her chaplet fell.

He caught it up, whose ear and eye
Seemed worshipping her melody ;
He pressed it fondly to his breast ;
She saw the action : 'twas too late !
One earlier word had made her blest ;
It was her fate.

Too long deceived, too sorely tried :
Oh ! was it love, or grief, or pride ?
But the fall'n chaplet ne'er again
Shall wreath her brows : for wildly gashed
From heart and harp one farewell strain,
And both were hushed.

We conclude our extracts with a poem founded on the mention made of Antipas in Rev. ii. 13, in the epistle 'to the Angel of the Church in Pergamos'—'And thou holdest fast my name, and hast not denied my faith, even in those days wherein Antipas was my faithful martyr, who was slain among you.'

ANTIPAS.

And who was Antipas ? and where dwelt he,
The martyred 'faithful,' honoured of his Lord ?
Had he, as men count honour, high degree ?
Or was he nurtured at a peasant board ?

Vain questions these : the inspired words afford
His crown and claim ; he perished gloriously.

And many a deed shall wither with Time's scroll,
That shook the earth—and many a name, whose
sound

Went forth triumphantly from pole to pole,
Shall drop into oblivion, unrenowned,
When he, thus briefly chronicled, is found
In heaven's high registry, a victor soul.

Needs not for entrance there the laurelled crest,
The distant battle-field, and trumpet's din,
Nor history's sounding page ; the sealed breast
Hides man's true history, whose worst foe's within !
In daily conflict with the legion Sin,
Souls may the martyr's crown and triumph win,
Unknown on earth, unhonoured, and unblest.

Besides the two volumes already mentioned, and from which these extracts have been taken, Mrs Richardson published no other poems, but she continued during the latter years of her life to write verses, which, we are told, still remain in manuscript in the possession of her friends. She also wrote tales, some of which appeared in journals and magazines.

ODDS AND ENDS.

TENACITY OF MEMORY IN A PONY.

I ONCE had a handsome little chestnut pony, whom I called Dick, and of whom I was very fond. Whenever I visited my stables for the purpose of looking at my horses, which was seldom less than three times in the twenty-four hours, I invariably spent a few minutes more with Dick than with any of the others, and rarely went near him without a piece of bread as a treat. He was as much attached to me as I was to him, and he always hailed my approach to the stables by a stretch, a neigh, and a paw. He would throw his head over my shoulder, and nibble at the pucker of my hat, lick my ear, and show his affection in every possible way. After having had him for several years he began to knock his hind feet against his fetlock joints, and finding it unsafe to ride him, I sold him to a friend equally fond of horses as I was myself, but of lighter weight. We thus parted company. My friend left India some time afterwards, and I quite lost sight of Dick. It was about *six years afterwards*, when on a visit to a friend in a distant part of the country, I was asked to come and look at a nice little pony he had just bought. The stable being somewhat dark, I had the pony brought out into the yard, and after taking a general look at him, proceeded, as is usual on such occasions, to examine the back sinews of his fore-legs, and age him by looking at his teeth. While engaged in the former operation, the animal gave a snort, and shewed some impatience at the groom, who was holding him tightly by the head. On attempting to look at his teeth, he forcibly raised his head, placed it on my shoulder, and began to manifest his old signs of regard. Never for a moment thinking that it was my old pony, I at first imagined some mischief was intended, and started back ; but a second look at him, and a reference to the spots where he used to knock himself, left no doubt in my mind as to his identity. It was, in short, my old companion Dick. When he saw that I had recognised him, he neighed as of yore, pawed, and looked happy. He had several pieces of bread that day and for several days after, when we parted for the last time.

ON THE CHERWELL.

MANY a summer visitor to Oxford has pleasant memories of the little stream winding with its many branches amid Magdalen Walks, and then on to Christ Church Meadow, and so to the Isis. On sunny afternoons, especially during the time the Eights are practising for the world-renowned boat-race, you may see boatload after boatload of fair visitors, decked in all the colours of the rainbow, pulled by no less bright-hued collegians, proceeding up the Cherwell to Magdalen, there to hear the afternoon service chanted by the famous choir; and then returning in the cool evening in time to see the second and higher division of the Eights. The 'Varsity pronounces it *Charwell*; the town, I believe, *Cherwell*, as it is spelt. I don't know whence the distinction arose, nor what was the origin of the name.

Oxford weather, even in the summer term, is fickle, and this summer was more than usually cold; so it was quite late in the term that I conceived the idea of passing the afternoon in my favourite manner, by taking a punt, and proceeding at my leisure up the Cherwell until I found a shady spot where I could moor my roomy craft and doze away the sultry hours with a book. This is a very favourite way of spending a hot afternoon at Oxford, and on such days every nook of the Cherwell has its occupants, who stare lazily at the passing boats. Now every one knows, I presume, that a punt is a flat-bottomed boat of heavy structure, propelled, even when the performer is skilful, but slowly, by means of a long pole. A long pole I say advisedly, for narrow as is the Cherwell, its depth in some parts is considerably over twelve feet. These punts, common enough on every ornamental water, and used for fishing, are at Oxford provided with sundry large and small cushions, the former of which are termed beds, and are exceedingly comfortable.

We are very gregarious at Oxford, and do everything by pairs if possible, though we do not carry the thing so far as we did at my old school, where we thought little of the status of any one who went

alone even a yard beyond the school-gates. This was very trying for new boys, unless they at once chummed together. I remember now what an unpleasant ordeal it was to go to football alone, conscious of the sneers and scrutinising glances of the fifty or so pairs of boys whom I met or passed. So, to return to the 'city of bells,' as we, annoyed by the constant clanging, used to call it, I lounge off to a clump of mine, generally nicknamed *Tiny*, whom I find commencing lunch with no very clear ideas as to the afternoon. Him little loath I press into the service; and after joining him at his meal, we get into flannels, and set off a little before two for *Salter's Raft*. This is earlier than we usually begin the afternoon's amusement in Oxford; but since the day is very hot, there will be a corresponding demand for punts, of which the supply, as they are only wanted in summer, is rather limited. As it is, there is only one left, and that has but one bed; so I make a raid on the interior of the barge, and after some altercation with *Salter's* men, by judicious outlay, carry off in triumph a brand-new bed and a couple of rather frowzy cushions. Thus equipped, *Tiny*, who is an accomplished puntsman, takes the pole, and we slowly glide down the river with the current.

The Cherwell runs into the Isis only about a hundred yards below *Salter's Raft*, and just at the bottom of the line of college barges which every visitor to Oxford must remember so well. They look gay enough to-day in the sunshine. The 'Varsity barge has its line of flags hoisted; and *Oriel*, the low barge with the oval windows, has hauled up its flag, so I suppose its regatta is on to-day. College regattas are not very amusing except to those engaged in them; so we shall not be tempted to stop. Now we are turning out of the Isis by *Queen's* barge, and entering the Cherwell. *Tiny* will have to mind what he is about here, for the hole is hardly fathomable by the twelve-foot pole. I know no greater luxury than lying on your back on the cushions in the forepart of a punt, while a friend lazily shoves you along, and the water at each stroke plashes gently beneath your head. On our left now we are passing the walks round Christ

Church Meadow; and if you stand up you can see Merton Tower, tall and massive, and just underneath it the walk called, I believe, the Dead Man's Walk.

It is rather early, and we have the river pretty well to ourselves. By three o'clock there will be bustle enough upon it. The only boat in sight is a punt ahead, which disappears round each corner, and then appears again before us in the straight reaches, the white jersey of its propeller glimmering through the overhanging branches as he stands upright in the stern.

There on his usual seat is the good-humoured old Humane Society's man, with his punt moored against the wall, and the life-buoy hanging on its post. They have some work now and then on the Isis, but most men can manage to swim out of the narrow Cherwell. To the right up there across one field is the Christ Church cricket-ground, whither half-a-dozen men are crossing the ferry to pitch the wickets for 'practice.' And so, leaving the cricket-ground behind, we glide past the Botanical Gardens on our left, and as we turn the corner see the superb tower of Magdalen and the fine bridge beneath it. On the top of Magdalen Tower, as I daresay you know, the choir sing a carol on the first of May at daybreak; while, according to the same immemorial custom, the town's-people, or rather the boys, at the foot of the tower, try to drown the sound by blowing peculiar horns, which make night hideous, a week before. They beat the bounds too in Oxford on some day in May; and mightily was I astounded when I first saw our usually quiet quadrangle invaded by a troop of small boys with willow-wands, and headed by some parish dignitary who led them in a lusty cheer, while generously disposed men threw gifts out of window for them, chiefly consisting of oranges, but including also a well-worn box-hat and a remnant of a coal-scuttle.

But to return to the Cherwell and Magdalen Bridge, under whose cool shade we glide to the music of the pole rattling among the pebbles in the shallows. Now we have the shady walks of Magdalen on our left, whose overhanging trees darken the quiet water. We are pretty well at our voyage's end now, for here is a convenient place to anchor, where we can fasten our painter to an old tree, whose trunk reaches nearly across the stream. There, now we stick our pole firmly in the mud, to prevent the stern swinging across the stream, and with a bed and cushion apiece, settle ourselves at either end of our spacious vessel. My friend lights up, and we proceed to lazily dip into our books. Mine is 'Stretton,' a great favourite, which I have already once got through. Tiny, who is in for 'Mods' (as we call the 'First Public Examination' of the Dons) this term, is beginning to doze over a Demosthenes. But we are both aroused from our day-dreams by the increased bustle and hum, and I turn on my side to watch the passing boats, which are so close upon one another that they form a regular procession. Here

is something really gorgeous coming up; a couple of men in canoes, their coats a bright magenta, their caps black and white; that is the uniform of Magdalen, and they are probably going up to their tennis-ground, which is near the river higher up. If you were to climb up the bank on our left you would see the new buildings of Magdalen; but as they are very ugly I don't think that they would repay the trouble. Now the stream has become a regular highway; fleets of canoes with noisy occupants, running one another down both literally and metaphorically; punts move along slowly, sometimes with two puntsmen, now with one, while his companion lies in the forepart reading, whose attention—which is not even distracted by the bumps with which ever and anon the punt is run aground—is pretty clear proof that his book is not a Demosthenes. It is amusing to watch the various fashions of punting which men adopt. Some shove from the bows, standing still, and pushing first on one side and then on the other; but this is an inferior plan, and declares the novice at once. The professional punter, standing about the middle, pushes on one side only, and walks up and down, as the ancient galley-slaves did with their oars. But most undergraduates stand in the stern and push on the right side only; and this plan, by which, with a little practice, a fair rate of speed can be attained, is the one most commonly observed. And here come whiffs and pairs, and even an adventurous four-oar, which seems determined to bark all the trees and knock down all the imbedded punt poles, thus earning the deep anathemas of my friend Tiny, who objects to having a volume of water dashed over his Demosthenes, dry, albeit, though he finds the arguments of the *De Chorod*. Here too is a double canoe, to hold two men, driven along at a good rate with paddles made like those of the Indians, with a blade only at one end. It is, I believe, the only one of this description at Oxford. Dinghies too are here in crowds, sculling-boats made to hold a coxswain; in fact, only one description of craft with which I am acquainted is not here, and that is the wicker coracle so well known on the Severn, but which I have never seen on Isis. Some come on with shout and laughter, echoing beneath the trees; some glide noiselessly up to us; but when I hear a little extra uproar, I know that a squadron of canoes is coming round the corner.

But see, here is indeed a stout craft, and stout it ought to be, for precious, at Oxford of all places, is the freight it contains. By their blue coats worked with the cardinal's hat we may know the rowers for Christ Church men; but those in the stern, for there are two of them, to what college do they belong? Their colours are pink and blue. To none but Mr Tennyson's:

With prudes for proctors, dowagers for deans,
And sweet girl-graduates in their golden hair.

I am sure that if the softer sex know how they were appreciated at Oxford, they would flock

thither at once. You cannot conceive with what envious glances we look on the men in attendance on them; with what eagerness we listen, feeling ourselves for the moment such outsiders, for the silvery voice and merry laugh, as the bulky old pair-oar comes, under their guidance, into collision with the stump of a tree, or the punt of a man who has done everything except upset it in his frantic attempts to get out of the way of their sinuous charge, and who, when they have passed, feels like the clumsy adorer who has torn his angel's dress in the waltz. There are several boatloads of the said angels passing up, for it is the heart of the summer term, and wherever they come the shouting is stilled, and men lying apparently asleep in the bottoms of boats, rise up and gaze after their retreating figures as the bright colours gleam in patches on the dark over-arched water.

It is very pleasant here. The sun glints here and there through the trees, and falls in fantastic spots of light on the stream; and the laughter and voices come through the sultry air, mingled with the distant notes of the band playing in St John's Gardens. The water is quieter now, and free from boats, the upward stream of which has ceased, and will soon begin to dribble down again more slowly, as the receding men hasten home to get there before dinner-hour. Close to us in a canoe is a man, by his black coat bound with yellow, of Brasenose, deeply immersed in a yellow-backed novel, with his knees higher than his head as he reclines in his frail vessel. Once when I was doing just the same thing on the Severn in my school-days, the canoe floated sideways on to a post, capsized, and turned me into six feet of water. I soon got out again, and was very proud afterwards of the presence of mind which enabled me to hold on to the book and thus preserve it. I paddled a little more swiftly down to the old schools, to get a change and a drop of something hot at the tuck shop, which drop was more comforting because contraband.

But Tiny is getting tired of his work, and unmooring us, shoves me, reclining at my ease, up the now quiet stream. Nothing passes us, but we meet many boats returning, for the tide has turned homeward. We reach the light wooden bridge where the stream divides, the left-hand branch leading to the Magdalen private water and to sundry mills; the other to the renowned Parson's bathing-place, nearly a mile farther up. Across the low fields on our right we can see the queer little church called generally the 'Rabbit,' because of a comical resemblance in shape to that animal, the squat tower at one end representing the head, while a sort of chimney at the other does duty for the cocked-up tail. I jump up as a sudden splashing, followed by a roar of laughter, arises just in front. An unfortunate man in a punt, apparently trying his hand for the first time, has first lost the pole, by leaving it sticking in the mud, and then his balance; and is now, amid much concealed and unconcealed amusement, wading, a miserable sight indeed, to shore. Pleasant as the Cherwell is in other respects, its waters are not over-clean; and the thick, ill-smelling mud which caused his misfortune now makes his companions refuse to receive him again into their craft; and it is only after much supplication and a little cursory conversation also that they are prevailed upon to put him across on to the Magdalen side, that he may

run home; a favour rendered ungracious by the loud demonstrations of disgust and signs of affected faintness in which they indulge in the funny manner of undergraduates on such occasions. But we must be returning ourselves; for now the bells of several colleges are heard faintly in the distance ringing for chapel, and announce the near approach of five o'clock. Just in front of us is another punt whose occupant seems to wish to share the bath we have just witnessed. All his efforts only have the effect of causing his boat to describe a circle on its own axis every four or five yards. How in the world he got up so far puzzles me; while as to his prospects of speedy return, Tiny benevolently observes: 'Ah, I should think he'll get back in time for the Long.' Still he appears to be of a sporting temperament, for when a large water-rat appears he shies his pole at it; and then, having thrown away his last hope, appears inclined to plunge in after it. We, however, gain his gratitude by punting back and restoring it to him. No doubt by the time he reaches Salter's, practice will have brought him nearer perfection. When we reach Magdalen Bridge, we are assailed by offers from very small boys to take our punts home for us: it strikes us that they will find an easy prey in our friend behind. As we pass under the bridge, a college drag, with its three horses abreast and freight of flannelled cricketers, passes over it, returning from the Cowley grounds. We are too early for the London coach which started this summer, and whose arrival to the moment every other evening, has become a feature and excitement of Oxford life. So we pass on till we come to Christ Church ferry, where we get into water too deep for our pole, and have to wait till we drift in to the shallower water under the meadow wall. The Isis is gay with boats when we emerge on it; the New Eight paddle by in their purplish coats bound with orange, the water tossing from their oar-blades as they feather, looking in the sunset like silver in a sea of gold. But stay a moment; let us hold on to the Christ Church barge, for I see a canoe race is just going to start, and that is always fun. There, half at least have upset in getting their boats into the water, and some of them are swimming and pushing their craft before them; some are striving to get in again; futilely, as a rule, since the canoes turn over like floating barrels and duck them again and again. One I see, mounting at the end, has got astride of his, and is paddling along with both legs in the water. But while he and his swimming companions are struggling, the more fortunate ones who have not been upset have arrived at the mid-goal, a tree on the shore, have pulled their canoes round it, got them in again, not all with the same luck as before, and have raced back; two alone, the first and second, coming in unducked. But since the prize is small and the day very hot, I don't think that the others have had much the worst of it.

Come along now, or we shall be late for hall. This last bit against the current is hard work; and men lying under the awnings of the various barges glance with amusement at our struggles. But Tiny's skill is too much for the current, and his way of handling the pole gains approval from the bargemen. So we get to Salter's safely, and disembarking, thread our way swiftly through the crowds that are hastening up the Long Walk. Tiny is grumbling that he has done no reading hardly,

and most unjustly blames me. Still, as I think that he will get through, I don't overburden him with commiseration, but make off to my rooms to change, well content with my lazy afternoon.

THE FOLK-LORE OF ROME.

It is now beginning to be well understood that fairy tales and other thrilling narratives which entrance and serve to cultivate the imagination of children, are for the most part of no particular country, but prevail nearly everywhere. Stories, for instance, such as Cinderella, the Seven League Boots, Beauty and the Beast, and Jack and the Beanstalk, are told to children in almost all the languages of Europe. Who invented these stories, or how long they have existed, no one can explain. They may be thousands of years old, and yet to every new generation they are as fresh as in the days of yore. What Grimm did for the history of old legends in Germany has just been effected by Miss Busk for Italy by her work on *The Folk-lore of Rome*.

In the process of collecting the materials for this amusing work, the author had many difficulties to encounter, not a few of which arose from the pride and independence of the Roman peasantry. In spite of all obstructions, however, she persevered in her task, and finally accomplished it, dividing the stories which she collected into four categories: first Favole, fairy tales proper; then Esemplj, stories in which some moral is conveyed; then ghost and treasure stories and traditions of old families; and finally Clappe, a word for which we have no exact equivalent in our language, but which means gossiping stories, tales of simple folks, and of the mistakes which their simplicity leads them into.

In the class of Favole, the first story, 'Filigranata,' with its ever-recurring refrain of,

'Filigranata, so fair, so fair,
Unloose thy tresses of golden hair,
I, thy old grandmother, am here,'

has, as Miss Busk points out, items which are to be found in the fairy tales of almost every language. It opens in the same manner as many of the Norse tales do: the orange and pomegranate, the trowel, comb, and jar of oil which figure in it are frequent concomitants in the West Highland tales, as are also the birds; and the kiss which was so nearly fatal to poor Filigranata's prospects, occurs with the same result of forgetfulness in the traditionary tales of every country in Europe.

Then we have our old acquaintance Cinderella and hosts of others, among which the favourite fairy tale of Beauty and the Beast recurs in many forms.

These stories, of which the Dark King is one, have little or none of the heroic element which is found so plentifully in the Norse, German, and Breton fairy tales; neither do they deal much in horrors; and the wild men so often to be met with in the Teutonic legends are almost unknown.

Next in order to the fairy tales proper come the Esemplj, of which the first seven legends relate to our Saviour and to what He did and said when He wandered about among men upon the earth. These produce, from the homely familiarity of their details, a curious impression upon the mind, as when we are told in one that St Peter was a great eater, and in another have Death familiarly, even jauntily personified as Mrs Death; the good lady, still more to set us at our ease, being represented at such pleasant gambols as climbing up a fig-tree and sticking fast there.

Then follow tales in which St Anthony, St Theodora, St Vincent, St Philip, and a whole host of other canonised individuals figure. Padre Filippo, we are told, went one evening to the house where a certain Cardinal Gastaldi, who was very fond of society, was enjoying himself. Going into an empty room, he asked that the cardinal might be sent to him, and when he entered, addressed him thus: 'Your Eminence; come to this window; I have something to shew you.'

The cardinal came to the window as he was desired, and looked out, but instead of the houses, he saw pandemonium opened and all the souls in the flames; a great serpent was wriggling in and out among them, biting them, and in the midst was a gilt cardinal's chair.

'Who is that chair for?' quoth His Eminence, who for once felt no ambition for the chief seat in the synagogue.

'For you,' responded Father Filippo.

'What must I do to escape it?' exclaimed the conscience-stricken man. Upon which Padre Filippo read him a lecture upon penitence and amendment of life; by which it is comforting to read that he profited, and turning over a new leaf, became as devout as he had been heretofore profane.

One day the same Padre Filippo, who is a very favourite saint with the Roman people, was walking through the streets, when he saw a crowd much excited standing round the door of a house; and inquiring the reason, was told that a man was beating his wife because she was so ugly. After a time the husband became tired of this exercise and went off; and then Father Philip went to the poor woman's house, and knocked at the door, which she immediately opened to him; but prepared as he was for a total absence of all attractiveness in her appearance, she was so very ugly, that when he saw her he could not help starting. He, however, said nothing, but made the sign of the cross over her and prayed fervently; and presently she became so extremely beautiful that no one could see her without remarking her. 'Your husband will beat you no more,' said Father Philip as he took his leave, overwhelmed with her thanks.

Now this woman had a neighbour, who was as beautiful as she was ugly, and as bad as she was good; and it occurred to her, that as Padre Filippo had apparently acquired the art of making beautiful, perhaps for ever, she had better go at once and

take advantage of his skill; so she presented herself before the door of his cell, and asked him to make her handsomer than she was; but Padre Filippo, like a good and discerning saint, knew almost without looking at her that she was a woman of quite a different stamp from the other; so he prayed and made the sign of the cross over her also; but with a very different result. From being handsome she became ugly, even uglier than the other woman had been. Of course she was furious when she consulted a mirror she had brought with her, and saw the fatal change the short prayer had made in her appearance.

'Why have you treated me differently from the other woman?' she exclaimed indignantly.

'Because,' answered the saint, 'beauty was of use to her; but you have used the beauty God gave you only as an occasion of sin; therefore I have removed a stumbling-block out of your way.'

The next category includes ghost stories and local and family traditions. The ghost stories are not numerous, and are held in such general contempt and scorn that it is almost an insult to ask for one. With local and family traditions it is quite different. The Roman peasantry treasure up everything that relates to their great families, and recount the legends connected with them with all the gusto of a Scottish Highlander. The sad story of Beatrice Cenci is often told, with many variations, as are also stories of the Colonna family, and of a certain Donna Olimpia Pamfili, a lady of boundless pride and ambition, whose husband was a brother of Innocent X.

Treasure stories abound, and although as a rule the people do not believe in ghosts, they have a firm faith in the existence of vast hoards of buried treasure. All this wealth they fancy was committed to the keeping of the earth under a spell, and can only be discovered and removed by some person who is fortunate enough to invent a counter-spell, or who has stumbled accidentally upon the words of the original incantation.

A countryman who saw Miss Busk sketching the old ruin of Monte Rufiano, on a height not far from the banks of Lake Thrasimene, told her that under it there were vast hoards of buried treasure, which was guarded by twelve spectres, who regularly as Good-Friday came round, formed themselves into a ghastly procession, and torch in hand, perambulated the ruins.

Ciarpe, the last class of stories with which Miss Busk deals, contains one or two, such as 'The Little Bird,' 'The Value of Salt,' and 'The Simple Wife,' which, in a slightly different form, are not unknown in our nurseries; the others are peculiarly Italian, and as such have the advantage of novelty, as, for instance, the following:

A countryman was one day driving a pig before him to market when he fell in with two monks, the Superior of a Franciscan convent, and the porter. 'Let us have some fun with this fellow,' said the porter to the Superior. 'I will call his pig an ass; and when he gets angry, I will say: "Well,

let us refer the matter to the Father Superior, and if he says that I am right, I will keep the beast for myself." Then you will join in the conversation, and say it is an ass, and we will keep it of course.'

'Agreed,' said the Superior; and when the countryman came up, the whole farce was gone through; and the pig changed masters, greatly to its owner's disgust.

Meditating revenge, he dressed himself at nightfall like a poor country girl, and presented himself at the gate of the monastery just as a storm was coming on, and ringing the bell, demanded shelter for the night.

'Impossible,' groaned the porter, looking through the wicket; 'we cannot have a woman in here.'

'But the storm,' clamoured the pretended girl, 'and the dark; you cannot leave me out here to perish from the inclemency of the weather.'

'But we can, and we will,' said the porter, who was a very St Anthony in his pious resolution. 'What you ask is impossible.'

At this juncture the Superior, who was a tender-hearted man, put his head out of his window, and desired to know what all the talking was about; and when he heard the case stated, he decided that the girl should be admitted. 'And as,' said the good man, 'I cannot send her into any of your cells, my brothers, she is welcome to pass the night in mine, sitting in this arm-chair, wrapped up as she is, in that thick cloak.' This was the very thing the countryman wished; so he agreed with alacrity; and the Superior took him into his cell, and shewed him the chair in which he was to sit. And there to be sure he sat the long night through, as quiet as a mouse, while the Superior slept the sleep of the just, undisturbed by dreams of the pig so fraudulently obtained; when all of a sudden as morning began to dawn, out came a thick stick, and up got the countryman from the chair, and whack! whack! went the stick on the Superior's back to the tune of 'So I don't know a pig from an ass, don't I!'

The monks were sound sleepers, and by the time the fraternity were roused, the Superior had got a very sound drubbing indeed; and the countryman was off and away without any one having so much as seen him.

Next day he dressed himself up as a doctor, and came round to the monastery, asking if there was any one ailing, to the great joy of the monks, who compassionated the Father Superior's hard case, but did not like to send for the doctor of the neighbourhood, lest it should occasion a scandal. This itinerant physician was accordingly received with open arms, and conducted to the Superior's cell, where, shaking his head gravely, he declared that a certain herb was necessary to his cure. The herb was a rare one, and the whole community to a man turned out to seek it, and dispersed themselves over the Campagna in quest of it, leaving the pretended doctor and the Father Superior alone, when, sad to tell, out came the stick again, and whack! whack! it went to the same tune as before, till the poor Superior, beaten within an inch of his life, yelled so horribly that his piteous cries reached his brethren far out on the Campagna. In hot haste they returned, but too late to catch the doctor; he was gone. The chastisement, however, which he had bestowed had not been without its effects. 'We have sinned, my brethren,' groaned the Superior, as they clustered round his

bed ; and he forthwith decreed that the man's pig should be restored to him, and an ass added to it.

This is a fair sample of many of these stories, which deal with subjects ecclesiastical, and have priests or monks for their heroes. Another and equally numerous class deals in jokes about domestic disputes. One of these, 'The Bad-tempered Queen,' smacks of Shakspeare's play, *The Taming of the Shrew*. There was once a queen, perhaps there have been many, whose temper made her vicinity anything but a heaven upon earth. She was young and beautiful and rich, but for obvious reasons was very unwilling to marry. She did not wish a master—not she ; but her subjects made such a fuss about the matter that she was forced to give way to them at last, when she chose for her husband, not a king, but a certain duke, who never opened his lips, and whom she therefore concluded to be an easy-going, manageable sort of man. The marriage fairly over, Her Majesty set about making her arrangements just as before, and issued invitations for a great ball, without even so much as consulting His Majesty, whom she quite intended to be, as the ancient Franks would have put it, *Le roi fainéant*.

To all this the husband as usual said not a word ; but a few hours before the banquet he called out to her : 'Put on your travelling dress as quickly as possible ; the carriage will be round immediately.'

Whereupon Her Majesty with much scorn declared she would do no such thing ; she had to choose her evening dress for the banquet.

'If you are not ready in five minutes, when the carriage comes round, it will be the worse for you,' said Monsieur the husband.

'How can I go to the country,' complained the wife, 'when I have invited half the world to a ball ?'

'I have invited no one,' said the quiet man, as quietly as ever. 'And now, don't stand hesitating when I give an order ; go and get ready immediately.'

Her Majesty was in half-a-dozen of minds about it ; but she ended at last by obeying ; and five minutes after the carriage came round, she appeared also, in travelling costume.

'You have kept me waiting,' he said ; 'but I will say nothing about it this time. If it occurs again you will be sorry for it.'

As may be supposed, they did not set off on the best of terms with each other ; and to shew how much she was offended with him, the queen took no notice of him all the way, but fondled a little dog which she held on her knee, and talked to it, all the time.

'Jump on my lap,' said the husband, watching an opportunity when she was silent.

'He will not obey you,' said the wife, contemptuously ; 'he is mine.'

'I keep no one about me,' said the husband, as quietly as ever, 'who does not obey me.' And he took out his pistol and shot the dog dead, which produced such an effect upon the queen that she did not even venture to complain. Very soon after, they arrived at their journey's end ; and as the queen was proceeding to her apartment, her husband called her to him, and bade her take off his boots. She was about to refuse, but thought better of it, and complied. 'Now,' he said, 'sit down in this arm-chair, and I will take off yours ; for my theory of the marriage state is that husband

and wife should be mutually helpful to each other.' And with this sound moral, we take our leave of Miss Busk's very interesting collection of Roman folk-lore.

FALLEN FORTUNES.

CHAPTER XLVI.—IN BRAZIL.

'To come on deck and look at it,' is not quite the professional phrase for sighting land and deciding upon its bearings. But the fact was, that *except* Dalton, there had probably not been a man on board the *Flamborough Ideal* who knew less about nautical matters than Philip Astor. These two men were in fact the very last that a ship's captain would have selected to help him to navigate a vessel ; and almost the last whom any one would have chosen as coadjutors in such an adventure as lay before them. Dalton was a product of the highest civilisation, if not of culture. His natural place was in drawing-rooms and club-houses : he had never done anything of a menial, or indeed a useful kind since he had been a fug at Eton, and was 'blown up' (and worse), like another King Alfred, for burning his master's toast. The idea of his being shipwrecked on a desolate island was preposterous, and would have placed the stern Fate that brought him there among the first class of humorists.

Philip Astor had, it is true, been more knocked about in the world ; but the shifts and contrivances to which he had been pushed had been those of town-life ; he knew scarcely more of what may be called the rudiments of life—how to build, to cook, to clothe himself, even to guess the time by the position of the sun—than his more highly placed half-brother. At present, however, he had much the advantage over him in health and vigour ; and he now put forth his strength to the uttermost to carry his companion through the slush of the saloon and to assist him up the now sidelong staircase to the deck.

Dalton was better, however ; he got along with much less difficulty than he had expected, and the fresh air revived him wonderfully. The prospect itself was not exhilarating ; the storm had ceased, but left the sea of a dull leaden colour, as though its liver (as must certainly have been the case if it had one) had been much 'upset.' The ship it was a compliment to call a ship at all. The masts were gone, though the stumps were left, and one of the steam-funnels ; some broken rigging was trailing in the water, which was level with the bulwarks on one side, while the other was lifted up, and to a landsman's eye threatened an overturn every moment. To stand upon the sloping deck without holding on to some fixed object, was impossible. Still the vessel moved, though very slowly, and fortunately in the direction favourable to the voyagers' hopes.

In front of them lay a low, scantily wooded island, with sandy shore, and to this they were tending, though not in a straight course. The wind was

slight, and from the north-east, and bore them towards a rocky promontory to the south of the island, which formed one side of a little bay. If the ship should drive ashore inside this promontory, matters might go well; but if outside, there was the open sea again, where the question of her remaining afloat could be only one of a few hours at furthest. The helm, even if she had a rudder—which was more than doubtful—was gone, and the two men watched the course of the vessel in utter helplessness.

Suddenly the wind shifted a little, and turned the ship's head more to the south-east; that is, to seaward. It was now obvious that she was about to miss the promontory. The two men looked at one another in silent despair.

Then suddenly Dalton cried: 'Can you find a hatchet, Philip?'

Fortunately, in a corner of the deck there was one—the last left of many that had been used to cut away the ship's gear on that terrible day.

'If we can get rid of that rigging, perhaps she will wear a bit.'

A few powerful strokes from Philip's arm freed the ship from this encumbrance, and at once she rose a little in the water, and altered her course as was desired.

It was not just then a time for compliments, but afterwards Philip told John that from that moment he was reconciled to the idea of his (John's) having succeeded to the Dalton property; for that a man with such intelligence deserved to be the head of the family. Thus the dismayed ship, though rolling and swaying, yet floated into what, by comparison with where she had been, might be called port; that is to say, under the sheltered side of the promontory, close to which, and in almost shallow water, she grounded upon the sand, as safe (while the weather continued fine) as though she were in the London Docks.

Of this much in respect of their common adventures both John and Philip often spoke; but with regard to their subsequent life upon the spot they had thus had the good fortune to reach, these twin Crusoes were very reticent. The fact was that from their excessive ignorance, they got on worse than almost any persons in such a situation could have been expected to do. The island, a small one, lying to the south of the West India group, and little else than barren rock, could certainly not have sustained them had they been dependent upon the development or even the realisation of its resources. But fortunately for them, the sea had not robbed the *Flamborough Head* of its contents, although it had damaged much of them excessively. They lost no time in removing all the stores they could lay their hands on to land, and took up their abode in a cave upon the promontory, on which they erected a flag, to call the attention of any passing ship. They had to thank the island for nothing save indeed for a limpid spring, without which it might have gone hard with them, neither of them possessing that kind of genius that hits upon scientific plans of extracting fresh water from plants, precious stones, or even from salt water.

Before they got to the end of their preserved meats and vegetables, their 'extracts' of this and that, and their ship-biscuits, a Spanish vessel, bound for Rio, passed by, and seeing their signal, sent a

boat, and brought them off. They came away in very good case, and almost fit to be Fellows of All Souls, *bene nati* (though one of them it is true the law held to be illegitimate), *bene vestiti* (for they had had all their fellow-passengers' clothes to choose from, beside their own), *et mediocriter docti*; that is to say, they were almost as ignorant of how to provide for themselves as when they landed. Yet they had learned something: to respect one another very heartily, and also—this was especially the case with John—to look upon life otherwise than through the tinted spectacles of society. He had had cause to recognise very literally 'a man and a brother' in his unacknowledged kinsman, to whom he owed his life twice and thrice over. If Philip had not remained with him on board ship, he would have perished in his narrow cabin, or certainly have never reached land; and if he had reached land, he would have perished there, but for Philip's companionship, cheerfulness, and sympathy. Even as it was, he had been consumed with apprehensions about those dear ones he had left at Sanbeck, and only too truly, as we know, had his heart mis-given him respecting Edith, overwhelmed as she must needs be by this time with the news of the loss of the *Flamborough Head*. His dead wife, his orphaned children, were spectacles that were rarely absent from his eyes, and he needed all Philip's sanguine arguments and pleasant prophecies to win him from deep despondency. For the rest, his out-of-door life and simple fare had physically bettered him; he had got rid of his lameness, and felt himself strong enough for any hardships that might yet lie before him in his quest. Upon visiting San José, and seeing with his own eyes how matters were with the gold mine, his mind was as fixed as ever: much as he yearned for home, he was resolved not to return thither with the mission unaccomplished for which he had left it; and the opportunity was now—at last—afforded him of effecting his object. The two castaways had a sufficient stock remaining of the good things saved from the *Flamborough Head* to make them very welcome on board the *Cádiz* without the payment of passage-money; so Dalton's slender purse was still intact upon their arrival at Rio.

Here, however, misfortune was awaiting him; a letter that had long been lying for him at the post-office informed him of his wife's death. His forebodings, as we know, had pointed that way with an inexorable finger, but they had not prepared him for it, and for a time the news utterly overwhelmed him. To say that Edith had been his better-half, his *alter ego*, and the good angel of his life, so far as he had permitted her to be so, was feebly indeed to express what she had been to him; and with his anguish there was mingled the most bitter remorse; for had he not killed her with the work of his own hands? Out of the very depths of his wretchedness, however, came a motive for action: all the reparation he could now make to his lost love and lover was to further the interests of her children. Whether they were still left to him, or in what plight, he could not tell, nor had he the means of informing them that they had yet a father, since, unhappily, the mail-boat had left Rio the very day before his arrival.

There was time to reach San José and return before the next steamer left the port for England; so the two brothers at once started for their destination. They had to husband their resources, and

travelled slowly, and with what, six months ago, Dalton would have felt to be great discomfort, much increased by their ignorance of Spanish, or the native tongue. And even when they reached San José, they found they had by no means accomplished their journey. The *Lara* mine, about which people seemed to know little or nothing, was still far away, and since it lay out of the main track, they were compelled to push thither on foot.

The scenery was splendid: they were always in sight of the stupendous Cordilleras, although they scarcely seemed to approach them nearer. The gold district lay between them and these mountains. In the good old times, the precious metal had been exclusively the produce of alluvial washings; but these had long become exhausted, and the gold now yielded was dug deep out of the solid rock, which cropped up on the surface in dome-like masses, often covered with foliage. If Dalton's mind had not been bent so earnestly on a single end, he could not but have been enchanted with these scenes, in which men contend so energetically with Nature, and yet could not mar her beauties. The two friends had passed by three such mines, and on the third morning of their travels came upon a fourth. They asked its name of one they met upon the road who knew a little English, and he had told them it was called the *Quito*. It was situated in the most beautiful spot they had yet reached.

'Forest on forest' hung above it 'like cloud on cloud,' so that, though itself in an elevated region, it looked sunk in a shady vale. A little river ran through it, which turned the stamping-mills and the pumping-machinery, which was in full action. The din was incessant, yet by no means deafening; and the bustle and movement, contrasted with the quietness and sublimity of its natural surroundings, were very striking. The chief engineer—who was one Mr Blake, as usual an Englishman—gave a welcome to his two wandering fellow-countrymen that was more than cordial; there being no inn in the place, he invited them to dine, and after that repast, shewed them over the works, which were of considerable extent. Not content with watching the tram-carriages, bearing each a ton of the mineral, coming steeply up from the shafts, they descended in them to the depth of nearly a thousand feet, to the very home of the gold. Afterwards they had explained to them how the rough rock gives forth its treasure; saw it freed from slate upon the spalling floors, and afterwards, stamped fine, issuing through the copper grates, to pass over the bullock skins, and—lower down the inclined tables—over woollen cloths, the washing of which yields the golden fruitage. Then they once more repaired to Mr Blake's one-storied dwelling, tiled and slated, with its broad veranda hung with flowers and creepers, to be again refreshed before they started on their way. With pardonable pride, he spoke of the *Quito's* prosperity, which he said was but of recent date. He had been its engineer but for a few months, and had taken it when it was in a very depressed condition. There had been even a doubt as to whether it would repay working at all, all its ancient wealth having been supposed to be exhausted.

His wife, also English, listened to the story of his achievement as though she had heard no word of it before.

'Your friend has suffered a recent loss, I fear?' observed the engineer apart to Philip, for Dalton

was in deep mourning; and the spectacle of the domestic happiness of his host and hostess, and of their prosperity, touched his bruised heart with a sense of contrast.

'Yes,' returned Philip; 'losses of all kinds. His wife is dead, and his fortune has been spent in the same sort of adventure that has turned out so differently in your case.'

'Indeed. I am sorry for it. The fact is, only about one in six of these Brazil mines, formerly so profitable, now pay their expenses. There is also a deal of roguery about some of them, very difficult for those who are not upon the spot—I mean for English shareholders—to get to the bottom of. I am afraid some of my own calling—who are my fellow-countrymen, like yourselves—do not always keep their hands clean. The agents, the experts, and the engineers have it all their own way, you see, out here.'

'Just so. Well, we are now bound for my friend's mine; just such a one as you have described, I fear; the *Lara*, and if you can tell us anything about it, he will be greatly indebted to you.'

'The *Lara*?' echoed the engineer. 'Are you really serious? Did you come from England to look after the *Lara*?'

'Yes; though, I am afraid, upon a fool's errand. The people at Rio and those we have met upon the road seemed to know little or nothing about it.'

'Are you talking about the *Lara*?' here put in Dalton earnestly. 'Can our host tell us anything about it, Philip?—Pray, don't fear to tell me the worst, Mr Blake,' added he, addressing his host.

'I don't know what you mean by "the worst," Mr Dalton,' returned the engineer curtly; 'but I have only to say that this mine here is the *Lara*. It has only been called the *Quito* for the last six months.'

CHAPTER XLVII.—MINE AND COUNTER-MINE.

Mr Blake's astounding announcement was of course a revelation to his two guests, but they had the prudence to conceal it as best they could. The engineer was a thoroughly honourable fellow, and consequently loyal to his employers. It would have been difficult to convince him—and on the whole Dalton thought it better not to try—that the mine with the conduct of which he had been intrusted—and here again Holt had shewn his peculiar idiosyncrasy in favour of honesty in other people—was in fact a swindle of the most Machiavelian kind. Instead of existing on paper only, like other fraudulent institutions of a similar class, it did *not* exist on paper—that is, under its real name—at all, but had a very actual and *bond fide* existence in fact. The last local agent of the *Lara*, Brooks, had been in the pay of Holt, and had played into the hands of his creature Tobbit, the expert, in representing the mine to the English shareholders as worked out and valueless. The whole affair had been transacted with consummate skill, but not, as we have seen, without exciting the suspicions of Philip Astor, and even of a certain financial circle in the City with which Sir Richard Beevor and Mr Binks were connected. Up to this time, however, the real state of things was undiscovered, and for the present, Dalton thought it better it should remain so. Of the proofs of it he presently acquired full possession, but in dealing with so astute a scoundrel as Holt it was expedient to be very cautious; while so long

as the latter was kept in ignorance of Philip and himself having been saved from the *Flamborough Head*, they would have a great advantage over him.

Dalton therefore confined the statement of his wrongs to the fact, that endeavours had been made to persuade him to part with certain shares in the *Lara*, as being of no value. His account of the affair was not indeed very intelligible; and Philip had to lend assistance by hinting that his brother's grievance had—as grievances are apt to do—not left him altogether a logical being upon this particular topic; but the pair so far succeeded, that when they quitted Mr Blake's hospitable roof, that gentleman had no suspicion that he had been entertaining an angel unawares in the person of one of his proprietors; while on the other hand it was pretty evident to Dalton that the only individual who held any shares in the *Lara* beside himself was in truth Richard Holt, who held half of them, and had certainly left no stone unturned to secure the other moiety; while in the meantime, as though already possessed of it, he had been receiving the proceeds of the whole, which made up a very substantial income.

'But for your "*Stick to the Lara*," Philip,' said John with grateful frankness, 'I believe I should have let the scoundrel buy my shares of me for a song.'

'Nay, brother, it was not much to do—the writing those four words; but I hope you will stick to me, in recollection of them,' answered Philip. The words were said in jest, but the tone had a serious sadness in it, which stung the other to the quick.

'Do you doubt it, Philip?' said he. 'Do you conceive it possible, that when I have grown rich again—"assumed my former social position," as Mrs Campden called it (I wonder how that woman is behaving to my poor children; however, George will keep her straight), that I shall inherit with it my former follies? that I shall not know my true friends, those who have been tried in the fire—and the water—from the false ones, and above all, shall not cleave to the brother to whom I shall owe all?'

'We shall be quits,' said Astor, pressing his hand, 'and more than quits, when you introduce me to Kitty as "Uncle Philip."'

'Then I hope we shall be quits within the next six weeks,' was John's reply.

They returned to Rio, however, only just in time to catch the steamer *Sancho*, the fore-cabin fare of which almost exhausted their finances. The ship was a slow one compared with the *Flamborough Head*, and Dalton was in such a state of impatience and anxiety throughout the voyage, that Philip feared he would have had a fever. A thousand apprehensions consumed him, and as many hopes: among the former was the dread that some news of their having been rescued by the Spanish vessel should somehow reach England before them, and set Holt upon his guard.

From Liverpool they came straight to town, yet not without some vague tidings of passengers having been picked up from the *Flamborough Head* preceding them, as we have seen, to London. So much, indeed, Holt's Liverpool agent had telegraphed to him as took him thither in hot haste to learn the truth. John and Philip had, however, taken the precaution to enter themselves on board

the *Sancho* under false names; nor was it likely that they two of all that sailed in the ill-fated steamer should have come home to blast his fortunes.

RAILWAY TICKETS.

WITHIN living memory railroads were worked without tickets. In the infancy of steam-traffic, passengers paid their fares to the clerk and walked upon the station platform with their friends until the train arrived, were then conveyed to their destinations, and left the railway without giving any proof to the officials of the station where they disembarked that they had paid their fare at the point of departure. There was therefore no check upon the clerk who received the money, and none also upon the passengers—a state of things, both with regard to society and also with regard to the size of the railway traffic, very different from what it is now.

It is now some forty years since railway tickets were printed and issued. The originator of the idea was a man who was employed at a little wayside station in the neighbourhood of Carlisle, and those he then used were about the same size as the tickets now issued. But his arrangements for printing them were of the most primitive description. In fact, a few types fastened together in a case about the size of a nail-brush formed his sole apparatus. The name of the station to which the passenger was going was written upon the ticket at the time of issue. We can realise to ourselves how this system would work now: say at Clapham Junction or at the Underground stations! But this system, primitive as it was, grew and flourished and became the parent of the present one. The use of tickets on this principle gradually increased, until at last its inventor found that it would be desirable to devote himself entirely to the development of the new industry. From that day to this the printing of railway tickets has remained in the hands of the same family, who have pursued it with an amount of perseverance and ingenuity perfectly marvellous. The railways of nearly the whole world are supplied with tickets from the one manufactory. There may be seen in course of manufacture tickets for English railways, Swedish, South American, Egyptian, &c. We saw there on one occasion Cairo tickets—a special class—for 'pilgrims going to Mecca'; and others for a fourth class, specially printed for a South American line, for 'slaves without shoes and stockings.'

The first great improvement made in the tickets was in numbering them. This was an enormous stride in advance of the old tickets. Every railway passenger has noticed that each ticket is numbered, and many people imagine that that number is printed by the little press in front of the ticket-clerk when he thrusts the ticket in before it is issued. But the duty of that press is in reality to print the date—the numbering being done before the ticket arrives at the station. A large proportion of the accuracy of the accounts of railways depends upon these numbers. For example, take the case of a booking-clerk at Reading. He has before him a box with a large number of pigeon-holes, each holding the tickets for one station. Let us select the pigeon-hole for Salisbury. Before he begins his day's work, he knows that the

first ticket from Reading to Salisbury will be say 5026. When his day's work is over, he finds that the last ticket issued is say 5056. He has therefore issued thirty tickets of this particular class to Salisbury, and is responsible for thirty fares. He has a return to fill up each day of the numbers on the tickets issued; and by seeing that the last number on each day and the first of the next are consecutive, the officials at headquarters are able to have a complete check upon the station-clerks, and to preserve an almost invariable accuracy in their accounts.

Let us see how this ticket-printing is done. First of all, here are boxes filled with coloured pieces of cardboard, which will soon be printed and made into tickets. An order has come from the South-western Railway for so many thousand tickets from say Waterloo to Bishopstoke. The order states colour or colours, the number of the last ticket in stock, and the average consumption, which enables the printer to know when the tickets ordered must be sent in.

The little steam-wrought machine for printing railway tickets is an exceedingly ingenious piece of mechanism. Imagine a table about twice the size of a page of this magazine with a long thin box rising above it at the back, and another box falling below it at the front. The table contains the printing-rollers and type-case; the boxes (the interior horizontal section of which is the size of a ticket) are for holding tickets. The upper box is filled with a pile of pieces of cardboard. One at a time, the lowest card is jerked by a spring under the printing-machinery and falls into the lower box; and in less than a quarter of a second it is printed and numbered and safely stored in the other box. All that the man has to do is to keep the upper box filled with cards, remove the lower box when filled, supply fresh empty boxes, place the printed tickets in rows, and see that the ink reservoir is full. The machine does the rest, including the printing, the inking of the type, and the moving and storing of the tickets.

The numbering is done by means of four wheels, with their centres in a horizontal line—thus forming a cylinder. These wheels have raised numerals on their edges, which imprint themselves on the tickets. The wheel which bears the numeral in the units place, moves so that a fresh type is ready for each successive ticket; that in the tens place, at one tenth that rate, and so on.

The next step of counting the tickets is a curious one. Though the greatest care is taken to insure accuracy, mistakes *will* occur in printing the numbers on the tickets. Sometimes a number is omitted; sometimes two tickets are printed with the same number. To provide against such casualties the tickets when printed are counted; and as it is impossible for human eye and memory and judgment to be infallible, they are counted by machinery. This machinery again consists of a table with the two boxes as before. This time the table is simply a table with a hole in it large enough to allow the number of a ticket to be seen through. At the side of the table is a cylinder wheel similar to that above described. The number on the cylinder is adjusted to be the same as that printed on the first ticket to be counted. The tickets are in consecutive order. As the boy turns a handle, they are

jerked from the upper box to the lower, shewing their numbers under the hole. The cylinder wheel revolves at the same rate, and therefore the number on each ticket and that on the wheel ought to agree. If they do not agree, then it is evident that a number has been omitted or perhaps duplicated. The deficient ticket being supplied or the surplus one removed, the tickets are then pressed together by machinery, tied, packed, and sent to their destinations.

Such is one of the interesting industries of our time; an industry invented, developed, and still in the hands of one family; yet spread in its interests over the whole world. And it is curious to know that in one long low building in a suburban street of a provincial town, the tickets for the whole world, except North America, are made.

FOLLOWING UP THE TRACK.

CHAPTER VII.

SEVERAL months had passed and gone since the fair of Mulla and the interview with Mary Dwyer; and winter was reluctantly giving way to spring, releasing plant and tree, and that tiny herald of opening vegetation the snowdrop, from the torpor of forgetfulness. But to the houseless widower the blessed influence of the season, and the sources of enjoyment it supplied, were strangers, and more rigid grew the lines and furrows in his face, more rapid his uncertain steps, as with scanty means now fast failing (for the fever of his mind would not admit of the quiet monotony of unthinking labour), he still pursued his inquiries as to what had become of the absent John Dwyer; for with the belief in destiny, the fatalism so often found in the Irish race, and more akin to Grecian or Oriental superstition than to the purity of a higher faith, he felt assured that the discovery of the hiding-place of Mary's lover would in some unexplained way unravel a secret which was baffling the course of justice. Some strange attraction still kept him lingering around the cottage and the Glen or its neighbourhood, although another had become the tenant of the farm; and many were the hours spent in the wood that shaded the entrance to the breen, while sometimes he would sum up resolution to open the gate of the bawn itself; but then when one of the little children about the place, or the girl driving home the cows at milking-time, disturbed his dreams of the past, he would mutter a brief answer to their kindly salutation, and speeding away, in solitude give way to the passion of his soul.

It was on one of these occasions, when he had fled from voices which in other days would have come as music to his heart—voices reminding him as they did of the infant prattle of Ellen's first-born, he sped away from the Glen; the sky suddenly became overcast, clouds gathered with the rapidity only known in mountain districts, and amid the roll of thunder and the lightning gleams, the rain, ploughing up each faint track across the heather made the mere rivulet a formidable torrent. Maurice Power turned abruptly from the open track which he had been following for a considerable time, and descending by means of twisted and gnarled branches the face of a steep rock, only

separated from the regular high-road by a swamp or bottom lands which in the height of summer were the favourite feeding-ground of cattle, pushed aside a mass of clustering furze and thorn-bushes, and bending low found himself at the entrance of a cave. No mere chance would have made him discover the recess in the rock so elaborately concealed by nature. It had been formerly used as a secure depository by the members of a family in the locality, for the malt and the still used in the manufacture of poteen, until in a fit of anger at the refusal of her father to allow her to marry a worthless idler, the daughter of Terence Rourke betrayed his illicit operations to the gaugers; saw him sent to a prison, where he died; obtained for herself the reward payable to the informer, and with the proceeds married the man who was everything to her. Truly has it been said that even if our first parents had been permitted after the Fall to continue in the Garden of Eden, the memory of the loss of their innocence would have for them robbed it of all its beauty and attraction; and but a few years had gone past when to the wretched girl the reality of her changed state was made manifest. The ruined father was sleeping in the quiet churchyard, which could be almost seen from the door of her once comfortable homestead; and the dislike of the peasantry and neighbours—whose innate horror of the character of an informer the philosophy of Locke could scarcely controvert—was intensified by the affinity between the betrayer and the betrayed. They shrunk from the tainted recipient of the money of King George; and even in the chapel, should the bending form of Alice Ryan be seen in the most retired part of the edifice, a cordon was sure to be drawn around her, within which no one would venture to pass; and the venerable and kindly priest, although he would reprove his flock for this conduct, and remind them how his Great Master chid those who murmured when He bid the erring woman depart with the gentle admonition, 'Go and sin no more,' could not on such occasions speak with his wonted frankness and sincerity; and the uttered censure to his flock was in antagonism to the affectionate looks with which his words were accompanied.

The miserable girl, now a parent herself, like too many others sought to forget her degradation in drink; but even that source was dried up when the last shilling of the 'reward' was spent; and it was a relief to her husband and the neighbourhood, when at length her staggering steps, tracked from the hovel in which she burrowed like some animal, were found to end at the verge of one of the rushy pools near the cave. There were found some deeper tracks than those a woman's foot could make, but they assumed no defined form, for it was manifest that they must have been carefully confused, perhaps on the next early dawn; but whatever might be the solution of a mystery which the veil of time would not allow to be uplifted, superstition cast its spell around the place, and none of those who were acquainted with the secret position of the cave dared ever afterwards to venture within it, even in the open day.

There was a peculiarity in the atmosphere of the retreat which, while it had been the depot for the malt, corn, and other stores for the manufacture of whisky, was of great advantage by its property of arresting decay to a marvellous extent.

Its present casual visitor, with the restlessness so often the characteristic of the unhappy, paced up and down the rough ground; and after a little time, as he went further away from the opening, his foot struck against some heavy substance, and his eyes fell upon the features of a man whom death must have surprised in some terrible interval of pain. Life must have passed away in the spring-time of youth; and as Maurice Power made closer examination, he shuddered involuntarily at the recollection of past events. The first gleams of pity were succeeded by vengeful looks, and finally by one of satisfaction, as he involuntarily exclaimed: 'This must have been one of them, and here is the proof of the blow I struck that same night. You must have been that John Dwyer who was led away to join with villains far worse than yourself. Did no mother hug you to her breast when a little child, and teach you to stammer out the first plain words of kindness? And when you grew up to be strong like myself, what brought the thirst of money into your heart, that you should break into my little abode by night? Was there no spot to be made desolate but mine—no fire to be quenched but that which was upon my hearth? The river runs as brightly in the valley as when first beside the stepping-stones I told my darling how I loved her, and with trembling hands and tears that could not be hidden, she made answer to my prayer! The trees in the Glen whisper their songs as sweetly as they ever did when I walked and discoursed with her under their shade; and there is no change but in myself, and in you indeed, poor, wicked, weak fool.' As these last words were uttered, Maurice Power appeared as if he would have struck with his foot the prostrate heap before him, but restrained the impulse which suggested the action. 'No,' was the observation; 'I never in fight hit my worst enemy when he was on the ground; and death has made this poor clay as holy as if it was laid upon an altar, great though the wrong was. But as for those who led you on, and were so much worse than yourself, they won't long escape me now. I am certain I have come upon their track at last; and as sure as innocent blood won't sink into the ground, unless to bring up the harvest which the guilty must reap, so sure will right be done.' As he laid this assurance to heart, he carefully removed the body from the open space to which it had been drawn, concealed it with leaves and bushes, and then hurried from the spot, walking in the direction of the village of Mulla, but first carefully putting into his pocket something which even for him seemed to possess considerable attraction.

When the outcast farmer on the next morning entered the dwelling-house of Mrs Dwyer, the accustomed 'God save all here,' addressed to the widow and her daughter, was spoken in an awkward and hesitating manner, and it was manifest that he came upon some unpleasant mission. 'Good-morrow, kindly,' was the genial response. 'But the Lord come betwixt us and harm! what is the matter with you?' interrogated the hostess. 'One would think you had seen a ghost; or might it be that you have some bad news you are afraid to tell, for your face now reminds me of Terence Murray's when he rushed in to say his barn was burned down and all the crops he had on the farm, and that he and his motherless children

must take to the roadside and beg for their bit and sup, instead of being able to honestly induster as before.'

'It is true for you; I am almost sure I have the bad news, and more's the pity.'

'Could it be anything about John?' murmured the girl to her mother, while the mantling colour played for an instant over her countenance, and then left it pallid in hue.

'The fond heart and the young love are never mistaken, and it is indeed of him I come to make mention. I am certain I have found out what happened to him.'

'Oh, what has happened to him? where is he?'—two anxious excited voices exclaimed in the same breath.

'He is beyond the reach of any friend, or the influence of any bad companions. He is dead, and nothing now left to him but the decency of a Christian burial.'

There was an agonising shriek, the falling of a fragile form upon the earthen floor; and after some minutes, suppressed sobs and the more vehement wailing of the widow broke the painful silence.

The bearer of the ill news remained motionless, and let the tide of emotion run its inevitable course without any attempt at consolation, or even the expression of any sympathy, for he knew how idle it was to attempt to check its progress in its first plenitude and power; but when an hour had gone past, taking the daughter by the hand, he said to her gently, but yet firmly: 'I must speak with you, and alone;' and taking her by the hand, he proceeded with her to the haggard.

'Now that no one hears us, I believe, as sure as there is justice in heaven, and One who will bring bad deeds to the light, that it was while in the company of that Brien Spelassy and some strange man, your cousin came by his end.'

'Oh, do you think that they fell out with the poor boy, and afterwards killed him?'

'Not exactly that, but they were in a way his murderers; for had not the villains tempted him, he would still have been to the fore. And you who have met with the first big grief of your young life, will you not promise me—by your father who has gone before you, and by the tenderness you bear to your mother, no matter what you may hear from this time out, ay, even as to myself; and no matter what you may discover as to any person who may, without knowing it, have done you a great wrong, help me to drag to justice those who were the means of bringing shame and disgrace upon a decent name? Refuse what I ask, and give me the cold answer, and then none shall know where he lies unburied, no churchyard be his sleeping-place.'

Mary Dwyer paused a while, as if there was something to be involved in the promise which would hereafter call for some great sacrifice on her part, and she replied: 'Leave them to Him and their consciences, and when their own hour has come, they will feel how great is the wrong they have done you and me. Sorrow one of us is without our own sins to give an account of, and life enough has been taken without the law going to take more.'

'If it wasn't that you are a woman, I might call you a *natural* without courage or heart. Do you think that bloodhounds, once they have torn a lamb to pieces, will stop and destroy no more

lambs? or that the fellow who has done his worst, and betrayed one of your kind, will sit down and pray that he may live a better life for the time to come? No; you will be a sharer in their crimes if you don't help to put a stop to them. It was only yesterday I was passing along a fair green where there was a show going on, and a crowd of children were looking at what they call a tiger in his cage. If I had opened the door and let him out to work his will upon them, which of the two of us would have been the greater brute?'

There are persons who 'will,' and there are individuals who only 'wish;' and to the former no obstacles avail to put a limit to their power. To them 'impossible' is a term not known in their vocabulary, and all intervening obstacles are overleaped with marvellous facility. Maurice Power belonged to the former class, now that the pursuit of vengeance had transformed the mere peasant into the avenger.

'As I loved my cousin in life,' said the girl, let my prayers go with his body to the grave. I do not care to hurt any one he ever knew or cared to have as a companion; but you put things before me in a way I would never have seen; so if ever it comes before a judge or jury, all I know or heard tell of this same Spelassy they shall hear from my lips.'

The man had so far gained his end. He could not but feel he had been disingenuous in concealing as yet the fact that it was his hand which took away the life of John Dwyer, but he knew that this disclosure must come in due time; but if made at once it would for ever silence the girl, whose testimony might become of great value. The interview was closed after the promise had been given, and they parted at the gate of the haggard, for Maurice feared that if he remained longer, some change might come over the hesitating resolve of the girl, or that she might declare she would not act otherwise than as her mother should counsel.

Great was the excitement in the district when the body of John Dwyer was removed to the barrack-yard, in order that an inquest should be held to inquire under what circumstances it had been found in the cave, and how and when the deadly wound had been inflicted. The inquest was a formal but pretentious one, and like too many inquests, came to nothing, although, as if to prepare the way for the doing of something practical, and prior to the examination of witnesses, an eloquent dissertation was delivered by the coroner on the rights conferred on the subject by Magna Charta. The surgeon made his *post-mortem* examination, as otherwise the authorities would not have been satisfied that life was extinct *secundum artem*; but how the wound was inflicted, and by whom, no one of course could tell; but the jurors looked grave, and with a due sense of what was expected from them, and after some anxious hours they recorded under their hands and seals their verdict, from which, however, one of the twelve dissented, 'Found dead.' And just as the excitement consequent on the official proceedings was fading away, a new source of interest was awakened by the discovery, that at the last great fair of Mulla some cunning forger had been at work, and amid the bundles of notes the farmers brought home in lieu of their herds and pigs, the majority turned out to be worthless but clever

imitations of the authorised bank; but how the counterfeit ones could have been so adroitly substituted for the others was an unexplained fact, and 'Found at fault' was the verdict returned by public opinion.

CHAPTER VIII.

'I wonder when this state of things will have an end?' was the querulous ejaculation of Francis Butler, Esq., the great man of the locality, and one of His Majesty George III.'s justices of the peace in and for the county of Tipperary, as Terence Hayes, his gardener, sat with him in a room off the hall of that gentleman's residence, which was dignified with the imposing title of 'study;' a room in which, however, the only books were those containing the flies meant to seduce trout from the river which flowed at the foot of the lawn; ten or twelve volumes of the *Racing Calendar*; an almanac bound up for facility of reference with some sermons, and a mutilated copy of Hale's *Pleas of the Crown*. There was further a prize-essay on the best way to cure the mange in sheep, and the *Fox-hunter's Guide*. In sooth the study was devoted to the less exacting duties of drinking at ease and in quiet with a select few, including the rector of the parish and the parish priest; for notwithstanding the state ostracism of the latter, prime claret in the wood and potteen in its virgin purity were wonderful solvents of any asperities that in the height of argument might spring up between the professors of the rival churches; and there was not then the social barriers which have been raised up in later years.

'Myself does not know, your Honour; but if the magistrates and the army can't find out what is going on, it is a strange thing. Here was an honest boy kilt and hid in a cave almost forewent the people's doors, without any one knowing by whom it was done; and other thieves of the world putting off their bad notes.'

Just at this period a knock was heard at the hall door; and Mr Butler nearly upsetting the decanter at his elbow, turned to the gardener, and after a little hesitation desired him to go and ascertain who it was that wanted him at such an unreasonable magisterial hour. 'And mind,' he added, 'if the fellow, whoever he is, does not give a good account of himself, ring the bell in the yard, and give the alarm, for no one's house is now safe since what befell the poor young woman and her infant in the Glen.'

The gardener went, and soon returned. 'The man is in the hall, and he bid me tell your Honour that he has most pressing business to do with you as a magistrate, and wants to see you alone.'

'See me alone? Why, positively the fellow must be either tipsy or mad to speak in such a high tone; or possibly he may prove to be something worse; but I must take my chance for that. Bid him come in, and do you remain abroad out of hearing;' for though the Justice was indolent, he had the spirit and high courage of his countrymen, and had only affected to be slightly alarmed in the hope that possibly the intruder, whoever he might be, would perchance be discouraged from troubling him with his affairs.

The stranger entered, and refusing the chair which was courteously handed to him, said: 'I am, sir, Maurice Power, whose misfortunes have made

you and the rest of the country about here know who I am.'

'Indeed, my poor fellow, I have heard of your great trouble, and pity you from my heart.'

'I mean no offence to your Honour, but the time for pity is past with me, and I am beyond it. My only end now is to have the law punish as it ought the villains of the world who did me the wrong which has left me what I am.'

'I regret to hear you give expression to such an unchristian feeling,' observed the magistrate, who, despite some of his pride of office, was a worthy and religious man, who did not nod and slumber in his pew on Sunday without some rays of faith and pure doctrine being conveyed to his mind and conscience by the worthy divine, whom literally, as well as ecclesiastically, 'he sat under,' owing to the proximity of his seat to the pulpit.

'You cannot judge fairly. You have this fine house to live in; you have children, the music of whose little feet going up and down the stairs is to you sweeter than that of all the birds that sing out of the clouds when the sunshine is on the ground and darting along the river, and the flowers are shutting up their sleepy eyelids from the heat. I have neither the one blessing nor the other. You can afford to be patient when there is nothing to try or to trouble you. When your barns are full, you cannot fancy what a famine is to the people in the next parish; when your sheep and cattle are wandering over your rich and grand meadows, and a score or two of lambs just born have come home to you betwixt the night and morning to add to your store, you can preach with a bold and courageous heart about what a little thing ought to make a man contented; but it is the beggar, or he who is the next door to one, who can really know what the beggar wants. I am stripped of everything; and shall those who made me what I am go free and unpunished?'

This pleading of the outcast had some colouring of justification in it, and the earnestness with which it was urged increased its significance. Circumstances appear to alter even the physical aspects of a place; and the rich valley with its clustering trees, and murmuring rivulet at its foot, which only yesterday looked so picturesque and attractive, will to-day wear a dull and gloomy aspect to the man who passes through it to the next town, because he has, after opening his letters, found one which tells him that all the savings of his life have been swept away by the failure of the bank in whose solvency he had trusted so implicitly. What inconsistencies are there even in the most esteemed of men! Milton tried to withhold from a relative a portion of the property to which she was entitled; the philosophic Howard treated his son with a harshness that made his existence miserable; and the wife and children of the poet Hayley, the author of the *Triumphs of Temper*, were driven from his house by his irritable disposition.

As Maurice Power addressed the magistrate, his voice grew nearly inaudible from emotion, and tears trembled on the eyelids, discoloured and red from the want of sleep and the burning passion in his soul; but they were repressed by the energy of his will. He leant his head on the table, and was silent for a time, and then said: 'I am sorry to have been so wild in my way and talk in the presence of one like your Honour; but

you will forgive me, for I am not now, and never can be, what I was when *she* was alive. And now, sir, to the business which brings me here at this hour of the night. I have found out one of the persons who were at the Glen and in my poor house on All-Hallow's Eve.'

'Indeed, my good man! How did you do so, and where is he now?'

'The grass in Mulla churchyard is his covering this night; and although he did me the greatest wrong one could cause another on this side of the grave, yet I pray that his spirit may be one day in heaven, after he has passed through cleansing fires; for he was only a silly young lad after all, and easily led by those who were so much worse themselves.'

'Can you in any way be referring to the John Dwyer whose inquest I read of in the newspapers only the other day, but who, as I saw from anything sworn to there, appears himself to have been the victim of a murderer?'

'Not of a murderer!' exclaimed the farmer. 'It is unknown as yet to the world (and from one poor girl would I wish it to be hidden until the last moment it is possible) that it was by this right hand he met his fate.'

It has been asserted of himself by Lord Nelson that he could not even understand the import of the word 'fear,' and there may be a few who share in such a happy state of ignorance; but it was a very natural precautionary impulse that induced the representative of the law to draw away a little from the speaker who had made him the confidant in so perilous a secret.

'If what you state be not a silly jest, and I see nothing in your manner to make me think so, it ought to be my duty to arrest you on your own confession, however reluctant to take advantage of what a man discloses to me in my own house. But no! Even though the people at the Castle should hear of it, and get me into trouble, I would rather remain plain Frank Butler, with no J.P. at the end of my name, and with my father's honour untouched in the person of his son, than avail myself of your indiscretion. Delay here no longer; fly while there is time; but remember I should I be enabled to trace out your guilt by any other lips than your own, no one will more strictly do his duty than I shall.'

The humbler classes of the Irish appreciate keenly sympathy or generous conduct from those above them. They who are in an inferior sphere can alone enter thoroughly into the feelings of individuals who are engaged in the same struggle with themselves for existence—struggles to provide food when days of sickness or want of employment have arrived; when the fond father shrinks from the voice of the wife because its melody is gone, and its once buoyant notes have been toned down by the monotony of suffering; when the lisping words of even his last-born become distasteful, because another mouth has to be fed, and appetite actually *damped* down in order to meet a horrible necessity. Revelations of wondrous humanity incidentally crop up, even in parliamentary blue-books, and the poor cabin occupant, it is recorded, speaks thus: 'Many give but can ill afford it, but God gives it back to them.' 'It is true that the beggar may be more certain of his next meal than one of ourselves, but we would think it a sin to refuse him.' (I know persons who would be

glad to have beggars in their houses every evening, for they conceive they carry a blessing with them.) It is not, however, the absence of kindly feeling, but the want of personal knowledge, which serves to interpose a social Sahara between the two great classes of society. Swift, the mere dependant, would possibly have done all in his power to soothe and comfort Betty the housemaid in the household of his employer, Sir William Temple; but as the Dean of St Patrick's, the confidential adviser of the prime-minister Harley and my Lord Bolingbroke, and setting at defiance the resentment of the Duchess of Somerset the favourite of a queen, he would have felt no more compassion for Betty, if dismissed from her situation, than had she been a mummified menial in the establishment of Cheops.

'I thank you, sir, indeed I do!' said Maurice Power; 'but instead of hiding from the law, I am asking for its help through you; and now let me tell your Honour all I have to say.'

Taking a seat which was pointed out to him, he then proceeded, but often pausing, to detail the various circumstances connected with the attack on the cottage, the departure of the assassins, and the discovery of the body of John Dwyer in the cave. 'And now, your Honour, having told you all I know or have found out, I want to swear my information before you, and to get Brien Spelassy arrested, who is in the employ of Mr Stephen Mengher, the bill-discounter and publican. I can swear beyond all that any counsellor might try to make out to the contrary, that it was Spelassy's voice I heard speaking a word or two outside my door on that terrible night; and it was only two days before that he came to Mulla, and in the evening left the widow Dwyer's house in company with John Dwyer her nephew. Mary, the daughter, can prove their long whispering together, then their going away; and more-betoken, she noticed a pistol under Spelassy's coat as he was lifting the latch; and sure they hid him in the cave, and carried him there, for fear if he was found at the place of his misdeeds, all would come out and be known for certain.'

Mr Butler looked puzzled—saw that there was something to decide upon which would possibly require active exertion on his part, but did not know what that something should be, but eventually arrived at the conclusion as to what steps not to take. 'You deceive yourself,' he said, 'if you think you have anything like a sufficient case against this Spelassy which could justify me in giving any orders for his arrest. As to a man's voice, nothing can be more deceptive, especially as, according to your own story, you only heard a few words uttered; and to arrest him in the house of his employer and relative, who is believed to be a wealthy and respectable, although hard man, would be of very serious consequence to me.'

Maurice restrained himself, as an object was to be attained. 'Sure, your Honour, that minute in which he spoke was hours to me, fearing what there might have been done under my roof. And do you think that the prisoner in his condemned cell could ever be mistaken in the sound of the voice of the jailer telling him to get up and eat his last meal, and look for the last time on the sun shining through the bars? It is the sudden fright and the great sorrow that bring new things to us as if we had known them all our life. Pass

little children at play in the streets, and you would not know the voice of one of them from another; but if the cart-wheel should touch one of them, and it called out for help, would the sound be forgotten, or the scream of the mother too far off to assist the creature? But I have other reasons for thinking him guilty of more than the one bad act. There were a great many forgeries passing at the last big fair of Mulla; Spelassy had the handling of much of the money which was paid away that day, as he was so accommodating in helping those who were not good at counting what they got when they sold; and I have found out that those who brought home unknownst to them the bad notes, were those who were in his company.'

'Only a ground of suspicion still,' observed the J.P.; 'but I shall consult with wiser heads than my own, and let you know the result.'

This was but a Barmecidal judicial feast to set before one thirsting for justice; and slowly and almost sullenly the visitor moved into the hall, and from thence into the congenial darkness so suited to his own feelings.

MICROSCOPIC INGENUITY.

FROM the earliest times down to the present day, many examples of minute mechanism have appeared, interesting from the patient ingenuity displayed in their production. We propose to give our readers an account of one or two of the most curious of these tiny pieces of handicraft. In the year 1578, Mark Scalliot, a blacksmith of London, made 'for exhibition and trial of skill one lock of iron, steel, and brass of eleven several pieces and a pipe key, all clean wrought, which weighed but one grain of gold.' He also made a chain of gold of forty-three links, to which he fastened the above-named articles, and put them round the neck of a flea, the insect thus becoming harnessed. As the chain, lock, and key weighed but one grain and a half, the flea drew them with ease; a proof that if the blacksmith's hands were large and sinewy, they must have had the delicate touch of a watchmaker's.

A beautiful piece of mechanism constructed by M. Cuvius probably stood out prominently in the recollection of Louis the Great's childhood. Described by the inventor: 'It consisted of a small coach drawn by two horses, in which was the figure of a lady with a footman and page behind. This coach being placed at the extremity of a table of a determinate size, the coachman smacked his whip, and the horses immediately set out, moving their legs in a natural manner. When the carriage reached the edge of the table, it turned on a right angle, and proceeded along that edge. When it arrived opposite to the place where the king was seated, it stopped; and the page getting down, opened the door, upon which the lady alighted, having in her hand a petition, which she presented with a courtesy. After waiting some time, she again courtesied and re-entered the carriage; the page then resumed his place; the coachman whipped his horses, which began to move; and the footman, running after the carriage, jumped up behind, and it drove on.'

For the amusement of the same monarch was constructed, by Father Truchet of the Royal Academy of Sciences, 'an automaton consisting of moving pictures, which was considered a masterpiece of mechanics in the seventeenth century.'

The royal lessee and manager called it his *little opera*. One of the pictures represented an opera in five acts, and changed the decorations at the commencement of each. The actors performed their parts in pantomime; and this moving picture was only sixteen and a half inches in breadth, thirteen inches in height, and very little over an inch in thickness for the play of the machinery. The representation could be stopped at pleasure, and made to re-commence at the same place by the operation of a catch; the addition of which to certain marionnettes immortalised by Cervantes, might have prevented the terrific onslaught of the fiery Don on the villains of the play. The year 1711 saw Mr Penckethman's invention, the Parthenon, or the Temple of the Gods; the work of several years and great expense. It is described as a magnificent machine, consisting of several curious pictures and about a hundred figures, which moved their heads and limbs as naturally as living creatures.

The following are from a list of 'miracles of art' exhibited in London in the year 1745: 'The little furniture of a dining-room, consisting of a dining-table, with two figures seated as if at dinner; a footman waiting; a card-table which opens with a drawer in it; frame and casters; looking-glass; two dozen of dishes; twenty dozen of plates; thirty dozen of spoons, and twelve skeleton-back chairs with claw feet. All the above particulars are contained in a cherry-stone. A laudan which opens and shuts by springs, hanging on braces, with four persons sitting therein. A crane-neck carriage, the wheels turning on their axles; a coachman's box, &c. of ivory; together with six horses and their furniture; a coachman on the box, a dog between his legs, the reins in one hand, and whip in the other; the footman behind, and a postillion on the leading horses, in their proper liveries—all so minute as to be drawn by a flea. The curious little four-wheel open chaise, with the figure of a man in it, all made of ivory, drawn by a flea; which performs all the offices of a large chaise, as running of the wheels, locking, &c., weighing but one grain. A flea, chained by a chain of two hundred links, with a padlock and key, curiously wrought; the chain and flea, padlock and key, weighing but one-third of a grain. And a pair of steel scissors so minute that six pair may be wrapped up in the wings of a fly; the said scissors cut a large horse-hair.'

The *Plymouth Gazette* of 1828 contained an account of a miniature cannon, which is thus described. It is complete in all respects, having a bore and touch-hole; the gun is made of steel, the carriage of gold, and the wheels of silver; and the whole weighs only the twenty-ninth part of a grain. The workmanship is very beautiful, but cannot be distinguished except through a powerful magnifying glass; the size of this warlike engine being only that of a common pin's head. That surely was a curiosity that might have made Mr Sam Weller's fortune, had he taken out a patent for his 'double million magnifying gas microscopes of hextra power.'

There have been some curious toys in which fleas have been the performers. In 1829 a man exhibited in London two fleas, one drawing a kind of car, and the other a lock and chain, with the greatest ease. In Nottingham, also in the same year, there were two fleas shewn which had gold

chains placed round their necks, the very Lord Mayors of fleas. One of them drew a carved cherry-stone, and the other a silver cannon. We should also mention the case of a flea at Augsburg that drew a chain of steel made with links so fine that 'though it be nearly a span long the flea will lift it up when he leaps.' A London representative of the sharp fraternity drew a four-wheel carriage on springs, with four persons inside, the coachman on the box, and a footman behind, 'all proper,' as the language of heraldry hath it. Another flea is recorded to have given some evidence of civilisation by working the bucket of a well; thus undergoing a species of hard labour for so often disturbing the peace of many a sleeping martyr. Some of these vampires, furnished with golden saddles and bridles, have carried little effigies of Bonaparte and his aides-de-camp. A still further demand is made on our imaginations when we read of 'a representation of the siege of Antwerp—a suitable name, by the way, for a fort attacked by insects—in which fleas discharged firearms, the explosion of which was audible to the spectators; and General Chassé and Marshal Gerard appeared on fleaback'—encouraging their 'crimson-coated varlets.' This melodrama was followed by a grand ballet. But here the enthusiastic historian surely assumes his readers to possess a much larger bump of credulity than a phrenologist would give them credit for.

In the matter of patience and ingenuity, Englishmen have no doubt often been surpassed by foreigners. The *Carlsruhe Gazette* mentioned a piece of mechanism which perfectly imitated the voice of a child, and produced distinctly every word with its proper modulation. The mechanism was, it is said, very simple, and consisted of sixteen levers answering to the sixteen simple sounds, moved by so many keys, like those of a harpsichord, so that these, properly touched, produced any articulate sounds required—an article, by the way, which certain members of parliament and bashful young suitors might find very useful.

In the cathedral of Augsburg there are to be seen some rare specimens of drinking-glasses, made hollow and well shaped, with a ring made of the piece in turning, which encircles between the bottom and body of the glass, and cannot be taken off. 'I often,' says Misson, in his *Voyage to Italy*, 'examined this little miracle of art with a good microscope, and observed the stripes and traces of the tool with which they are turned, so that they have no secret in it, but that it was the pure work of the eyes and hand.' A celebrated old manuscript waxes enthusiastic on 'The Germaine Master-piece,' to quote verbatim, 'being that famous knife, which hath been for some time in England and highly applauded by the most exquisite artists; containing in the hilt sixty odd several figures, some engraved, others carved, and all to the admiration of those that beheld them. It hath two keys, which open seven locks, including those various Rarities contained therein; it was seven years a-making, and valued by the Authour, that famous artist of Germany, at Fifteen Hundred Pounds, and is now exposed to public view for England's satisfaction. To be seen at Bartholomew Faire, against the King's Head, with other rarities by me, JOHN GIFFORD.' Were it worth while, many other instances could be given of mis-spent ingenuity on microscopic but useless articles.

COUNTRY IN AUTUMN.

JOHN LOGAN, who has been described as one of those unfortunate men of genius whose life has been marked by disappointment and misfortune, was born at Soutra in East Lothian, in 1748. He early evinced poetical talent, and throughout the whole of his productions there runs a vein of tenderness, and moral sentiment tinged with melancholy. We give an extract from one of his best pieces, written during a visit to the *Country in Autumn*.

'Tis past! no more the Summer blooms!

Ascending in the rear,
Behold congenial Autumn comes,
The Sabbath of the year!
What time thy holy whispers breathe,
The pensive evening shade beneath,
And twilight consecrates the floods;
While Nature strips her garment gay,
And wears the vesture of decay,
O let me wander through the sounding woods!

Ah! well-known streams!—ah! wonted groves,
Still pictured in my mind!
Oh! sacred scene of youthful loves,
Whose image lives behind!
While sad I ponder on the past,
The joys that must no longer last;
The wild-flower strewn on Summer's bier,
The dying music of the grove,
And the last elegies of love,
Dissolve the soul, and draw the tender tear!

My steps, when innocent and young,
These fairy paths pursued;
And wandering o'er the wild, I sung
My fancies to the wood.
I mourned the linnets-lover's fate,
Or turtle from her murd'ring mate,
Condemned the widowed hours to wail;
Or while the mournful vision rose,
I sought to weep for imagined woes,
Nor real life believed a tragic tale!

Alas! Misfortune's cloud unkind
May summer soon o'ercast!
And cruel Fate's untimely wind
All human beauty blast!
The wrath of Nature smiles our bowers,
And promised fruits and cherished flowers,
The hopes of life in embryo sweeps;
Pale o'er the ruins of his prime,
And desolate before his time,
In silence sad the mourner walks and weeps!

Yet not unwelcome waves the wood
That hides me in its gloom,
While lost in melancholy mood
I muse upon the tomb.
Their chequered leaves the branches shed;
Whirling in eddies o'er my head,
They sadly sigh that Winter's near:
The warning voice I hear behind,
That shakes the wood without a wind,
And solemn sounds the death-bell of the year.

Nor will I court Lethæan streams,
The sorrowing sense to steep;
Nor drink oblivion of the themes
On which I love to weep.
Belated oft by fabled rill,
While nightly o'er the hallowed hill
Aërial music seems to mourn;
I'll listen Autumn's closing strain;
Then woo the walks of youth again,
And pour my sorrows o'er the untimely urn!

AUTUMN.

SUMMER has departed, and the autumnal winds are blowing chill. The Spirit of the year, who rose, violet-crowned, from the pure snows of Winter's grave, to grow through Spring to Summer from a lovely child to a fair and gracious woman, has stood on the last boundary of Summer's land, and has once more gazed backward over the shade and sun-checkered road she has traversed with such kindly intent, before leaving it behind her for ever. The noonday sunshine streams upon the deepening auburn of her hair, and reveals her beautiful as ever—with a beauty whose curves are more grandly modelled, and a tender smile that is grave with sadder meaning. The roses that bloomed so brightly in her path and all about her, have shed their sweet petals, and the winds have blown them and dried them; but as the spirit survives the body, so the scent of the flowers that owed their living beauty to the warm caress of her hands, still lingers near her, recalling the sweet memory of their lives. The soft warm breezes are loath to leave her, and woo her kisses still; the sun blazes as though there were no coming winter for him, and the air is warm; but on a sudden the winds rustle in the already thinning trees, bringing a wild flight of crackling leaves, whirling, as though in homage, to her feet. She shivers beneath the bleak touch of Autumn, and turns away with a sigh. But soon the sigh relaxes, and gives place to a loving smile, as she finds that though inevitably nearing the goal of decay and death, it is in her power still to gild whatever of that decay lies beneath, and to fling over it all a glorious mantle of beauty and plenty; and with that comfort in her heart she travels onward down the fair slopes of autumn, making them rich with a wealth of gorgeous beauty and luxuriant plenty that neither spring nor summer knew. She waves her wand, and straight the fields grow splendid with the ripening gold of oats and rye and wheat, which hang their richly laden heads, grown too heavy for the slender stems. The winds murmur gently through the rustling corn; the sun darts down his

fiery beams, brightening the wealth of moving yellow brown to a living, glowing sea of gold; and the Spirit laughs with a joy whose generous warmth falls over all the earth, deepening every tint, and making each odour of fruit and flower luscious with heavier fragrance, and filling every nook and corner with precious gifts to man; and as she laughs the sound murmurs rippling through the air:

'Tis the rush of the breeze through the dewy corn
And the garden's perfumed dyes.

The little delicate wild-flowers are dead, but the wastes and marshes and valleys are richly draped with ferns and orchids; the mountains are purple with heather; and in the woods spring thousands of fungi, graceful in a hundred forms, and glowing with scarlet and mauve and gold.

Gardens are redolent with the fragrance of bloomy peach and juicy apricot, green-gages, red-checked nectarines, and purple plums; and the orchards are rich with shining apples and luscious pears. The corn has been reaped, and gathered, and thatched; and the country is filled with the hum of thrashing-machines and the echo of many voices. Harvest-home is still the great rural holiday in England, the completion and crown of the countryman's labours; and the harvest-moon shines bright and clear above the merriment of men and the gleaned and garnered treasures of the earth. The hedges and ditches and wooded dells are wreathed in ivy, and the crimson-berried arum, and green briony garlands; and feathered fringes of the clematis are intertwined with the red-streaked trumpets of the honeysuckle and the freckled caps of the tall foxglove. Clustering nuts hang their hazel heads, and the graceful acorn covers the sturdy oak. And over and above all the tiny spider throws an enchanted web of beauty in the transparent veil of silver tissue that he weaves over all the landscape, shifting and glancing in argent light over stubble-field and leafy copse, twining in beauty round the velvet head of the tall bulrush, and curtaining in the last awaying bluebells on the hill.

Autumn has not the exquisite freshness of spring or the flowery brightness of summer; but it is still rich in a beauty that is draped in robes of gorgeous colouring; for the woods are glorious with the magic of amber and crimson light; and when the early twilight falls, and the sun sets, the brilliance of their dyes seems to be new-born in upper air, as the skies burn and blaze at the dictate of the dying sun, who darts his slanting rays at the painted mantle of the woods, and sets them afire with a heavenly flame, till earth and sky and the reflected world beneath the waters meet in a universal glory; and when it dies, and the earth darkens, a veil of misty light rises from the face of river and lake and marsh, and infolds the gloaming in its dense white folds. But beautiful and weird as it is, the mist strikes damp and chill, and those who are wrapped in its clinging mantle are glad to exchange it for the warmer, brighter atmosphere of the cosy room, which sends its gleams of lamp and flickering fire-light in long broken lines out across the white mist, to lure them in. In the country, and more especially by the river, how beautiful with all its weirdness that filmy mist-veil—Earth's pale night-dress—is. How capriciously it seems to rise in isolated places; how fantastic are the shapes it assumes; how swiftly it gathers height and density; and how suddenly it again shrinks back into insignificance. One minute you are gliding peacefully with the stream, the splash of the oars being the only break in the twilight stillness (and when is Nature more still than in an autumnal evening); you gaze at the crimson glow in which earth and sky are bathed, and you wonder dreamily which is more real, the quiet darkening world above, or the tremulous shadowy world beneath the waters; you look with a vague curiosity at the quiet figure, so strangely like yourself, that gazes up at you from below, and try to imagine the life down there. These thoughts have passed like a flash through your brain, yet when you look up again you find the outline of the familiar scene changed as by magic. Far and near, white draperied forms seem rising and spreading, advancing, retreating—blotting out in their gliding progress a clump of willows, a cottage, a field—a very army of formless shapes, that draw ever closer together, clouding all before them; the banks recede, and the river widens into a sea—fantastic, floating fringes of white vapour rise from beneath, and wreath your boat, effacing that quiet figure below, as they stealthily creep up and over the rowlocks, and round your feet and knees, and up to your very throat, which they seem to grasp with icy fingers. You shiver at the chill, and suddenly realise that the world has disappeared and you with it, and that you (or is it your spirit?) are alone, suspended in the midst of a rolling ocean of vapour, through which you catch no glimpse of earth or sky, moon or stars.

Looked at in some lights, the time about October is the saddest time of the year, for in no other are decay and death so rife; and its great brief beauty only seems to render it more pathetic still; but as truth is many-sided, so is the autumn-time, and viewed in another light, surely it is the most boisterous and jolliest time in all the year. Never is the earth so overflowing with Nature's royal gifts; never is the human heart so full of joyous gratitude, for in autumn is the fulfilment of all the

promise and hope and faith of spring; never is the face of old, grape-crowned Bacchus so broad or so jolly, for in the sunny south the vineyards blush rosy red beneath the sun's burning kiss; in a thousand vats the must foams round the feet of men and girls, and the land runs red with sparkling wine—which is surely one of Nature's kindest gifts, though man in his brutal ignorance but too often abuses it, and turns the blessing into a bitter curse. Beneath England's shady skies the grape does not blush so brightly; but in green and graceful beauty our twining hop-gardens put to shame the foreign vines, whose natural grace is so often destroyed by being confined to the ugly forests of upright sticks, excepting in fair lazy Italy, where, like our own tendriled hops, they are allowed to twine from pole to pole, from tree to tree at their own sweet will, seeming a very troop of laughing Bacchantes dancing and swaying to the rhythm of the winds and breezes, hand clasped in hand.

Then when the sunshine pales, and winds blow bleak and thin the trees and hedges, autumn is still dear to the heart of the sportsman and the hunter, bringing manly and spirit-stirring sports which fill a large place in the life and interests of many, and helping to form some of the sterling qualities that go to the making of the English country-gentleman.

What can be more delightful and healthful than the brisk ride, to the accompaniment of 'A southerly wind and a cloudy sky,' through the fresh dewy lanes, that are bright with hips and haws, and dearly with purple nightshade, to the meet, where horses, hounds, and men are all pervaded with the general excitement; and when the hounds throw off, and the horses follow with winged feet across ploughed fields, up quiet country roads, over green commons that are prismatic in the morning sun with the airy draperies of innumerable dewy gossamer webs; through woodland paths that are beautiful with the glory of dying leaves, and over hills and downs whose shrubs shew crimson in the early light; through quiet farm-yards, and across hedges and ditches and sparkling streams

attended by the excitement of the huntsman's horn, tongue of hounds, shouting of men, and neighing of horses, as the scent is found, and Renard has 'gone away!'

Cruel though it seems to many, this pleasure, attained through the death of an innocent animal, is after all but an emblem of what Nature is constantly teaching. Pain and pleasure, ugliness and beauty, life and death, go ever hand in hand; and in autumn, at the same time that Nature's chief occupation is in dissemination or vegetable birth, its chiefest beauty arises from the vegetable death that is going on everywhere, and filling the earth with glory; so that we see the general mother Earth clothing herself in the lovely decay of her dead children, even while the full seed that shall be the hope and the life of another year sleeps warm within her bosom.

And as the trees turn to gold beneath the Midas touch of nature, and the leaves fall one by one to transfigure the Earth with the loveliness of death (as if to give her a peep beyond the grave), the fierce autumn gales that tell of coming winter begin to blow, and the 'sere and yellow' leaves are torn from the creaking boughs, and the forest world stripped of its pride, shews like a desert.

So, since the beginning of the world, Time has moved on through the ages; great Nature has kept on her way; spring, summer, autumn, and winter have followed on in unvarying succession, and filled the earth with ever-recurring beauty—Time, the Seasons, Nature, have travelled on in obedience to immutable laws, which in their changeless, resistless sequence pass over unheeded the individual pain and sorrow, sin and death, that fill the earth with a bitter cry. Wherever through the ages has existed life, there has been death; beauty, wherever ugliness; where pleasure, pain. Evil and suffering and death play as large a part in Nature's economy as good and life and beauty; they are dependent one on the other, and must go hand in hand; for until Time shall end, life must be evolved from death, as death from life, and the pain and evil of one must be the good and delight of another. The world is full to overflowing of beauty and truth, love and hate, good and evil, and all seems wrong and confusion and disorder. But above and through all, the mighty Spirit that rules the universe through immutable, unchangeable laws, evolves order from chaos, good from seeming evil, light from darkness. As Nature travels on blind and beautiful down the centuries, heedless of the cries and groans that rise from every nook of the earth to heaven, a spirit of infinite beauty and fitness and harmony is breathed through the discordant, contrary elements, though we may not see it here, and the universe pursues its foreordained inevitable way to the solemn immortal music of Love and Power and Justice, which are eternal and divine.

FALLEN FORTUNES.

CHAPTER XLVIII. BREAKING IT.

JEFF remained at his post in Abdell Court for the remainder of that eventful day, though with a mind but little disposed for his business duties. As he had expected, however, and to his great relief, his employer did not return. The young fellow would have found it difficult indeed to maintain in his presence that indifferent air and manner which Dalton had enjoined upon him; and however successfully he had played an assumed part with the editor of the *Smellfungus Magazine*, it is doubtful whether he would have been equally fortunate with Richard Holt. When the office closed he betook himself at once to Brown Street, where he found Jenny, for the first time since her illness, sitting in the little up-stairs parlour—to which, even with her ordinary lodgers, Mrs Haywood hesitated to give the title of drawing-room, but modestly termed it her 'first-floor front.' There were flowers in the room, and in the window-sill there was a flower-box full of bud and blossom, that filled the air with fragrance.

'Is it not beautiful?' cried Jenny, drawing her visitor's attention at once to this unwonted ornament. 'Does not our room look a perfect bower?'

'A very proper cage for a sick bird to dwell in, till she is strong enough to fly at large in the sunny south,' answered Jeff gallantly.

'Now, none of that, Jeff. I am not Mr Sanders, remember; so please to stick to what I know is your proper element—prose. I can't think what has come to dear Kitty, that she should suddenly rush into these extravagances: it is not only flowers, but all sorts of delights and delicacies; and

not for my sake only; for she has actually bought Tony a trap, hat, and ball! One would have thought she had had a fortune left her—except for her face, poor darling! Here her voice grew suddenly grave. 'I am afraid there is something—I mean, more than Tony and the baby and myself—upon her mind, Jeff. I can't make her out at all. She is sometimes quite extravagantly gay: a put-on manner, I am sure; and then again, she becomes more depressed than I have ever yet seen her; and that, alas! I can see is natural. Do you know anything, dear Jeff, about my Kitty, that I don't know?'

Jenny looked at him very earnestly as she said these words, but the young man's face only reflected her own quiet sorrow.

'Nothing, I think, Jenny, that you don't know,' he answered. 'She has avoided me—I may almost say shrunk from me—for this long time; ever since you have been ill, indeed.'

'And she has seen Mr Holt,' sighed Jenny. 'O why, O why have I been struck down like this,' added she passionately, 'and rendered a useless burden, while all things have been going wrong! Jeff, you'll lose her; mark my words, we shall all lose her, and she will fling herself away upon that man, for our poor sakes.'

'Don't, Jenny, don't! I beseech you not to give way. There is a God in heaven, who will not permit it.'

'Ah, you think so,' returned Jenny bitterly. 'It is a happy faith.'

'It is a true one.'

'What! that horrible things are not permitted to happen every day? I see there is another mail from Rio: the *Sancho* has arrived. That makes the fifth; and still no news—no gleam of hope.'

'There is hope always, Jenny.' She looked up at him as quickly as the bird to which he had likened her, with swiftly scrutinising glance.

'He has come! Our father is alive!'

Then, but for his arm, she would have fallen: her cheeks were white, her eyes were closed; she lay upon his breast like a thing of stone.

'Great heaven! have I killed her with my stupid folly?' exclaimed Jeff in horror. 'How could I hope to keep such a secret from eyes like hers! Jenny, Jenny, speak to me!'

'I hear you: I shall live to see him yet!' she murmured faintly. 'Lay me down—with my face to the wall, Jeff. Leave me alone with my Maker, whom I have denied. He will send the tears presently.'

'You will not speak of this, Jenny—just yet?' said he, once more alarmed at her long silence.

'To no human ear: no, Jeff. Leave me now, and go to Kitty.'

Jeff left the room, closing the door softly behind him. In the little passage he met Nurse Haywood.

'Well, Miss Jenny is getting on nicely, Master Geoffrey; is she not?'

'Yes, nurse. But she is tired, and wishes to get a little rest; so do not let her be disturbed. Where is Kitty?'

'Lor bless ye, why, where should she be except with the baby! She can scarce ever be got to let him out of her sight. It's my opinion, what with attending to that dear child, and housekeeping, and always being worried about this and that, as she is a-wearing herself out. I daren't tell Miss Jenny, but I have come across Miss Kitty at times when she looks fit to break her heart, though she has

always a smile and a kind word for a body when she speaks to one.'

'I hope she will speak to me, nurse. Please to say I wish to see her on very particular business, and that I will not detain her long.'

As he waited in the sitting-room down-stairs, revolving in his mind, how he should break his great news to Kitty, but failing to hit upon a plan, there re-entered to him Mrs Haywood.

'Miss Kitty is very sorry, sir, but she is much engaged; and if you would kindly write her a line, instead of seeing her.'—

'I must see her,' interrupted Geoffrey impatiently. 'Did you not tell her my business was very particular?'

'Well, yes, Master Jeff, I did; and that was the very thing, to tell you the honest truth, as seemed to scare her. She has got enough and to spare on her poor mind already, you see.'

'Please go and tell her, nurse, that it is absolutely indispensable I should see her, but that what I have to say will not distress her. Be sure you tell her that.'

'For, Master Jeff, you ain't a got any good news for her, have you?' answered the old lady in a trembling voice. 'Nothing about Mr John—him as I remember as young as you be, and as comely?'

'There is no time to lose about what I have to say,' answered Jeff, with as constrained a manner as nature permitted him to assume; 'and I do beg you will give my message.' His heart smote him at having to snub the good old dame, but he was also irritated at her sagacity, or rather at the transparency of his own attempts to conceal his errand. If his heart had been in literature, Mr Sanders would have read him as easily as a proof-sheet: it was only where his feelings were not concerned that Geoffrey Derwent could play the hypocrite. While still conning that unwonted part, Kitty entered the room.

'Well, Jeff, what is it?' cried she, holding out her hand. 'I never knew such a man of mystery. There is baby taking his first beef-tea, and yet Nurse Haywood says I must leave him to attend your Highness.' Her air and manner were too light and gay to be natural to the occasion in any case; but contrasted with her looks, which were wan and worn beyond anything he could have anticipated, they seemed unreal indeed. Her eyelids were heavy and swollen, and on her fair white brow sat unmistakable care and woe.

'I am not come upon my own affairs, dear Kitty,' said Jeff assuringly, 'or I would not have been so importunate.'

'The affairs of no one else can interest me—and all of us—half so much,' she answered smilingly.

'I meant to say I should not have intruded here, without a sufficient motive, Kitty—that is all. The fact is that—that—Mr Holt.'—

At that name a shadow fell on Kitty's face and chased her smile away; she had been standing hitherto, but now at once sat down.

'That Mr Holt has had a summons to Liverpool with respect to the arrival of the *Sancho*.'

'Ah, yes; that is the Rio steamer,' she answered sadly. 'The fifth that has brought no news.'

'Well, it has brought news.'

'Of the *Flamborough Head*? What news?' inquired Kitty eagerly.

'The ship was wrecked; that's certain; but there were some survivors—two.'

'Two,' repeated Kitty mournfully; 'but two!'

'It is not yet known for certain—that is, publicly—who they are; but—now, don't cry, Kitty, darling Kitty—but there's a hope.'

'A hope? What! of papa's being alive, and he not here! I don't believe it. I want no more such hopes, Jeff; I can't bear them. They are killing me, I tell you; they are driving me to— I don't know what I am saying, Jeff, but I can't bear them.' Her head had fallen forward upon her open hands, and she was crying bitterly.

'Do you suppose I could come here to mock you, Kitty? I came to comfort you, to gladden you.'

'To gladden me?' She shook her head; her tone was as though he had suggested the most unlikely thing on earth; and yet she raised her face all wet with tears.

'He is alive, Kitty; your father is alive!' She looked like one awakened from a dream; astounded, dazed: the light of joy was breaking on the night of woe, but very slowly.

'Alive! Papa alive! Where is he?'

'In England. You will see him soon. I have seen him.'

'Thank God, thank God!' she murmured. 'Oh, thank God!'

Still she did not rise, nor shew any passionate excitement, such as he had expected, and had seen in Jenny. 'Is he well, Jeff?' she went on slowly.

'Yes, quite well. Philip Astor is with him, and has been very, very good to him. He is to be called Dalton now, and recognised as his brother.'

'When shall I see him? When is he coming? Why is he not here?'

'Because he feared the shock might be too much for you and Jenny. He is close by. Shall I fetch him in, or will you wait a little?'

'Wait a little—just a minute.' As she spoke, a joyful cry burst forth in the quiet street. Both glanced through the window, and on the other side of the way was Tony clasped in the arms of a thin grizzled man, in wayworn and outlandish garb. Behind them stood another. They were looking towards the house, and Jeff beckoned to them frantically, and ran to the front door. The next moment, Kitty, sobbing as though her heart would break, was strained passionately to her father's breast.

'Don't cry, don't cry,' he whispered, though the tears were falling down his own weather-beaten cheeks like rain; 'and you have not yet kissed dear Philip—your Uncle Philip.'

DRUMMERS AND FIFERS.

And the village 'wakes to the sound of the drum.
Old Song.

Drums and fifes are probably the most ancient, as they are certainly the most familiar, of all our musical paraphernalia; and they have been through many ages associated with scenes of warlike interest and display. Whatever be their origin, there is a charm connected with the fife and drum which is alien to all other instruments, and which makes the music they produce more applicable to military purposes than any other. It would be difficult, if not wholly impossible to describe the cause of this, but it is certain that on the line of march men find it easier to keep step to the lively tones of the fife and the brisk roll of the drum than to follow a brass band, which cannot be

distinctly heard further than about half the length of a battalion. It is a singular thing, however, that it is only the English-speaking peoples who make this kind of music national, for the French and other continental armies generally march to the sound of the drum alone, or to a combination of drum and bugle, when their brass bands are not playing. But this kind of music has never found favour with our British regiments, though many attempts have been made to introduce it. It has a foreign ring about it which makes it unpleasant to English ears, and it is of a very monotonous character, there being no more than five notes on the common bugle; consequently the few tunes that can be played upon it have a sameness about them which is exceedingly wearisome to the ear. But this does not prevent its being used occasionally, as a change to the music of the trombone or the fife.

The chief glory of the drum lies in the crispness of its sound and the beauty of its appointments, though of late years this useful instrument has been sadly used, by being cut down to a mere skeleton, composed principally of bolts and screws, with scarcely any body to it at all. The handsomest specimens of the drum which have been familiar to us from childhood and to preceding generations, are those borne by the drummers of the Guards, which are beautifully emblazoned with the royal coat of arms and the names of the battles in which each regiment has been engaged; and the bearers take a pride in keeping the plain brass brilliant, while the emblazoned portion is always well polished with beeswax.

'Drummer' is the lowest *rank* in the British army, for the private soldiers are included in the term *file*, and the former receives a penny per *diem* more pay than the latter. But though humble, it is a rank which ought not to be despised, seeing, as we shall presently shew, that it has been ennobled by brave deeds, and, like the highest rank in the army, honoured with the presence and patronage of royalty itself. The holders of the rank are generally the sons of soldiers, and have been educated in the regimental school, the attendance at which is still kept up, even after they join the service, until they attain the age of eighteen. Before they are permitted to enter the regiment, however, the consent of their parents is obtained, and the boys themselves must be thoroughly trustworthy and intelligent. As, however, the supply of boys, sons of men still serving, is limited, in consequence of the restrictions with respect to marriage in the army, many of them are obtained from those excellent institutions, the Duke of York, Caledonian, and Hibernian Schools, where they have already received a semi-military education, fitting them for the new career which they have chosen to adopt. The barrack-life of a drummer is not an enviable one, for the youth is exposed to many evil temptations, and is often made the slave or errand-boy of the common soldier. But these evils have of late years been considerably decreased by the wise act of separating the boys from the men and allowing them to have a mess of their own. The duties of the drummer are of a somewhat varied kind, and are not by any means limited to the pleasant task of playing at the head of a famous regiment. He has to mount guard in his turn whenever the guard is under the command of an officer, either carrying his

drum with him, or in the case of a fifer, his bugle; his duty when on guard being to go on official (and often non-official) errands, to sound or beat the salute and tattoo, and to accompany with a lantern the officer's 'rounds' at night. In barracks, the drummer performs orderly or picket duty, which consists in sounding or beating the 'calls' and warnings for the assembling of the troops for the different drills and parades.

When in camp the whole band of drummers and fifers assemble four times a day under the command of the drum-major, and play what is termed *Réveil*, Troop, Retreat, and Tattoo or as some are inclined to call it, the Taptoo. The *Réveil* (from the French verb *réveiller*, to awake) is generally played at five o'clock A.M. to rouse the camp from its slumbers; and a very pretty effect it has when one stands at a distance and listens to the various bands playing it as they march round their camp, each introducing into the regulation music some favourite national air. Troop is played at nine A.M. and is the commencement of an ordinary day's proceedings; Retreat at sunset, or 'gun-fire' as it is sometimes called, being the time when the evening gun is fired and the standard lowered; and Tattoo or Roll-call at ten o'clock P.M.* Twenty minutes is allowed for the duration of the roll-call, the commencement and finish of which are sounded on the bugle, and are called the first and last 'posts.' It is only the infantry regiments which possess a drum and fife band, the members of which number from twenty to thirty for each battalion.

The uniform of our drummers and fifers must be familiar enough to the eyes of every Englishman; yet very few people imagine that there is anything beyond mere ornament in the spotted lace which adorns their scarlet tunics. But there is nothing connected with the British army which is too insignificant to bear a history of its own, and consequently we find that the blue spot which is scattered so thickly on the drummer's tunic is the celebrated *fleur-de-lis*, or French lily, which being worn by the *highest* rank in the royal armies of France was, as a mark of our military superiority, bestowed upon the *lowest* rank in the British army. When in the field, the fife gives place to the bugle, and a bugler is attached to each company, the commanding officer also being accompanied by a bugler of his own. The remainder of the drummers are employed in the delicate and difficult duty of carrying the wounded to the hospital or ambulance, they having previously been taught how to bandage up wounds in the absence of the surgeon. Indeed many a brave fellow has ere now owed his life to the skilful and gentle hands of a little drum-boy, either from a timely bandage, or that 'cup of cold water' which, to a wounded man on the field of battle, is worth all the gems in a monarch's crown.

Instances have occurred in which the youthful soldier-Samaritan has been stricken by cruel death in the midst of his charitable work; and many of our readers may perchance have seen the exquisite little water-colour sketch by the Queen's eldest

*Hitherto, the time for roll-call or tattoo has varied, it having been nine o'clock in summer and half-past eight in winter when in camp, and nine in winter and ten in summer when in barracks; but a general order just issued fixes the time at ten P.M. all the year round—a boon which will be appreciated by the army at large.

daughter, depicting a scene of this kind which happened in the Crimea. The drummers of the British army have at all times acquitted themselves nobly in the field; and had we space at our command, we could give illustrations of individual acts of bravery that ought for ever to cast a halo around the name. It must suffice, however, to mention one or two incidents that have occurred within the memory of many who are still living. In one of the battles of the Peninsular war, a drummer, whose name and corps have both been unfortunately lost to history, having wandered from his regiment, was taken prisoner by the French and brought before Napoleon as a spy. Bonaparte frowned heavily upon his prisoner as he demanded of him his rank in the British army. On being told it was that of a drummer, the Emperor, to test the truth of the reply, caused a drum to be brought, and requested his prisoner to beat 'the charge!'

The drummer's eyes sparkled with enthusiasm as he gave the terrific roll and rataplan demanded.

'Now beat a retreat,' said Napoleon.

'I cannot,' replied the drummer proudly; 'no such a thing is known in the English army. We never retreat.'

'Good!' exclaimed the Emperor. 'You are a brave lad, and may rejoin your own army.'

Then turning to those near him, Napoleon gave directions that the drummer should be conducted back in safety to the English lines. Fortune is, however, a fickle jade, for at the battle of Waterloo this humble hero met with a sad death. He had been out with a body of skirmishers, who were suddenly attacked by cavalry and driven back on their supports. The latter formed square, and the earth shook beneath the feet of the advancing cuirassiers as they rode right up to the points of the bayonets. Beneath that rampart of steel lay the drummer, who had been too late to seek the shelter of the square. He was safe, however; and when the horsemen were driven back, he jumped merrily upon his legs and shouted: 'Hollo, comrades! here I am, safe enough!' These were the last words he ever uttered; for at that moment a round-shot carried his head off his shoulders and bespattered his comrades with his brains. Such is the fortune of war.

In the Crimea, on the evening of the day on which an unsuccessful attack had been made upon the Redan, a drummer was observed to leave the shelter of the trenches with his can of tea in his hand, and in the midst of a fearful shower of shot and shell from the Russian batteries, he threaded his way amongst the wounded, giving a drink here and a drink there until his can was emptied. Then flinging the empty can towards the enemy with a gesture of defiance, he walked coolly back to his post. By the means of this timely assistance some of the wounded were able to bear their sufferings until darkness enabled them to be rescued from death. The drummer-boy who did this brave deed received the Victoria Cross from Her Majesty's own hand.

One more incident we may mention of recent occurrence. During the Abyssinian expedition, a bugler whose name we have forgotten, though it is inscribed on England's roll of honour, was appointed field bugler; and as such, his duty was to accompany the general in command. When the army approached Magdala, this gallant lad left

Lord Napier's side unseen, and reaching the gates before the storming-party, he was the first to dash into the stronghold of the tyrant. For this daring service he of course obtained the cross For Valour.

When a boy enters the army at a very early age, which sometimes happens in the case of one who has suddenly become an orphan, he is generally made much of by the officers, and eventually ranks as the 'pet of the regiment.' An instance of this kind occurred in one of the regiments of the Guards shortly after the Crimean war. A bright, intelligent little fellow about nine years of age, whose father had been killed at the battle of Inkerman, and whose mother, having three younger children to attend to, had applied to have her eldest child taken into the regiment, was duly enlisted to 'serve Her Majesty the Queen, her heirs and successors.' The boy was so small in stature, and yet so clean and smart in his appearance, that he soon became the favourite of all, from the colonel downwards. His usual place on returning from a field-day was on the back of the colonel's horse at the head of the battalion; the colonel himself, an Alina hero with one arm, walking beside the animal, and ever and anon making some remark to amuse the little fellow.

It happened at this time that the young Prince Arthur had begun to evince a taste for military life, and, by the Queen's command, the drum-major of this battalion, which was stationed at Windsor, attended regularly at the castle to teach His Royal Highness the drum. Her Majesty and the Prince Consort were often present on these occasions; and one day when the young Prince asked his tutor if there were any drummers in the Guards as small as himself (the Prince), the drum-major informed his royal pupil of the facts relating to the little soldier-boy mentioned above. With her usual kindness of heart, the Queen directed that the little fellow should be brought to the castle on the following day. Accordingly, the morrow saw the worthy non-commissioned officer and his tiny subordinate—the latter being as prim as brushing and pipeclay could make him, with his life under his arm and his forage-cap set jauntily on the side of his head—trudging up the castle-hill towards the royal residence. On reaching the royal nursery, they had not long to wait before Her Majesty and the young Prince made their appearance. The drum-major and his little charge instantly sprang to 'attention,' and brought their hands to the salute; while Prince Arthur, with a cry of delight, hastened forward and began to ask his brother-drummer a thousand and one questions. The 'pet of the regiment' was naturally shy in such august company; but he became reassured when the Queen, taking him kindly by the hand, addressed a few motherly remarks to him.

Then the royal drummer slung his drum, and calling upon the young Guardsman to 'play up,' the latter responded to the invitation with *God save the Queen*, the Prince joining in lustily the while upon his well-battered sheepskin. Her Majesty was greatly pleased with the simple compliment; and on the conclusion of the audience, she not only provided her novel guest with a good luncheon, but gave him a *five-pound note for his mother*. Prince Arthur continued his studies on the drum for several months afterwards; and when they were concluded, the drum-major received from the Queen's hands a handsome gold watch and

chain bearing an inscription, together with a portrait of the Prince dressed as a drummer, with his drum slung round his neck.

It may be well to mention here that the drum-majors of the Guards are also 'drummers in ordinary to the Queen,' their principal duty as such being to attend in their state clothing with the trumpeters of the Life-Guards (who hold a similar rank) whenever Garter King-at-Arms makes public a royal proclamation. This was done when peace was proclaimed in 1856, and the state trumpeters and drummers gave a flourish and a fanfare previous to the reading of the important document. The state clothing of the drum-major is very gorgeous, being embroidered all over with gold, and costs forty-two pounds each suit. It is renewed every seven years; and the old suit, which was formerly the perquisite of the wearer, is sold for the benefit of the public.

Independently of his bravery in the field, the humble drummer or fifer has at times developed extraordinary musical talent. As an instance we may mention a name which has long been popular in this country, especially in musical society, and is likewise well known and esteemed in our colonies in America—namely, that of Godfrey. About the year 1813, when this country was at war with Napoleon, a number of volunteers from the Surrey militia joined the Coldstream Guards, and amongst them was a fifer, who was likewise a good bassoon-player, and who, having joined the rank and file, attracted the attention of the officers by still applying his leisure hours to the study of music. This was Charles Godfrey; and on attaining the rank of sergeant in his new corps, he volunteered, amongst others, to go to the seat of war. But fortune ordained otherwise, for the bandmaster's post having become vacant, it was offered to young Godfrey, and accepted. He set himself hard to work in his new position until he became one of the finest military bands in the world—a reputation which it has ever since retained. The officers of the regiment were very proud of his success; and when in the course of time Mr Godfrey had completed his twenty-one years' service, they would not hear of parting with him, but retained him on handsome terms, until he eventually died in harness in 1863, after an honourable servitude of fifty years. His name and fame have been perpetuated in his talented sons, two of whom were bandmasters in the Guards before their father's death, and another succeeded him in the Coldstream, so that each of the three regiments possessed a Godfrey.* These clever musicians have not only made their bands famous, but have added some celebrated *morceaux* to the musical repertoire of the nation.

And not only music but literature also has bowed before the conquering steps of the drummer, for in the year 1863 we find Her Majesty the Queen acknowledging the receipt of some verses from the pen of a drummer in the Coldstream Guards. When our readers next hear the sound of the drum mingled with the shrill tones of the fife, they will, we trust, remember the examples of famous drummers and fifers which these pages record, and which, if we had the space at our disposal, could be

indefinitely multiplied. We might only mention that the colonel of one of the battalions of H.M. 17th Regiment has risen from the rank of drummer to his present post; and that Colonel M'Bean of the 93d Highlanders now commands the regiment in which he once served as a private soldier. England is served well and faithfully in every clime by all ranks and conditions of men, but by none more so than by those who, in the midst of perils, 'beat the Queen's morning drum round the world.'

FOLLOWING UP THE TRACK.

CHAPTER IX.

THE summer assizes for the county of Tipperary were to be opened at Clonmel on the 10th of July 1808; and how unlike in those days such an eventful episode in rural life, from the prosaic routine which now ordinarily prevails, when, instead of groups of barristers riding into the town, and the judges coming in with great state and parade, the levelling railway puts an end to all display and romance upon the occasion of the arrival of Her Majesty's actors on the tragic stage. But at the period with which our story is conversant, the assizes were the important epoch to which all local matters of interest were referable. The dance of death in the jail by day was to go on side by side with the cotillon or Sir Roger de Coverley gone through with vivacity and animation in the Assembly Rooms by night; and it was very exciting for those who had to lead quiet lives (save in the hunting-field) during the next six or seven months, to take up their position in the grand-jury gallery and look down from thence into the dock, when, for example, some man accused of murder was on his trial. To notice the tell-tale features of the accused; the pallid lips, and the mechanical grasping of the bars before him, and the intent eyes fixed upon the approver, at the table or in the witness-box as the case might be, as the latter, with the reckless assurance of one who thinks he is the chief actor and object of attraction on the occasion, and only telling an amusing story to a crowded audience, discloses with terrible particularity the confidential words which had been whispered to him by the prisoner while they were watching in the grove, or behind the ditch, for the arrival of their unsuspecting victim.

The second day of the assizes arrived, and it was apparent that a trial of more than ordinary importance and moment was about to take place. The country-people, for it was market-day, congregated about the doors which led to the galleries that are set apart for the general public; and the officials, down to the crier, seemed oppressed with the sense of their own consequence. The hum of voices suddenly ceased; the words 'The judge is coming' were repeated from one to another; and soon, in dignified form, the Lord Chief-justice, invested in his scarlet robes and ermined cape, presented himself; and with a quiet courteous

* Charles Godfrey, junior, left the Scots Fusilier Guards some time since, and is now bandmaster of the Royal Horse Guards (Blue). Another son is a distinguished member of the Civil Service.

and gracious manner, he proceeded to take his seat upon the bench, where already were spread out before him a number of venerable-looking and portly volumes, supposed to contain precedents for everything.

'Put forward Brien Spelassy,' said the clerk of the crown in his most serious manner, addressing the jailer; and after a few minutes of suspense, heavy footsteps were heard from below the dock ascending the stairs of a dark passage, and then the man named stood in front of it; every gaze was directed, with what might be designated as the indecorum of curiosity, in the one direction. There he was at bay—an animal to be hunted down like an object of the chase; to be made the subject of speculation and inquiry as to his acts, and the inferences to be deduced from them; his life to be flung about from the battledore of one legal player to another; condemned to have his lips sealed as a witness for himself, and at the time in question, not even permitted to have counsel to speak for him. The prisoner cowered before the many faces that for him bore no traces of sympathy; and he bent down his head until it rested on the cold iron rail before him; but when the formal question was asked, after the indictment was read out, whether he pleaded guilty or not to the charge of the wilful murder of Ellen Power, with something of a defiant air, and drawing himself up to his full height, he firmly answered: 'I am not guilty; I am as innocent of her death as the child unborn. I had neither hand, act, nor part in it.'

It has been said, but certainly in somewhat of an exaggerated tone, that the great aim and end of the constitution is to assemble twelve men in a jury-box—men who are to be exclusively the judges of facts, and upon whose fiat depend the lives, the liberties, and the fortunes of their fellow-citizens. There is also the axiom that every person when accused has a right to be tried by his peers; not, indeed, the felon by a brother-felon, or the thief by a thief, but the humble man by one of an equal position in the social scale. But though the theory be a fine one, it is seldom it can really be carried out in practice. The wealthy grazier whose herds and flocks dot his pastures, and bring in a large revenue for himself and his children, can scarcely regard without an insensible bias in his mind the individual who stands before him charged with cattle or sheep stealing. The prosperous landlord will not have much favour for the tenant who is arraigned for shooting a brother-landlord or his agent, because his rent has been raised; and the honest merchant or the county gentleman would crimson with indignation were he to be told that he was the peer, or equal, of the shoeless, shirtless vagabond indicted for mistaking the goods of another for his own, and under the temporary hallucination converting them to his own use. However, on this eventful second day of the assizes, twelve gentlemen were sworn on the jury which was to determine between King George and Brien Spelassy the issue of life or death, and within the little area of a pent-up box to exercise one of the attributes of

supreme power. They could not, indeed, confer life, but their verdict was one which could take it away, and their grave and anxious countenances shewed that they were fully sensible of the responsibility cast upon them.

The leading counsel for the prosecution, Mr Charles Travers, was one of those clear-headed and cool personages not to be diverted from his purpose or thrown off his guard by any surprise, however unexpected. He was one who, if a volcano burst under his feet, would affect to regard it as a playful freak of nature, and scarcely condescend to brush the ashes or the lava off his boots. Opening his brief, after untying the red tape with almost provoking slowness, he proceeded to state the facts proposed to be given by him in evidence; and in his quiet colloquial manner of speaking, without any apparent exaggeration, there was far more of persuasiveness than if he had resorted to vehement appeals to the prejudices of his audience; and the impression he conveyed was that of a minister of justice who had a very painful duty to discharge in attaching guilt to any human being, but who had a paramount duty imposed upon him in the interests of society at large. The case, he observed, was one of which they had all doubtless heard; and the prisoner at the bar was charged as being a participator in the murder of Ellen Power; and on the same occasion her infant child was killed; but with that latter crime the jury had now nothing to do.

As Mr Travers stated the facts with cautious moderation, deprecating any conviction unless guilt should be clearly established, Maurice Power, who had been permitted to place himself in an angle of the court, between the seats reserved for the lawyers and the dock, and who could see and hear everything that was passing, without at the same time occupying any prominent position, could scarcely refrain from interrupting the speaker as he heard such deprecating words. 'Why,' he reasoned, 'should the counsel for the crown admit anything that might influence the jury in favour of a criminal?' and he muttered words: 'Can the pass be sold on me? It is money must have done this,' was fortunately so indistinct that no one collected the import of the words, which were only so far audible as to draw down from the crier the warning: 'Silence in the court!'

The crown counsel proceeded to dilate upon the natural horror which the crime of murder excited among all nations from the earliest period of even sacred history; and that the most polished community of antiquity so execrated the taking away of life, that the judges deliberated under the canopy of heaven and in the silence of night, as they considered the very walls of any edifice would be polluted by the presence within them of an assassin. There might have been also another reason for the adoption of such a mode of trial—namely, lest the appeal made to their feelings by the supplicatory looks of the culprit should sway their judgment. Passing from such general topics, Mr Travers said he would detail in few words the facts which were considered to establish the guilt of the accused. The murderers were three in number at least; but the utmost vigilance of those acting for the prosecution had obtained no clue by which to discover the third member of the party. The object of these ruffians was plunder; for the poor girl who became their victim was one

against whom no motive could be suggested for entertaining hostility; but possibly from being alarmed by some sudden noise while searching the cottage, or owing to her resistance, and a suspicion that she might have recognised one of their body, the robbery was accompanied by a deed which no words could too forcibly denounce. The husband of Ellen on the morning of the night in question had left their home to obtain at Clonmel a loan of money to augment a sum which it was known he kept in the cottage; and the prosecution would produce before the jury the afflicted and bereaved widower, who could shew where he had been during that momentous day and evening; and detail what he saw on his return to the Glen, which was a very secluded spot through which few passed, as it led to no village or hamlet, and to no frequented pathway. On one point the evidence of this witness would be no doubt confused, and that was as to what happened to him while he was in the public-house or tavern of a Mr Meagher, who was a wealthy individual, a money-lender, and if report spoke true, a hard but respectable man; and it was but fair to the prisoner to throw out the suggestion that possibly Power had taken somewhat more drink than was advisable, in that or some other place in the town, and the influence of which might not have entirely passed away when he left Meagher's house for the Glen. But there was no question that a sudden great shock, or an appalling incident, could at once restore the mind to all its original powers of observation and thought; and when the husband proceeded up the borgen or lane leading to the farmyard, and when he heard the steps of the murderers at that unwonted hour of night, he became himself again in all the integrity of an unclouded reason. What then occurred? The accents of one person left an indelible impression upon his ear; and although the words spoken on that occasion were few, they were most significant; and the witness would swear beyond any question or doubt that the voice he then heard was that of Brien Spelassy, the prisoner at the bar; and that he had at once recognised it, after months had passed away, at a place and at a time when there was nothing to suggest inquiry or awaken any suspicion against the accused.

The advocate for Spelassy was Mr Supple, considered to be a very rising junior of twenty years' standing at the bar, quick, sharp, loud-spoken (a great merit in the estimation of the country people), and with a more than due estimate of his own abilities, although not a very profound lawyer; and when he heard what was meant to be relied on as so important a proof in the chain of evidence, he smiled with a contemptuous air, and proceeded with elaborate care to wind his watch and set the minute-hand forward.

This little piece of forensic acting did not escape the observation of his adversary; but he considered it more prudent not to notice it, and therefore went on to observe that even if he were in a position to prove no more in the case, there was quite enough to entitle the crown to ask for a verdict of guilty, unless the man at the bar could prove by trustworthy persons that he was at a distance on the night in question. But it would be further established by the testimony of a young girl of unimpeachable character and great intelligence, that her cousin John Dwyer had formed an

acquaintance with the prisoner; and two evenings before All-Hallow's night the latter had come from Clonmel to Mulla, a considerable distance, apparently on no business; and after much persuasion, Dwyer was induced to leave the village in his company; and was from that time never heard of until his dead body was found under circumstances which would have a very material bearing indeed upon the other facts to be brought forward. 'It might be said,' continued Mr Travers, 'by my learned friend who sits beside me, that the meeting of the two men and their leaving together, although suspicious, went but little way in attaching guilt to the accused. So able a counsel'—

Here Mr Supple, the gentleman in question, nodded assentingly, as if the epithet was his exclusive property, and he felt gratified that it had been restored to him in so public a manner.

'So able a counsel,' repeated the speaker, 'might put forward his views to the extent of urging that it was quite consistent with the truth that the two men soon separated after they left the village of Mulla; but there were persons on the road who recollected seeing them together very near Clonmel, and that Dwyer was afterwards at the place of the outrage, would admit of no controversy. It was at the Glen farm cottage he met his death. While assisting the prisoner and his unknown confederate to plunder and slay, an avenging hand was there raised against him; and the man who grasped the weapon by which he met his death was none other than the bereaved husband of Ellen Power!'

A wail of agony, appalling in its distinctness, as these words were spoken, rang through the court, and for the moment scared every auditor, and then the heavy fall upon the ground of a girl who had been standing on some steps near the dock added to the natural excitement. The crowd, however, gathered round her, and with gentle hands lifting her up, carried Mary Dwyer, bleeding from a wound in the temple, into the open air.

'I was observing, gentlemen of the jury,' resumed Mr Travers, 'when interrupted by what has just passed before your eyes, upon the remarkable fact that the prisoner will be demonstrated to have left Mulla with this Dwyer two evenings before the fearful outrage which we are now investigating; that he was seen in his company a few hours before its occurrence; that Dwyer was killed in the bedroom of the cottage just after Ellen Power was basely assassinated; and it was then, in order to prevent their guilt being traced by the body, which would have been left in the hands of justice, that, no doubt with great labour and difficulty, his associates conveyed it to the cave, in which, through the agency of Providence, it was finally discovered. What further was there in the case? A search-warrant was granted to examine a room in Mr Stephen Meagher's house which it had been previously ascertained was in the exclusive possession of Brien Spelassy, and the door of which he always kept jealously locked, if he only left the house for a few minutes. When the constables came to institute their search, Spelassy, in the first instance, represented to them that he had lost the key; but it was found under the chair in which he had seated himself; and along with it another of a smaller size, which opened an old-fashioned drawer, fitted into a deep recess beside the window. In that drawer a large sum of money was

discovered, far beyond what reasonably might have been expected to be in the possession of a person in his position in life; but in addition, a number of forged bank-notes, which might account for his frequent visits to fairs when having no ostensible business in such places, and his readiness to oblige illiterate farmers, as he did at the fair of Mullin, by counting up the money and notes received by them for their cattle and other stock.'

The legal indignation of the prisoner's counsel could not be restrained as this latter statement was made, and addressing the judge, he said: 'My lord, I am most reluctant to interrupt my learned friend, but he should not make a reference to what he designates as the discovery of supposed forged notes. There is no such charge in the indictment, and, of course, could not be, and the statement in question is not only irrelevant but illegal.'

A long discussion arose in reference to this objection, which certainly did not interest the general audience. On this occasion the discussion ended by the dignified personage appealed to satisfying neither side, 'hoping that Mr Travers would carefully avoid mentioning anything which might afterwards be excluded when tendered in evidence, but at the same time deciding that the finding of the notes, if shewn to be forged ones, was a portion of the whole transaction, and therefore could not be excluded.'

'I think I shall not be interrupted again, unless there be some real necessity for it,' remarked the advocate for the crown, for an instant forgetting his usual calmness; 'and I now proceed to mention a circumstance which, in my humble opinion (but that, gentlemen, is subject to your better judgment) is, when taken in connection with the other proofs, conclusive of the guilt of the man in the dock.'

As he thus spoke, the cheek and the lips of Spelassy blanched; his eyes were rapidly directed to each portion of the court to see what effect this announcement created; a sickly smile of assumed incredulity and indifference played across his mouth, giving way, however, almost instantly to a rigid expression. He muttered something to the turnkey who was standing beside him, and then looked to his counsel, as if there to ascertain whether he had anything more than ordinary to fear; but Mr Supple seemed to be wholly engrossed in the perusal of a letter, acting his part at this juncture, for could a person have then glanced over his shoulder, he would have discovered that the letter was reversed in his hands, literally turned upside down.

'I need scarcely remind jurors of your experience,' proceeded Mr Travers, 'that it is the usage—a usage derived from the remotest periods of antiquity—when country-people pledge their troth to each other, to break a gold or silver coin, each part of which is preserved with the most superstitious care; and now I produce for your inspection one half of a coin which the fond husband of the poor victim whose death we are inquiring into, always kept on his person from the hour when Ellen Morrissey pledged herself to become his wife.'

Here the sensation rose to fever-pitch, and many were the eyes now strained forward in the endeavour to catch a glimpse of the coin, while, with tantalising delay, the numerous folds in which it was wrapped up were removed and carefully

laid aside on the table. The love-token was handed to the judge, and then to the jurors, and examined with almost feminine interest and curiosity. It was a portion of one of those massive Spanish dollars which foreign traders to the port of Waterford were formerly in the habit of exchanging for the butter and eggs of the country-people who came to the market on each Saturday; and the coin having been unequally broken, some jagged edges were apparent where the severance had taken place.

'And now,' resumed the speaker, in his most impressive accents, 'the significance of that record of the affection of these humble people will be at once understood when I mention that on the night when Ellen Power met her untimely death she had the corresponding portion of the dollar secured round her neck in a leathern purse, together with a number of guineas which her husband had given into her charge when leaving the Glen for this town; and that identical purse, but emptied of its contents, was afterwards found on the body of John Dwyer; and here is the part of the broken token which the wife had with her on that fearful night. Where was it found? you will at once ask. It was found locked up in the drawer belonging to the prisoner, and to which depository he alone could have had access. What link in the evidence is now wanting, I may confidently ask? The irresistible inference to be drawn from this discovery, no casuistry, no legal skill, or eloquence can meet or answer.'

That the two pieces of the dollar fitted together, and had originally been part of the same coin, could not, indeed, be questioned when examined by even the most casual observer—the undulating projections of one sank into the opposite cavity, and a flaw in the casting passed like a fine thread from rim to rim.

There is inherent in our natures a love for mysteries and surprises, and too frequently it is found that an undue importance becomes attached to circumstances which have the appearance of romance in them, and lift us out of the ordinary incidents of life; and an uneasy, disquieted look was visible on the countenances of the twelve men in the jury-box, as if they were becoming impressed with the conviction that escape from the discharge of a painful duty was not possible; but the astute advocate of Spelassy turned with a smiling aspect to his forensic adversary, and said: 'Were it not that admissions cannot be made in a criminal case, I would be ready at once to dispense with your proving that the love-token was the one so exchanged and religiously preserved by both husband and wife. Indeed the fact is obvious.'

'What on earth can be his defence?' was the thought which flashed across the mind of Mr Travers; but stimulated by the zeal and desire for success which even prosecuting counsel may feel, although the stake played for be the condemned cell or the free air, he proceeded with masterly skill to link together every slight incident in addition to those which were of such serious and startling import; and when he had closed his address, contrasting what had been the happy home of Maurice Power and what was to be his desert future of existence—an outcast, alone in the world—a subdued thrill of emotion ran through those who were listening to his words; and all seemed to be assured that in a few brief hours the

hardened being in the dock would know more of the great and awful secrets of a future world than all the gifted living poets and philosophers with their lofty intellects and noble aspirations.

(To be concluded next month.)

OURSELVES AS OTHERS SEE US.

I AM inclined to think that every man is the best judge of his own character, and that every nation knows its own strong and weak points. And yet we should perhaps get on badly without the candid friend to tell us now and then an unpleasant truth, and the indulgent friend to give us words (also wholesome if judiciously administered) of encouragement and appreciation. Towards the nation, the intelligent foreigner fills these rôles. On the whole, I think England has no cause to complain of the remarks made upon her. There may be a few who, like the learned Snellfungus, 'travel from Dan to Beersheba,' and say 'It is all barren'; but from Froissart to Erasmus, from Erasmus to Bunsen, there have been many who have looked at England with kindness as well as interest, and who have been quick to acknowledge her merits with no grudging praise.

The earlier travellers throw a valuable light upon manners and customs likely to be passed over in silence by native authors to whom they are perfectly familiar. Many, both early and recent, reflect a light upon their own country; thus, from reading the *Shah's Diary* we may form a good idea of the present condition of Persia. To give a few more instances of this. When the Baron de Pöllnitz, who visited England in 1733, remarks with satisfaction that torture is not employed, not even in cases of conspiracy, it reminds us of the barbarities so long practised in other countries. In France, *la question préparatoire* was not abolished till forty-seven years later, and torture was not completely dispensed with till the Revolution. In Russia it was legal till 1801. When Nathaniel Hawthorne remarks in nearly every page of his *English Note-book* upon the green mantle of ivy which here makes beautiful the most unsightly objects, we remember that tumble-down walls and blasted trunks have in North America no such decent covering under which to hide themselves.

It is pleasant to find that our visitors of all nations speak continually of the kind and hospitable treatment they receive. In this respect we have improved since the days of Froissart, when, as he tells us, 'the English were so proud and haughty that they could not behave to the people of other nations with civility.' But a certain coldness of manner is complained of. There are Englishmen, or at least there were in 1733, who seem on particular days not to recognise those with whom they have been living the evening before. The observer was at first inclined to attribute this to English pride, but at last good-naturedly concludes that it is 'the effect of a melancholy humour, which is spread over nearly the whole nation.' Are we really so very melancholy? It is consolatory to hear that Simond, a Frenchman who, in 1810,

visited England after a twenty-two years' residence in the United States, finds us much more cheerful than he expected. He is surprised at the way in which a joke is welcomed in the House of Commons, and finds an animation there that he was not prepared for. Not, indeed, that it is quite as lively as the American Congress, where in his day two members engaged in a regular combat with fists—may, even with the poker and tongs—and the Speaker left the chair to give fair play. But to Frenchmen, our very mirth appears serious. What amuses us does not amuse them. M. Taine makes a frantic attempt to understand and explain English humour, but few will think that he has succeeded. 'Generally,' he says, 'it is the pleasantry of a man who, though joking, maintains his gravity.' He 'who jests here is seldom kindly, and is never happy; he feels and forcibly censures the inequalities of life.' That there is much of this humour among us, a humour that helps us to put into a palatable form that continual abuse of ourselves, which is another great wonder and puzzle to foreigners, I do not deny; but surely we are not without some of a more genial kind, some that does not 'leave an after-taste of vinegar.'

But this and a few other mistakes and much flippancy we may forgive M. Taine in gratitude for what he has done to make English literature known and appreciated in France. Voltaire was the first Frenchman to discover some merits in Shakspeare, indeed he did him the honour to borrow his *Zaïre* from *Othello*, but before his death regretted that he had led the way, when he saw Ducis following with versions of *Hamlet*, *Romeo and Juliet*, and other plays. Acquaintance with our literature did not, however, spread rapidly. Simond, in 1810, says: 'The French have heard no doubt of some of the English writers—they know that Newton was a great mathematician; that Pope wrote an *Essay on Man*; they admire Young, whom nobody reads in England, and being *d'un beau noir*, they think it quite English; Shakspeare they understand has written a number of barbarous tragedies, and Milton a mad poem on *Paradise Lost*: add to these two historians, Robertson and Hume, and you will have the main body of English literature, lost in a crowd of English novels fabricated at Paris.' And Simond himself, whose long stay in America had made him perfectly familiar with our language, and who actually preferred the literature of England to that of France, speaks of Shakspeare in a way that would make a modern critic's hair stand on end. Hamlet is in his opinion 'one of the most ill-conceived and inexplicable of his plays;' but he suggests that things might have been better had the English bard had the good fortune to be born 'a century later, before taste was over-refined, and when it had ceased to be barbarous.' A well-educated Frenchman would now, I think, speak more respectfully, and Victor Hugo no doubt intended a high compliment when he called Shakspeare 'his intellectual twin-brother.'

Let us now come to something that touches us more nearly—what foreigners have thought of Englishwomen. To begin with: they have, it seems, a great talent for silence. 'The other day I was visiting,' says the Baron de Pöllnitz, 'at a house where there were twenty women and not one man. They looked at each other and said not a word. Find me elsewhere if you can,' he exclaims, 'twenty

women thus staying quiet.' Simond says: 'Women do not speak much in numerous and mixed company;' and M. Taine is told of a lady of the highest class, accustomed to important ceremonies, 'and who becomes dumb and blushes when a stranger is introduced to her.' When women meddle in politics they are (or were in 1810) still more violent and extravagant than the men. Their want of taste in dress is a sore trial to foreigners, and M. Taine seems a little doubtful whether the very robust health that they enjoy is consistent with perfect refinement. In him, however, literary ladies have found a champion, though it is evidently rather a surprise to him to discover that authoresses may be pleasing and natural. I do not think he was quite correctly informed by the friend who told him that no 'well-brought up woman reads journals of the fashions.' While European writers wonder at the liberty which young ladies are allowed, Americans make the very opposite remark. In this matter English custom has adopted a medium course; may we say the happy medium? Hawthorne delivers his verdict upon Englishwomen in this oracular sentence: 'It is certain that a woman in England is either decidedly a lady or decidedly not a lady.' He sees a set of school-girls of the lower class, and talks of their 'stubbled sturdy figures, round coarse faces and snub noses;' they are quite wanting 'in the slender elegance of American youngwomanhood.' Possibly, however, they had something to compensate them, for we are told they looked 'wholesome,' which is, if I mistake not, American for 'healthy.'

It is strange that our nearest relations, who so much resemble us—the Americans, are by no means our most favourable critics. Mr Hawthorne is much less pleased with Englishmen than M. Taine. According to the former, 'an Englishman of genius usually lacks the national characteristics, and is great abnormally.' 'Success makes an Englishman intolerable;' 'in adversity,' Mr Hawthorne concedes, 'he is a very respectable character; he does not lose his dignity, but merely comes to a proper conception of himself.' Further on we are told that 'the English are a most intolerant people and that there seems to be very little difference between their educated and their ignorant classes in this respect.' Even our personal appearance comes in for a share of Mr Hawthorne's criticism; he talks of a 'three-cornered English nose.' There is one thing, however, and perhaps one only, of which he takes a more favourable view than M. Taine, and that is our weather. While the Frenchman complains that 'the intercourse is perpetual between the moist sky and the moist earth,' the American thinks that English fine weather is the best weather in the world, or at least that there are only a few days in an American October that can be compared with it.

There is one subject on which all our visitors seem to be agreed—the beauty of English scenery. Let those who are too ready to pass over the quiet loveliness at home, and think there is nothing nearer than Switzerland worthy of their raptures, lay some of these observations to heart. Pollnitz 'cannot understand how people born in England, and possessed of a certain amount of fortune, can make up their minds to leave it for countries less favoured by nature;' and he mentions as one of its greatest charms that you 'see there no miserable peasants; all are well housed, well

clothed, well fed.' One might almost imagine that Mrs Hemans's poem on the *Homes of England* was composed by some enthusiastic foreigner. Our gardens, or more properly pleasure-grounds, 'shew the poetic dream of an English soul.' 'The beauty of English scenery makes me desperate,' exclaims another observer; 'it is so impossible to describe it, or in any way to record its impressions, and such a pity to leave it undescribed.' What might he have said of some of the scenery in the Highlands of Scotland!

M. Taine ends his account of England with the consideration of this question: Which of the two forms of civilisation is the more valuable, that of England or that of France? And he answers that each has the superiority in three things. The three things better in England are: the political constitution, religion, and the greatness of acquired wealth, combined with the increased power of producing and amassing—no trilles certainly. The three things better in France are: the climate, the distribution of wealth, and domestic and social life. The truth of this last assumption of superiority we may not all be willing to concede, and the English side of the question might be well argued from data supplied by M. Taine himself. But this would lead us to a discussion too long and too deep; and it is time for me to conclude this feeble attempt to represent England as she appears reflected in the mirror of foreign opinion. I have not even mentioned the names of many authors who might have assisted me. Madame de Staël; the American minister Rush; Barillon, so often quoted by Macanlay; those Venetian ambassadors who sent to their republic such minute and curious reports from Henry VIII's court—all these and many more would furnish to any one seriously attempting the subject much information both valuable and interesting. I have but skimmed over the surface of a theme that is susceptible of widely different treatment.

NIGHT-FISHING OFF THE STAGS.

CADGWITH is a pretty cove on the south coast of Cornwall, a mere fishing hamlet, but of great importance in its own estimation. It has two separate 'pilchard concerns.' In the crabbing season it sends out twelve or fifteen boats in search of this voracious shell-fish, and it is a coast-guard and lifeboat station. Some few enterprising tourists come here in the summer to enjoy the balmy air and the lovely cliff scenery—those cliffs, with their deep shadows and splendid colouring, towering up some two hundred feet from the dark-blue sea. It is difficult to correctly describe the tints on these rocks. The serpentine which composes them, and is peculiar to this coast, takes deeper and richer hues than even the red sandstone of South Devon, while above the 'spray-line' the dark corners of the stone are bright with patches of golden lichen. After all, perhaps, the Cadgwith people are right to be proud of their village, for approaching it from inland on a bright summer morning, it is hard to imagine a more lovely spot. Two hilly paths drop suddenly down from either side upon the little hamlet, amongst white-thatched cottages and gaily-painted boats,

and the whole place is alive with colour, bustle, and sunshine. But it is not at a time like this that I wish you to think of Cadgwith. Picture to yourself this same cove at the end of December. There is a slight coating of snow on the ground and on the roofs, while on the pools far across the Downs, all day, and even for the last week, the ice has borne for skating; a rare occurrence in South Cornwall. It is eight o'clock in the evening, and the moon has just risen as I come down to the cove arrayed in jersey, thick coat and trousers, and sea-boots, over all of which to draw a suit of 'oilers.' This precaution is indispensable, as it not only keeps the wearer dry, but also protects him from the wind as no cloth clothing can do. 'Where are the three Trepolpens gone?' (they are the three brothers with whom I am to fish to-night), I ask of some coast-guards loitering near the lifeboat station.

'Gone away up to the eastward, sir,' is the reply; 'been gone since four o'clock getting bait; but it is high time they were back if they mean to go out to-night.'

As the man stops speaking, a boat shoots round the point from the shadow of the cliff into the middle of the cove.

'That's the Trepolpens' boat,' I cry; 'let us go down and give them a haul up.'

We run down to the shore, and in a minute or two the boat is high and dry. They have had a very successful afternoon, having secured twenty-two cuttles, than which 'fish' none is in greater repute for night-fishing bait.

It may not be uninteresting to mention here the manner of procuring cuttles. A boat is pulled slowly through the water with a short light line trailing behind, to which is attached a piece of fish. The man in charge of the line can tell by the increased strain the moment the cuttle has taken hold of the bait; he then proceeds to haul in very gently, as the least roughness will shake off the 'fish.' As it comes alongside, he gets ready the gaff, consisting of a rod with several hooks at the end, and if possible gaffs his victim. If this is done carefully, well and good; but if by an unpractised hand, the performer will probably be deluged with a thick inky fluid, which is secreted within the cuttle, and seems to be its natural means of defence.

But I must return to my story. We remove the bait into one of the larger boats, launch her, then getting in silently, take our places each at an oar. The boat is a heavy one, but four oars send her through the water at a very fair pace, and we are soon outside the cove, steering for the Hot Point. What a splendid moon! No fear of a collision to-night, as there was last time I was out, when we were nearly run into by a pilot cutter coming down before the wind, and almost frightened overboard by a big steamer passing within fifteen yards of us. We can see the cliffs plainly, and hear the waves as they lap against their stony face. There is Polbarra, a lovely little bay, where every day in

the season the seine-boats lie at anchor waiting for the pilchard to come by; and there is Church Cove, with the pinnacles on the tower of Landewednack Church just shewing above the hill. And now we spin along, for we have got into the race of the tide; and in a few minutes we are round the Hot, past Penolva, and half-way across Househole Bay. Not a mile off on our starboard bow are the great twin lighthouses known as the Lizard Lights, warning ships off the terrible Stag rocks, over which they keep constant watch and ward. Many are the stories which the fishermen tell of the wrecks that have occurred on these rocks in spite of the lights. I myself have seen several, one ship taking barely half an hour to go to pieces.

We have, however, now reached our fishing-ground, or rather water; the anchor (a heavy stone with a line attached, and termed the 'killick') is let go, and we commence our night's work, it being almost ten o'clock. We are situated close to the easternmost branch of the Stags, and about a mile from the shore. The first thing to be done is to get the lines out, bend on suitable hooks (which are themselves fastened on to strong cord and bound round with fine wire, to prevent the conger biting through them), and choose leads, which, as the tide is not now running very fast, need not be heavy. One-pound leads are fixed on to the lines in the stern, and two-pounders on to those in the bow; and the cuttle are cut into pieces, after having been well beaten, to make them soft and palatable to the cod, who are very dainty feeders. Before throwing the line over the side, do not forget—excuse me, gentle reader—to spit on the bait, for, in the estimation of a Cornish fisherman, you might as well have no line over at all as throw over a bait not so prepared. You must not drop a crab-pot or put out a bait of any sort without first spitting on it, 'for luck.' Now we sit on the look-out for a bite. My companions are old hands at the work, and are as calm while hauling up a fifty-pound conger as most people would be over a two-ounce trout. But I confess that I get very excited when I feel the downward drag, threatening almost to pull you out of the boat, and signifying conger; or the sharper tug which tells of cod or pollack. No. 1 in the bows has a bite; you can see that by the way in which he rises from his seat and takes a couple of turns of the line round his hand, to be in readiness when the time comes to strike. Suddenly he gives a long quick haul, and then begins pulling in rapidly.

'Be smart there with the gaff; it may be a big conger.'

But no; it is a twelve-pound cod; a nice little fellow for a dinner-table, but nothing astonishing. Ah! I have a bite now, and it feels like a conger from the way in which it surges downwards.

'Let him have it,' says one of the men; so I wait patiently for a few seconds, and then, with a mighty haul, I strike my fish and begin to pull him in. Often I have to stop from sheer inability to pull harder than my antagonist, and once or twice a yard or two of the line slips through my wet fingers; but at last he comes to the top, a splendid conger, some six feet long, and weighing thirty pounds, if an ounce. Look at his jaws and his teeth! I should be sorry for any poor fellow who got his hand in there. How he lashes the water with

his tail; but now the gaff is through his neck, and he is hove gurgling and grunting into the boat. The hook is extracted by means of a slit made in his throat with a knife, for no fisherman, however dead the conger may appear, will trust his hand in the brute's mouth.

Now that we have made a good start, the cod and pollack come up very fast. It is getting bitterly cold, for the morning is coming on, and I cannot help thinking if one could catch cod and conger in the summer-time, how delightful it would be. After a look at my flask, and a fresh pipe, I proceed to haul in my line again, at the end of which I feel a fish struggling. It is a fine ling, weighing, as near as we can judge, about twenty-five pounds; what they call down here, a 'nice handy fish!'

We remained in this place till nearly two in the morning, when, as the fish began to bite less freely, we 'up killick' and pulled farther out. Here our good luck returned, and we caught more than a dozen large fish, chiefly cod. It was now six o'clock, the moon but just above the western horizon, and a gray light was beginning to appear in the east. Why disguise the truth that night-fishing is not unalloyed pleasure, and that it was piercingly cold? My feet, ears, and nose, I knew nothing about; but the rest of my body felt the cutting wind, which had sprung up in the night, most acutely. Added to this, I had been up all night, and now that the excitement was nearly over, was almost asleep. My hands were pickled with the salt water, and to touch anything with them was agony. The fishermen's hands become, I suppose, hardened to the salt water, but to me it has always been a source of great discomfort for several days after a night of this work. Half-past six. We shall get no more fish now; so we haul up the lines and the killick, get out oars, and begin our pull home.

Cadgwith looks very gray and dull in the morning. There have been several boats besides ours out to-night, and two of them have returned, and are throwing out their fish on to the beach as we row into the cove; the wives and elder children of the fishermen are down on the shingle helping. We pull our boat ashore, jump out, and commence emptying her of the fish. There are fifteen cod, eleven pollack, five conger, and two ling; in all, thirty-three fish—a very good catch. We haul up the boat; and with a twelve-pound cod—which the Trepolpens have kindly presented to me—in my hand, I make the best of my way home, to get a couple of hours' sleep before turning out to the business of the day, which, considering the frost there had been in the night, can be only skating.

So ended my night's fishing, of which I have attempted to give you, my readers, a rough description. I have tried my hand at a good many different sorts of fishing; from catching minnows with a pin and a bit of thread in a stream I could jump across, to catching bonita and even sharks with a sail hook and small rope in the South Atlantic; but of all the variations of the gentle (?) craft, I still—its discomforts notwithstanding—prefer night-fishing off the coast of Cornwall! As for the place itself, which I have feebly attempted to portray, let me advise any one who has not been there already, to proceed to the Lizard, and spend a week or two

there: the traveller will be fully repaid for a rather tedious journey, by the beauty of the cliff scenery, and the unqualified excellence of the boating, fishing, and bathing.

THE MONTH:

SCIENCE AND ARTS.

THE *Transactions* of the Scientific and Mechanical Society of Manchester contain an instructive account of the mischief occasioned by locusts in Missouri in 1875. Not only were growing crops of grass, grain, and vegetables devoured, but fruit-trees were stripped of leaves, twigs, and fruit, and from many young trees the whole of the bark was gnawed, and the whole country looked 'dry and verdureless as a well-beaten road.' The insects took their departure on June 20, and it seemed as if nature made haste to repair the havoc, for large breadths of grass sprang up and yielded good pasture, but produced no seed. In place of numerous weeds which had been eaten away, purslane (*Portulacca oleracei*) grew abundantly, 'occupying entire fields, and even yards, and roadsides, and waste ground, where it had not been seen before. *Phytolacca decandra* (poke-weed) was also very abundant; and what seemed curious was, that most plants appeared gregarious, only a single species, but in great numbers, occupying a certain space.' The common nettle, too, grew up everywhere and on every kind of soil; and the sand-burr, *Solanum rostratum*, intruded nearly to the same extent. This last-mentioned plant was unknown in Missouri a few years ago; now it has penetrated seventy-five miles into the state. These facts appear to be deserving of the attention of naturalists.

A Society for the promotion of agriculture in the state of Massachusetts, desiring to encourage tree-planting and the re-foresting of poor or agriculturally worthless lands in that state, have offered prizes for the best plantations of larch, pine, ash, and other trees suited to different localities and soils. The prizes range in amount from four hundred to one thousand dollars; and to facilitate the carrying out of the project, special instructions have been published for the guidance of competitors. And we are informed that 'a citizen of Boston patriotically offers to look after the importation of the seedling trees, which in such quantities and for next year's planting would have to be obtained mostly in Europe—at least the pines and larches.' This will be an interesting experiment, inasmuch as it combines embellishment and economy. If Massachusetts can be beautified with profit, so much the better for all concerned.

Grape-vines in America are infested by a mildew, the commonest form of which, in New England, is the *Percnospora viticola*. It attacks every leaf; but strange to tell, the vines do not suffer. We are informed that the mildew does not touch the grapes; that its effect on the leaves causes them to wither by the beginning of September, and that the sunshine has then room to penetrate and ripen the fruit. This ripening, it is asserted, could not take place if the leaves retained their

original luxuriance; and as the vines live on year after year apparently without injury, we may assume that the mildew is not harmful but beneficial.

As is now generally known, the Eucalyptus, or gum-tree of Australia, is said to prevent fevers and other noxious influences in the districts where it is planted. A chemist has obtained from the leaves a heavy, fragrant, resinous oil, and he finds that the main constituent of this oil is a homologue of camphor.

Professor Thiselton Dyer, of the Royal Gardens, Kew, has examined the plant which produces Latakia tobacco, and finds it to be a different species from that which produces the Turkish tobacco. The Latakia tobacco, as imported into this country, consists of the flowering twigs of the plant tied tightly in bundles. The dark colour and aromatic flavour of these bundles arise from their having been hung up for some months in the smoke of a species of pine-wood which grows in Syria, and is burnt by the tobacco-growers for the purpose of fumigation.

As elementary education continues to be a subject of discussion, we mention that some months ago suggestion was made that the telegraphic alphabet should be one of the subjects taught in elementary schools. The alphabet here in view is the Morse alphabet, a series of dots and dashes, so simple that even children may learn it. Moreover, it is known wherever telegraph wires extend, and in case of necessity can be used independently of electricity. Morse signals may be sent to a distance by the movements of the hands, or of a pole during the day, and by lights at night. Mr J. A. Russell, who brought this subject before the Royal Scottish Society of Arts, remarked that 'the necessity for a universal acquaintance with some such simple plan on the part of all seamen is only too frequently shewn around our coast. To recur to one instance: it may be remembered that when the *Northfleet* was run down, some other ships refrained from sending assistance, being misled into supposing there could be nothing amiss because they saw the lights of the *Northfleet* burning steadily; and so, many persons perished for lack of the little knowledge required to make those very lights call for help.' That the question is worth consideration is obvious, and though it was mooted last year, we may without impropriety call attention to it in the present year.

Everybody knows that the noisiness of the world has been enormously increased by railways. It is impossible to travel now without fuss and uproar. Much of the noise is inevitable; but much is avoidable: slamming of carriage-doors, for example. The noise of slamming irritates the nerves and injures the health of passengers, and is a reproach to railway management. Surely it would be possible to contrive a self-acting latch that would allow doors to be shut without a slam, and surely railway managers might be persuaded to adopt them. We hear that a 'self-acting safety-lock' was described to the Scottish Society above mentioned by Mr J. Maxwell of Dundee.

From experiments made by the Great Northern Railway Company of France and by a manufacturing firm at Mülhausen, the electric light seems likely to be available for practical uses; and what is more, we are told that the cost will not be more

than half the cost of oil or gas. The enormous hall comprising the luggage department of the railway was lighted by a single electric lamp, which burned steadily the whole evening. The source of the light was a Gramme machine of three-horse power; and if, as is stated, the Company intend to light up the whole of their station in the same way, it may be a conclusive experiment as regards economy of artificial light. The test experiments were made by Mr Trese, a well-known man of science, and may therefore be regarded with confidence.

The extension of telegraphs in Australia has been so active, that nearly the whole sea-coast of that great country is now furnished with wires, and the several observatories get every day reports and signals from all the observing stations, and thus are made acquainted with the general state of the weather over thousands of miles. The overland line from Adelaide to Port Darwin is especially serviceable in determining the southerly march of the north-west monsoon, which at times makes its influence felt in heavy thunder-storms across the entire country. When news of rain can be sent by telegraph, owners of sheep and cattle will not have so much reason as formerly to dread the droughts. They will drive the animals to the nearest district where rain is falling.

A paper by Mr Barrett, read at a recent meeting of the Odontological Society, advocates the use of carbolic acid in the treatment of decayed teeth. The cavity having been properly cleared out, is plugged with cotton-wool which has been soaked in carbolic acid, and the usual metal filling is then put in, whereby the antiseptic properties of the acid are retained perhaps for years. The same remedy may also be applied to cases in which the fangs of the teeth are inflamed; and among dentists it is acknowledged that in carbolic acid they have a powerful and efficacious means for relieving the distressing pain occasioned by diseases of the teeth.

Mr Lawrence Smith, of Louisville, Kentucky, a well-known experimentalist, has made analyses with a view to determine the true composition of the black substance found in meteorites in a form resembling graphite, the existence of which he regards as 'a grand chemical and physical puzzle.' He has not reached the solution; but he says: 'So far as our present knowledge goes, we know of celestial carbon in three conditions—namely, in the gaseous form as detected by the spectroscope, in the attenuated matter of comets; in meteorites in the solid form, impalpable in its nature and diffused in small quantities through pulverulent masses of mineral matter that come to the earth from celestial regions; also in the solid form, but compact and hard, resembling terrestrial graphite, imbedded in metallic matter that comes from regions in space.'

The Franklin Institute of Philadelphia appointed a committee to consider the question of 'petitioning congress to fix a date after which the metric weights and measures shall be the only legal standards' throughout the United States. There are many advocates of the French system in all civilised countries; but the committee, in their Report, have decided against it, for reasons derived from history and from daily practice. 'The mètre,' they say, 'is really as arbitrary a standard as the foot. About eighty degrees of latitude have been measured, but no two of them have been found of

the same length, and there is good reason to believe that the length is not permanent in the same place. The only real thing about it is the rod in the public archives. The length of the mètre, if lost, is to be recovered by comparison with the length of the seconds pendulum, and so likewise is the length of the foot or yard.' They say further that the 'mètre in any shape is a less convenient instrument for measurement than a two-foot rule'—that 'by changing their unit of lineal measure for the sake of uniformity with France, they should sever their uniformity with Great Britain, a country with which three-fifths of their foreign commerce is transacted'—that the cost of a change would be enormous, and that 'the great mass of English technical literature would become almost useless, and must be translated from a language which we (that is, the Americans) and the nation we have most to do with understand perfectly, into a new tongue which is strange to most of our people.' Some readers will perhaps remember that the late Sir John Herschel and others of our leading men of science declared against the adoption of the mètre, and shewed that the foot or yard was in all respects a more convenient measure.
